This combination is designed for one and two-room kitchenettes where rental rate will not justify expenditure for more elaborate equipment. It combines, in a 6-ft. space, refrigerator of 4.80 cu. ft. capacity, four-burner gas range with oven and separate broiling compartment, three storage cabinets, two cutlery drawers, vented canopy to carry off cooking vapors, and grille beneath sink for storage of pots, pans and fresh vegetables.

Combination No. 275 can also be furnished in widths from 5 ft. to 6 ft. 6 in. It can be furnished in any of the standard "Rocksteel" colors.

Specifications—Unit R 24-35 Refrigerator, 1-door type, hinged left.

Unit C 2/2-12-24 Wall Cabinet.

Unit D 2-12-24 Wall Cabinet.

Unit D 2-12-24 Wall Cabinet with 4-in. center vent pipe.

Unit H 24 Canopy.

Unit Splash Back, 12x25 in.

Unit Aluminum Shelf, 6x24 in.

Unit Splash Back, 24x72 in.

Unit Porcelain Drain Top, 21x24 in., back up 2 in., right-hand lip.

Unit 24-in. Grille Front with return on right side.

Unit No. 4 B Gas Range.

Unit 24x20-in. Roll Rim Sink, furnished by others.

Furnished either right or left hand.

Model "C" Venetian Bathroom Cabinet**Specifications—**

Three adjustable glass shelves.

Finish: white lacquer, or special colors on request. 20x32-in. beveled mirror.

Face dimensions: over-all height 32 in.; over-all width, 20 in.; cabinet depth, 4½ in. Roughing-in dimensions: height 25¾ in.; width 15½ in.; depth 3¼ in.

Model "C Jr."—Two glass shelves, 16x24-in. beveled mirror.

Face dimensions: height 24 in.; width 16 in.; cabinet depth 4½ in. Roughing-in dimensions: height 19¾ in.; width 13¼ in.; depth 3¼ in.

Also Model CC with 18x26-in. mirror.

Model "B" Bathroom Cabinet**Specifications—**

Recessed type. Open compartment below.

Finish: white lacquer, or special colors upon request. 14x18-in. beveled mirror. Hinges interlocking, ball tipped.

Also Model "J" with 12x16-in. mirror.

Cabinet Ironing Board

(Approved by Good House-keeping Institute.)

The "Rocksteel" Cabinet Ironing Board is packed ready to put in place. Furnished in baked, prime coat finish so that the cabinet can be made to match the woodwork or walls of the kitchen. Can be furnished in colors to match kitchen if desired.

Roughing-in dimensions are as follows: Net width between studs, 14¼ in.; net depth, 4½ in.; net height between cross studding, 66 in.; top of lower cross studding, 15 in. from finished floor line.

Inside dimensions of cabinet: 4¾ in. net depth; 14 in. net width; 65¼ in. net height. Board, when lowered, extends 51 in. from plaster line into room.

An adjustment from right to left makes it possible to work on either side of board, in the best light.

The cabinet has a shelf at the top large enough to hold an electric iron and cord, and a hook on the door on which to hang a broom.

**"Rocksteel" Portable Wardrobe**

Made in two sections. Can be installed by combining as many sections as desired. Heavy gauge furniture steel, welded construction.

Finished in grained walnut or mahogany, or can be furnished in plain colors or prime coat, if desired.

Section WR 12 is the garment section with hat shelf above. It is equipped with garment rail. Dimensions: 36 in. wide, 20 in. deep, 6 ft. 6 in. high.

Section WR 13 is the drawer section with double shelf above. The drawers are lap type to assure their being dust-proof, and recessed in from the face of the cabinet so as to give clearance for the handles. Handles are chromium plated. Dimensions: 24 in. wide, 20 in. deep, 6 ft. 6 in. high.

Product

THE HANDI-IRONING CABINET, for installation in residences, apartments, clubs, etc.

Description

The Handi-Ironing Cabinet is a modern household convenience. The all-steel ironing board has a patented turntable attachment which permits the board to swing to right or left when in ironing position. When not in use, the board folds into the cabinet, which comes in gray, baked-on enamel that takes any finish you choose to give it. At the bottom of the cabinet is a fire-proofed compartment large enough to hold iron, cord and stand.

Qualities

The features accounting for the Handi-Ironing Cabinet's superiority are:

(1) **Economy of Space**—As it is built into the wall, the Handi-Ironing Cabinet can never be in the way. The turntable allows you to put the cabinet close to a corner or similar obstruction which would be impossible with a stationary board.

(2) **No Supports or Braces**—The Handi-Ironing Cabinet has no supports or braces to get in the way, loosen, warp or otherwise cause trouble.

(3) **Rigidity**—The Handi-Ironing Cabinet does not jiggle or buckle. It cannot warp or bend. Its life-time is equal to the house in which it is installed.

(4) **Fireproof**—Many fires start when a woman, called away from her work, leaves a hot iron standing on a wooden board. This is impossible with the all-metal Handi-Ironing Cabinet.

Approved by Good Housekeeping Institute

The Handi-Ironing Cabinet bears the Good Housekeeping Institute's Seal of Approval, which endorses the claims we make much more effectively than any statements by us.

Installation

The Handi-Ironing Cabinet can be installed between the studs in any residence or apartment. It is often desirable to build several cabinets into a house—for example, in the laundry, kitchen and certain bedrooms.

The Handi-Ironing Cabinet can be installed in old homes as well as new. The drawings shown on the next page cover all types of installation.

Specifications

It is recommended that the following paragraph be used when writing specifications:

Ironing Cabinets: A metal ironing cabinet shall be installed where indicated on drawings and shall be the "Handi-Ironing Cabinet" as manufactured by the CREO-DIPT COMPANY, INC., North Tonawanda, N. Y., and installed according to instructions supplied by the manufacturer.

Sold by Leading Lumber Dealers Everywhere

The Handi-Ironing Cabinet is sold by leading lumber dealers everywhere in the United States and Canada, most of whom have a cabinet on display. Ask the Creo-Dipt representative to arrange a demonstration showing how the cabinet works under actual ironing conditions.

Other Creo-Dipt Products

The Handi-Ironing Cabinet is sold by the manufacturers of Creo-Dipt Stained Shingles, known for twenty years among architects, home owners, dealers and builders for their color and durability.

Other Creo-Dipt products and the pages containing complete information concerning them will be found listed in the Manufacturers' Index.

Out of the Way

When not in use, the all-metal ironing board folds snugly into the metal cabinet. This comes in gray baked-on enamel which can be finished in any other color.

METHOD OF INSTALLING CABINET IN VARIOUS TYPES OF WALLS

INSTALLATION DETAILS OF HANDI-IRONING CABINET

Complete Details for All Types of Installation in Both Old and New Homes or Apartments

Compartment for Iron

In the bottom of the Handi-Ironing Cabinet is a fireproofed compartment large enough to hold iron, cord and stand.

It Pivots

A patented turntable permits the board to swing around to either right or left. Notice that the Handi-Ironing Cabinet has no supports or braces to get in the way.

STERLING TI-DI-NETTE, INC.

MANUFACTURERS AND PATENTEES

EXECUTIVE OFFICE

228 North La Salle Street, CHICAGO, ILL.

THE MODERN SPACE SAVING DINETTE

Function

Ti-Di-Nette functions as a major factor in the efficient and economical use of floor area and wall surfaces. Also in the elimination of waste space and unnecessary motion in the modern home necessitated by economic requirements.

Description

Ti-Di-Nette is a modern dinette unit utilizing foldaway dining table with seats and providing china cases, linen shelves, drawers for silver, ironing board, with optional arrangements for such auxiliaries as broom, electrical accessories, shoe shine rest, etc.

Ti-Di-Nette (of several models) is made in both the cabinet and recessed type and can be installed in all types of existing and new buildings.

The design of Ti-Di-Nette will harmonize with any architectural style or any period furniture.

Operation

To open or close the Ti-Di-Nette is a simple operation requiring but a few seconds to complete. Its simple and sturdy construction prevents anything from going wrong or "getting stuck," as its operation does not depend on adjusting hardware.

The Modern Space Saving Dinette

Advantages

Ti-Di-Nette supersedes the old-fashioned kitchen table and chairs and also provides modern dining facilities for serving a maximum of five people.

Ti-Di-Nette, installed in the kitchen of homes or apartments, eliminates the need of a breakfast room.

Ti-Di-Nette, installed in the living room of one-room apartments, provides two-room efficiency without additional cost. When installed in the dining alcove of two and three-room apartments, it provides three and four-room efficiency without additional cost.

Ti-Di-Nette is the *only space saving dinette* having foldaway table and seats used in conjunction with permanent and ample storage space accessible at all times for complete table service.

Ti-Di-Nette, installed in dining alcoves or breakfast rooms, adapts this space for additional uses. Ti-Di-Nette makes immediately available, floor area ordinarily occupied by cumbersome tables and chairs.

With Ti-Di-Nette the china and linen are always conveniently within reach and quickly out of the way after use. This feature releases corresponding space in other cabinets for storage.

DESCRIPTION OF MODELS

Model A—Recess Type—Comprises three sections. The center section contains the foldaway table, enclosed behind two swinging china cabinets. Drawers for silver are installed in the lower part of china cabinets. Below the china cabinets is a linen case, containing three shelves, enclosed with doors. Flanking the center unit are side units, each containing a foldaway seat with an 11x11x4-in. storage space below, large enough for storage of irons and other accessories. There is sufficient space behind each set to receive the ironing board which can be furnished in either seat unit depending upon where the Ti-Di-Nette will be installed. Model A is also made in the cabinet type for installation against the wall.

Model B—Recess Type—This is simply the center unit of the Regular Model A. It is the same in all respects to the larger model, except that it does not contain the foldaway seats or ironing board. Model B is also made in the cabinet type.

Model C—Cabinet Type—Comprises two sections. The upper section includes a center unit containing two swinging china cabinets and a foldaway table, and also two side units each containing five grooved shelves 14 in. long, 8½-in. deep. The lower section contains one double cupboard having shelves 27 in. long, 12 in. deep, with drawer above 27x12x4½ in. deep. On each side of the cupboard are 4 drawers—11½x10¾x4½ in. deep. Rebating the nosing and crown mould permits this model to be recessed into the wall.

The china cabinets in Models A, B and C accommodate 108 pieces of chinaware.

Model "Junior"—Recess Type—This is designed to be installed under window, and contains folding table and seats, as well as two swinging china cabinets housing 42 pieces of chinaware. Table is 28 in. wide and projects 4 ft. ½ in. from plaster line. Beneath the table is a two-door cupboard with two shelves of sufficient capacity to house silverware, toasters, etc. Can be furnished in cabinet type.

Specifications (All Models)

The fronts, folding tables and seats are birch. The shelving is white pine. The ironing board is pine. The backs of units and bottoms of drawers are $\frac{1}{8}$ -in. thick Masonite Presdwood which will not warp, shrink or swell.

Provide 63-in. wall space (width) for all models.

All shelves in china cabinets are grooved and fitted with wood guard on front edge to prevent dishes from slipping. Swinging china cabinets are hung on full length piano hinges. China cabinets are fitted with leaded French glass doors. Glass is shipped separately within the cabinet. All hardware is bronze, dull nickel finish. All drawers and doors have lipped fronts to make the units dustproof.

Foldaway tables can be furnished with Formica table tops

in attractive designs and colors at an additional charge. Architects should specify when Formica is wanted.

All models are delivered to the job "in the white" so that they can be finished at the building to harmonize with surroundings.

All models are made to recess into 4-in. stud partition with studs set flatwise back of center section. (See cut.) Can also be recessed into tile or metal partitions.

The patented construction of Ti-Di-Nette eliminates any possibility of the table or seats slipping or collapsing. The weight of table and seats when opened is supported independently of the doors.

Suggested kitchenette apartment floor plans furnished architects on request.

AGENTS IN ALL PRINCIPAL CITIES

The Windsor

For economic reasons dining rooms have been eliminated from modern apartments, but this does not relieve the necessity of providing acceptable dining conveniences to get and hold tenants.

In kitchen of the private home, in sumptuous and in inexpensive apartment, wherever modern conveniences are in demand, where beauty and good taste must be combined with utility and convenience, this new "Fain Windsor" Model has an outstanding appeal.

The accompanying illustrations show the "Windsor" recessed type open in the living room of an apartment, closed in the same living room, and same unit with a porcelain table top installed in kitchen.

Windsor Model—The Modern Dining Set

In the Living Room—Saves floor space by utilizing wall space. When open it in no way interferes with furniture, and has ample seating capacity for five people. Designed by one of America's leading furniture designers it harmonizes with the best period furniture. It fits in a 4-in. stud wall and when closed resembles a built-in book case. Made also in cabinet type to go on face of wall. Quantity production permits us to sell these sets at a price less than the cost of a good stationary mill-made breakfast set. Write for catalogue showing other models and prices.

In the Kitchen—Installed in kitchen the "Fain Fold Away" provides a better designed, more convenient and economical breakfast set.

By installing this equipment in the kitchen, cost of an alcove can be eliminated, saving several hundred dollars.

The porcelain table (29x47 in. in size) makes an excellent work table to sit at while preparing meal.

Specifications—Shipped completely assembled. Interior hardware polished nickel, exterior hardware dull brass, except when used in kitchen, where exterior hardware will be nickel. Interior parts No. 1 basswood and red gum. Exterior of No. 1 white pine. Stock finish light walnut throughout. For small cost we paint any color desired, or ship unfinished. Specify whether cabinet or recess type, wood or porcelain table top.

ATLAS METAL WORKS

Manufacturers of Steel Telephone Wall Cabinets

DALLAS, TEX.

The Increasing Use of Telephone Niches

Telephone niches have become popular in recent years. New buildings are few that do not include built-in niches of some description. They provide an "out of the way" place and, at the same time, an attractive receptacle for the telephone instrument and its accessories.

Considerable time and much thought has been expended in the past to fit the telephone into the decorative scheme—shades, screens, etc.—but these have made way for the wall niche which offers greater convenience along with a touch of beauty and distinction.

Atlas Steel Telephone Wall Cabinet

The design of the Atlas Cabinet is the result of much experimentation and conforms with the requirements of the telephone companies.

Sturdily constructed of fine steel for great strength and long life, it is small and compact with no waste space and is easily installed. It may be finished to harmonize with surrounding decorations.

Details of Construction

Material—No. 22 gauge steel—black or "rust-resisting."

Size—Inset is 12½ in. wide, 28½ in. high, 4 in. deep.

Bell Button—A bell button is provided in the right hand corner of the instrument shelf for ringing a remote bell for calling persons from other parts of the house to the telephone.

Bell Box Housing—Conveniently located in the lower portion of the cabinet behind a metal panel. It is proportioned to permit easy installation or repair of the bell box and accessories. The panel is readily removed and the housing is so designed that the ringing of the bell is not muffled.

Portable Wall Desk—The outside cover of the cabinet lowers as shown in the accompanying illustration and acts as a desk for the convenient use of the telephone book, making of memoranda, etc.

When not in use, the telephone book is housed between this outside cover and the panel over the bell box housing, falling into place for immediate use when the outside cover, or desk, is lowered into position.

Pilot Light—A shaded light is installed in the upper right-hand corner of the rear panel. It is indispensable when using the telephone book or dialing on the handset in the dark. The shade recedes into the panel extinguishing the light when not desired.

Detail Plan of Installation

Clearance must be cut or constructed 13 in. wide, 29 in. high, and depth of wall not less than 5 in. including lath and plaster so as to receive the cabinet which is 4 in. deep from the edge of the plaster line. These dimensions allow space for rough plaster in back of cabinet

Open Cabinet with Interior Panel Removed to Show Convenient Location of Bell Box Housing

Note rear view of pilot light and shade in upper corner of panel

With Portable Wall Desk Lowered

The lamp shield is extended to deflect light on the telephone book

The Closed Cabinet

Modern and clean-cut in appearance and may be finished to harmonize with surrounding decorations

GRIFFIN MANUFACTURING CO., INC.

Manufacturers of Recessed and Surfaced Steel Cabinets for Shoe
Cleaning and Storage of Polishing Supplies

67-69 Murray Street
NEW YORK, N. Y.

Product

GRIFFINET SHOE "CLEANING" CABINETS for installation in residences, apartments, institutions, dormitories, clubs, offices, etc.

Griffin Established Since 1890

Griffinet Cabinets are a product of GRIFFIN MANUFACTURING CO., INC., specialists since 1890 in manufacturing leather dressings and shoe polishing equipment. Griffin shoe polishes are the foremost leather dressings for saving "new shoe complexions." The Griffin Company maintains in these cabinets the same high quality standards of material, design and construction upon which their reputation has been built.

Griffinet Shoe "Make-up" Cabinet

The Griffinet is a modern, compact cabinet fixture for bathroom or other household use. It is a combination shelved receptacle for storing bottles, brushes, cloths, etc., and a firm shoe polishing footrest the proper height from floor. Griffinet Cabinets provide complete, concealed equipment in a convenient place for daily shoe grooming. They are simple and comfortable to use, conserve time of user and eliminate the annoyances of shoe care. They are the last word in cleanliness—clean to use and easy to keep clean. They operate quickly, easily, silently, and are built to last as long as the house.

Griffin patents cover the principles of construction.

Made in Recessed and Surfaced Types—Recessed in the wall or attached to the wall surface, Griffinet Cabinets require no special construction, retiling or extra space for installation. They can be inset in the wall or screwed on to the wall with a minimum of labor. They are made of heavy furniture steel with durable white enamel finish. Both recessed and surfaced type cabinets have the same construction features and are built of identically the same high quality materials.

Features of Construction—(1) Made of heavy 14 gauge furniture steel. (2) Super-durable, baked-on white enamel finish. (3) Special, strongly built hinges. (4) Positive friction catches insure tight-fitting, non-rattling door. (5) Shelves welded in place—non-adjustable. (6) Corners are rounded and spot-welded. (7) Fire, moisture, and vermin proof. (8) Ample screwholes for fastening. (9) Easily cleaned, will not crack, chip, stain, or warp from moisture or heat.

Griffin Footrests

The patented footrest, illustrated on following page, is of cast iron, strongly anchored, properly moulded to fit any shoe. The heavy wires on both sides of footrest hold polishing cloth firmly but lightly on the shoe, preventing it from shifting and eliminating back strain. Cloth goes over the shoe, then under the wire and upward on the outside. Thus the up and down motion effected by the bootblacks is given.

An Attractive, Modern Fixture for Household, Bathroom or Cloakroom

Operates Quickly and Easily with Friction Catches and Is Simple to Use

Opens Out Into a Firm, Substantial Footrest, the Proper Height from Floor

Follow the Trend

Every year sees new improvements for home and apartment that save time and work or add in some way to the conveniences of modern living. Griffinet Cabinets are in keeping with the trend of the times—in their construction, appearance, simplicity and usefulness.

A Rental and Sales Inducement

An increasing number of tenants and buyers of homes demand this extra convenience as insistently as they do electric refrigeration and incinerators. Wise builders are including Griffinets in their specifications. Figured from their angle, Griffinets are sure-fire sales and rental inducements and possess value far beyond their low installation cost.

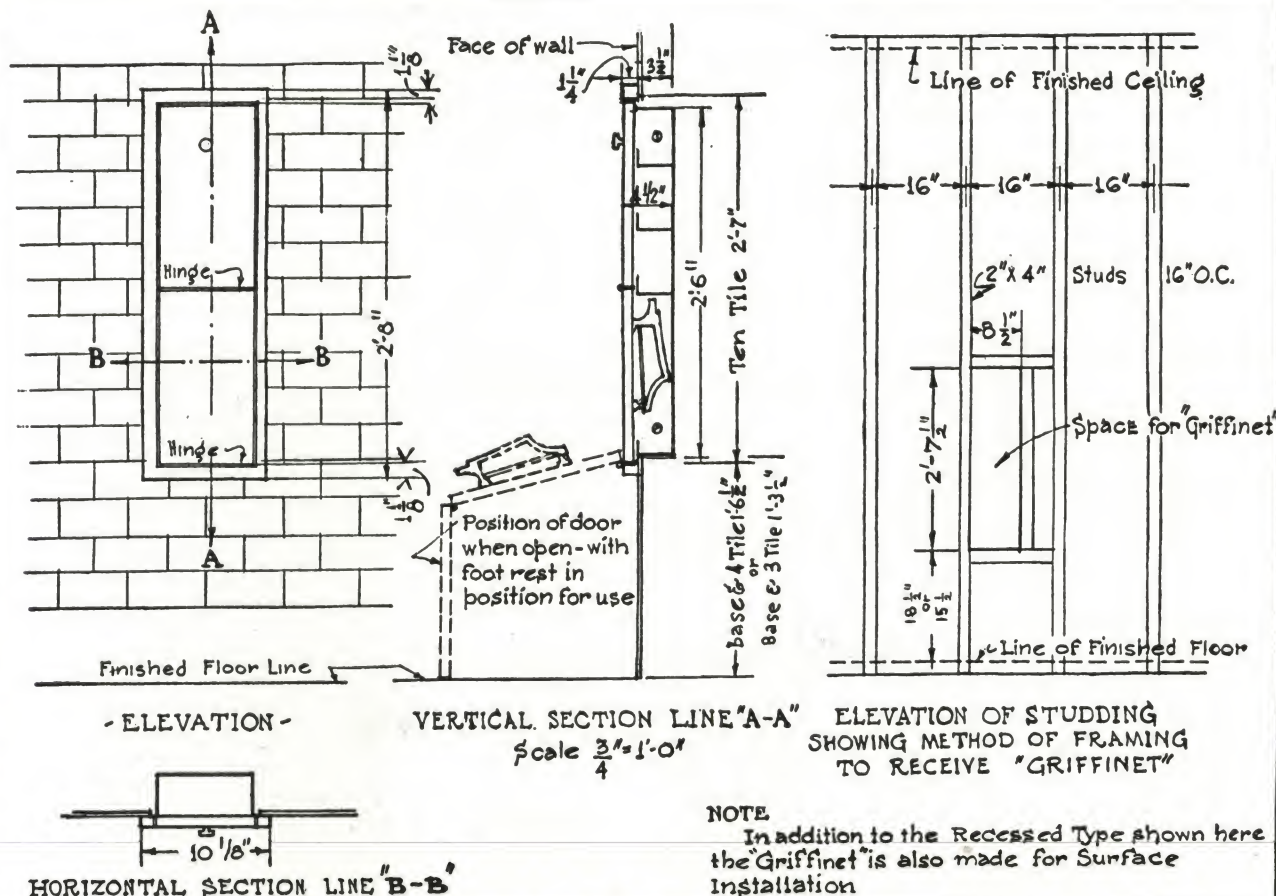

Colors

The Griffinet Cabinets are only made in white enamel finish. However, they will be finished in any color selected. There is a nominal charge for this service and a little delay in shipment.

Griffinet Cabinets on Display

Griffinet Cabinets displayed at the Architects Samples Corporation, 101 Park Avenue, New York, N. Y., and with dealers throughout the country. Write for further specifications or data whether requirements are one or one thousand.

Architects and construction engineers who include Griffinet Cabinets in their specifications may do so with fullest assurance of dependability and merit of product. The name Griffin is sponsor only for the best.

INSTALLATION DETAILS FOR "GRIFFINET" SHOE MAKE UP CABINET

CHURCHILL FOLDING DOOR TELEPHONE BOOTHS

MANUFACTURED BY
CHURCHILL CABINET COMPANY
2119 Churchill Street, CHICAGO, ILL.

DISTRIBUTED NATIONALLY BY
J. H. BUNNELL & COMPANY, INC.
215 Fulton Street, NEW YORK, N. Y.

Churchill Folding Door Telephone Booths

The Standard No. 1 Type Folding Door Booths are designed for group installations, being built in units having unfinished sides. Each booth is a complete unit in itself, a self-contained construction that assures rigidity and perfect operation. Finished end panels can be placed at exposed ends of the group of compartments with hardwood separators placed between adjacent units. Finished hardwood backs are used instead of soft wood backs where rear of booth is exposed. The use of separators is recommended where the ends and back of compartment group are not exposed.

Folding Door Construction

Churchill Booths are particularly desirable where space is limited, as the movement of the door takes but 3 in. beyond the face of the booth. No interference with the doors of adjacent booths. The folding door remains in any position, being both opened and closed by a slight pull. It folds back out of the way and within the booth itself.

The folding door with its ingenious middle hinge fastened for the full length of the door assures alignment and ease of operation. Sagging, the greatest maintenance trouble, has been eliminated. Climatic conditions do not affect the operation of this type of folding door. The upkeep cost is eliminated.

General Features

The interior is finished in wood panel or lined with steel as desired. Special woods furnished on request. The booth floors are covered with linoleum protected at the threshold with a safety tread. Each booth is fur-

nished with an elbow rest shelf. When specified, a seat made of the same material as the booth can be furnished. A space of $4\frac{1}{2}$ in. between ceiling and roof of booth is furnished for electric light relay or door switch equipment wiring, which can be supplied at a slight extra charge.

Special Features

Special Booths—Special booths for particular jobs or specifications of the architect can be supplied and estimates will be gladly furnished.

Special Finishes—Any color sample furnished will be matched with extreme accuracy.

Special Pulls—Pulls to match existing hardware will be supplied when requested.

U-hinge—Unless otherwise requested this hinge (pictured below) is supplied in black enamel finish.

V-hinge—Also used on folding doors but supplied when specified. Finish oxidized.

Quotations—On request.

General Construction Details

Dimensions for standard booths: height $88\frac{1}{4}$ in.; width without end panels or separators attached, 29 in.; thickness of end panels or separators, $\frac{7}{8}$ in.; height of door only, 76 in.; height of seat from floor, 22 in.; size of seat, 12×18 in.; depth of booth, $30\frac{1}{2}$ in.; width of shelf, 6 in. at front and 9 in. at rear; height of floor 4 in., height of head rail $8\frac{1}{4}$ in.

Material: oak, mahogany, birch or walnut. Can be had in the white, that is, without finish, if desired. All booths are supplied glazed with two lights of $\frac{1}{4}$ -in. polished plate glass in the doors.

CIRCLE A PRODUCTS CORPORATION

Manufacturers of School Wardrobes

654 South 25th Street, NEWCASTLE, IND.

NEW YORK, N. Y., Farmers' Loan and Trust Building, 475 Fifth Avenue
BRANCH OFFICES IN PRINCIPAL CITIES

Product

CIRCLE A PAIR OPERATION and GROUP OPERATION SCHOOL WARDROBES.

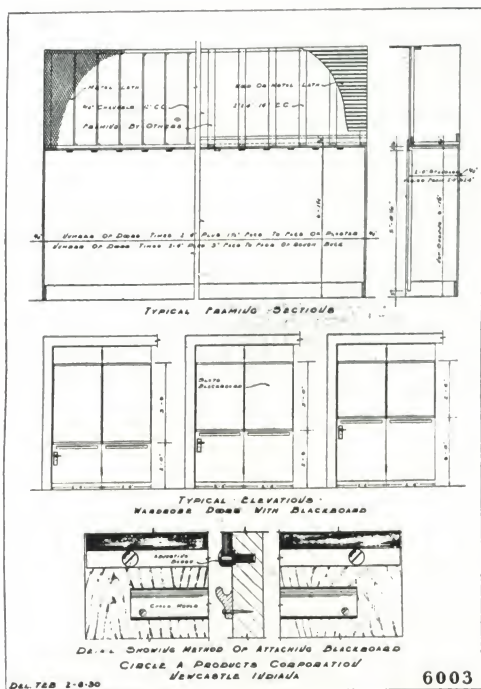

For Sectional, Folding, Rolling Partitions and Kitchen Units, see Manufacturers' Index.

Circle A School Wardrobes

Circle A has designed and built two styles of school wardrobes to meet every possible school wardrobe need—the Pair Operated and the Group Operated.

Pair Operated—Circle A Pair Operated doors have each pair as a separate unit—opened and closed individually. Locking equipment is optional.

Group Operated—Circle A Group Operated doors are connected to one main control, so that all doors open or close together. A locking device holds all doors closed. Movement of the first door releases and opens all Group Operated doors at the same time.

General Construction—Ventilation is provided by carrying exhaust circulation through the wardrobe. Circle A Wardrobes are especially designed for this. Simplicity and sturdiness are two of the outstanding features of Circle A Wardrobes. Doors supported in pairs require less hardware. The drop forged, ball bearing arms on which the doors swing are neat and rugged, and permit finger-tip operation. No chance for wobble or rattles. Blackboards fold together so that students cannot brush against them.

You take no risk when Circle A Wardrobes are specified. They are furnished and installed complete, with a guarantee of satisfactory service. The doors, representing the finest in cabinet work can be had in designs and materials to harmonize with the prevailing details in the building. Blackboard or cork surfaces are available. Hat and coat racks are provided.

Installation—Circle A Wardrobes are installed by Circle A installation engineers, and perfect operation is guaranteed.

Catalogue—Write for file data giving complete plans and information on these efficiently designed and carefully built wardrobes.

W. L. EVANS

Manufacturer of Vanishing Door Equipment

Main, South and Mill Streets
WASHINGTON, IND.

CANADA: WINDSOR, ONTARIO

EVANS VANISHING DOOR WARDROBE, CLASS B-B, WITH CLASS W HINGES

Specifications

Doors—Size of all doors 1 ft. 11 $\frac{1}{8}$ in. by 5 ft. 7 $\frac{1}{4}$ in. by 1 $\frac{3}{8}$ in., with one edge slightly rounded to permit doors to open without rubbing. Doors are flush type made "Evans Process," which consists of a series of alternate ribs and air spaces forming the core, covered with laminated cross bands and veneers. This makes a lightweight door which will not shrink nor swell in length or breadth. Doors sold in the white without filling or staining. Doors set a minimum of 4 $\frac{1}{8}$ in. above floor and are interchangeable.

Fillet—A wood fillet 1 $\frac{3}{8}$ in. thick and 4 $\frac{1}{8}$ in. wide is required above the doors. This must be stop rabbetted $\frac{7}{8}$ x 1 $\frac{5}{8}$ in. along the lower inside edge to allow the hinges to operate.

Blackboards—May be either "Sterling Lifelong" or genuine slate, but unless otherwise specified "Sterling Lifelong" is provided. Blackboards are 42 in. high and full width of doors. Brass mould is furnished for securing the blackboards, at top and bottom edges, to the doors. Chalk trough is also provided.

Hardware—The hinges are Evans "Vanishing Door" Hinge Class W, made entirely of steel and machined to accuracy. They will set the doors from a minimum of 4 $\frac{1}{8}$ in. above the floor up to any height desired. The hinges for a single door weigh 6 lbs. Safe load is 300 lbs. The hinges are held, top and bottom, with expansion bolts and screws. They are heavily copper plated and finished a black gunmetal. Metal door stops are also provided.

Interior—Consists of racks and garment hangers. Racks are composed of metal brackets with wood rods and a metal hanger rod. Garment hangers are the famous "Goodform" wood hangers with reinforcing bar. Brackets and rods finished in black lacquer; hangers finished in natural wood.

Recess—The lintel must be strong enough to prevent any sagging that would cramp the doors. Length of recess should be in even feet and preferably a multiple of four, as 4 ft., 8 ft., 12 ft., etc. Minimum depth 2 ft. 2 in. Height from floor to plaster lintel, 6 ft. 3 $\frac{1}{2}$ in. These are finished measurements. Ends, backs and ceilings plastered. All outside edges around recess to be protected with metal corner bead before plastering.

Ventilation—This is taken from the floor line into the wardrobe under the door and out through the vent stack which can be connected to the wardrobe at either the ceiling, end, or back—whichever will best meet the requirements.

Extras—Umbrella racks, shoe receptacles, and interior of 5-shelf bookcase in place of rack and hangers, can be furnished when specified.

Catalog "K"

A.I.A. file size, with specifications and price list. Catalog "K" fully describes, illustrates and details many types of "Vanishing Door" wardrobes. Sent promptly on request.

LIKLY-ROCKETT INC.

Manufacturers of Portable and Built-in Air-tight Wardrobes

1365 Euclid Avenue
CLEVELAND, OHIO

PITTSBURGH DISTRICT: DAULER-CLOSE FURNITURE Co., 636 Smithfield Street, PITTSBURGH, PA.
WASHINGTON DISTRICT: DULIN & MARTIN, Connecticut Avenue and L Street, WASHINGTON, D. C.

A Modern Way to Solve Your Clients' Clothing Storage Problem

Proper protection for clothing and furs is a matter of great importance, and in modern homes sealed rooms are being provided for this purpose. The Likly Air-tight Wardrobes are especially desirable, being so designed that fine dust or smoke cannot penetrate them, and they are mothproof. They are made in two styles, portable and built-in, both cedar lined.

In beautiful homes costing \$10,000 and upward, provision should be made in the plans to include Likly Air-tight Wardrobes. Here they may be arranged to give clothing and furs the same degree of protection that electric refrigeration gives to food.

The Likly Air-tight Wardrobe is a scientific improvement over the old-time clothes closet and the tightly sealed door assures safety for the contents. By means of a door closing on a patented tire, the wardrobe is sealed to keep out air, dust, dampness and moths.

The architect, by skillful handling of the plan, can give this needed protection in many unthought of places, from reception hall to third floor, at a surprisingly low figure.

Contractors, in the erection and sale of new homes, will find the installation of a Likly Air-tight dustproof, mothproof, cedar-lined wardrobe often a deciding factor in their favor.

In new homes, at least three closets in the upstairs bedrooms should be cedar-sealed so that your clients can enjoy the protection Likly-Air-tight Wardrobes afford. In home building, the studding can be properly spaced so that the $\frac{1}{8}$ -in. cedar panels can be quickly installed 7 ft. high. This eliminates the necessity of having the closet plastered, thus rendering a saving to the owner.

Experience

LIKLY-ROCKETT INC. has been manufacturing this type of air-tight wardrobe for over twenty-five years, and several thousand are in use in Cleveland and vicinity.

Uses

They are used principally in bedrooms, connecting halls, reception halls, storage rooms, summer homes; in the garage for uniforms; in apartments of all types; in churches for vestments; indispensable in business offices, clubs, private yachts, polo and golf clubs.

Modern Design—Model M

Construction Features

They are designed to harmonize with the present style in bedroom furniture. The Modern type illustrated is plain and simple, showing the beautiful markings in genuine mahogany. The Colonial model is made with a wood inlay of distinctive design with brown, tan and white colors in the pattern, making a decidedly beautiful effect. The Sheraton model is raised and tooled to harmonize with furniture of this period.

Finish—All standard models are finished in a beautiful brown mahogany. Any finish in the following woods is available to order: birch, oak, maple, birds-eye maple, walnut or circassian walnut. Send working sample which we will match exactly.

Color—The Likly Air-tight Wardrobe can be had in any color of enamel or duco. Furnish name, number and color of manufacturer's product and send working sample.

Portability—As the Likly Air-tight Wardrobe weighs but 150 lb. and is mounted on bakelite gliders, it may be easily moved, even when packed to capacity.

Capacity—24 or 36 especially designed thin model hangers permit the hanging, in either size wardrobe, of a great number of dresses and coats.

Sealing—The door seals on a rubber tire, absolutely keeping air out and preventing fine dust and moths from getting in.

Hardware—Standard models are furnished with solid brass hardware in a monumental bronze finish. The lock is newly designed which needs no key—the Sesamee combination lock.

Material—The wardrobe exterior is made of 5-ply mahogany veneer with a cedar lining and chestnut core $\frac{1}{8}$ in. thick. This is carefully machined and joined to seal the wardrobe air-tight. Blue prints on application.

Sizes—The Likly Air-tight Wardrobe is made in two standard sizes. 36 in. long, 24 in. wide and 72 in. high, which is Style 36M. Also 45 in. long, 24 in. wide and 72 in. high, Style 45M. These sizes are made in all three models.

Send plans for estimate. Where a number are to be installed our union erection superintendent will be glad to go to any city to supervise and complete the job. This service is charged for at cost.

Information

Architects may obtain prices and other information by writing direct to LIKLY-ROCKETT INC., 1365 Euclid Avenue, Cleveland, Ohio.

Miller School Wardrobe

The Miller School Wardrobe is a series of wooden doors in any kind of wood finish, either with or without slate blackboard or cork carpet, made in standard width of door, each door 30 $\frac{1}{8}$ in. wide, and with varying depth, 21 $\frac{1}{2}$ in. if no shelf is wanted or if a shelf and compartments are used the depth of the shelf or compartment plus 18 $\frac{1}{2}$ in. The correct height to leave the opening from the floor line to underneath side of rough buck is 6 ft. 2 in.

Doors swing open as shown giving access to the wardrobe from both sides. Legs are adjustable in height and a 4 to 5-in. opening underneath the doors affords proper ventilation at all times. Hooks are placed on shelves, walls and back of doors.

Miller Wardrobes are neat in appearance, do not take up needed wall space, and harmonize with the school atmosphere.

Types of Miller School Wardrobe

The Miller School Wardrobe may be singly controlled by teacher or by each individual, as desired.

Key locks for wardrobes are furnished at extra cost. Master key on first door controls all other doors on either of the following types:

Standard Type—Opening the first door on the left-hand side opens all doors; or any door may be opened individually.

"K" Type—Opening first door on left-hand side opens all doors; but no door may be opened individually.

FACTORY: ADDISON, N. Y.

Product

FAIRHURST SCHOOL WARDROBES.

For Fairhurst Folding Partitions, see Manufacturers' Index.

Fairhurst School Wardrobes

After designing, improving and perfecting school wardrobes over a period of 30 years, John T. Fairhurst offers these wardrobes not as luxuries, but as economic necessities for modern schools.

Mr. Fairhurst is giving his personal attention to all wardrobe and partition jobs.

Due to unique interior design, 44 pupils can be accommodated in a space 2 ft. deep by 8 ft. 8 in. wide, thereby reducing the necessary cubage of the building. Wardrobes of other dimensions are furnished when required.

Three Types of Operating Hardware—Any of three different types of Operating Hardware may be applied to the doors of Fairhurst School Wardrobes. The individual requirements of each school determine which of the following types to use:

Single Operating—Each door is opened and closed independently of the other.

Dual Operating—It is necessary to handle only the right-hand door of each pair of doors; the left-hand door moves automatically when the right-hand door is moved.

Multiple Operating—The entire battery of doors may be opened or closed by handling *only one door*, the *right or left-hand door of any pair*.

Advantages

The aisles and interiors of the wardrobes are free from obstruction at all times whether the doors are open or closed.

Continuous slate blackboard (optional—may be mounted on wardrobe doors) has close joints; board is protected when doors are open.

In the open position the doors are entirely out of the way at the ends of each compartment.

The interior arrangement of the wardrobe remains unchanged whether the doors are open or closed.

Three Compartments, Dual Operating, Fairhurst School Wardrobe, Hewlett School, Hewlett, N. Y.

The two end compartments, open, show how doors pivot completely out of the way

The doors pivot—there are no rollers or wheels, no track on the floor. The operation is simple, smooth and quiet.

Any of three types of control may be applied to any wardrobe installation—single, dual or multiple control—thus meeting the requirements of any school board or architect.

The multiple operating hardware is of such ingenious design that 12 or 14 doors (if you should ever want that many) can be operated at one time with practically no more effort than it takes to move a pair of doors. Anyone who is "mechanically minded" will be intrigued at once by the simple and positive action of this rugged, troubleproof hardware.

The entire wardrobe, if this is desired, may be locked by one lock conveniently located at one end of the wardrobe.

Construction Details

All metal parts which are subjected to strain and constant use are designed to stand up under much rougher treatment than could possibly be imposed upon them. All wardrobes are 2 ft. deep; the widths may vary. No track on the floor. Blackboards and chalk rails with close fitting joints are furnished when required, providing a smooth, even writing surface when the doors are closed.

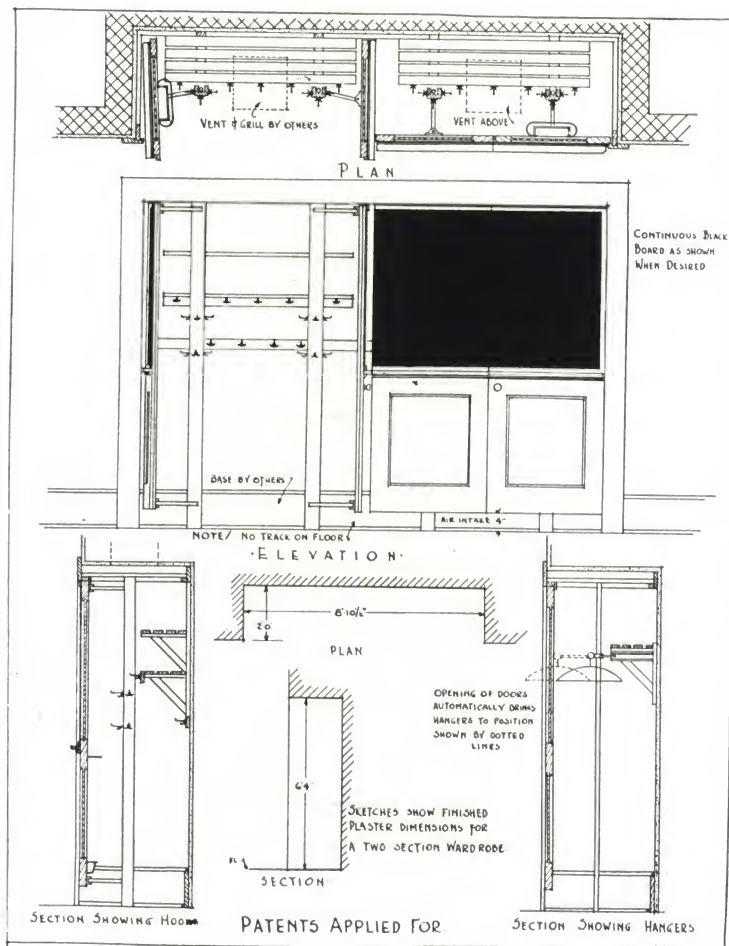

Specifications

Where indicated on plans, furnish and install Fairhurst single, dual or multiple operating type disappearing door wardrobes.

Wardrobes to be furnished complete with all hooks, shelves, etc. No track is to be used on floor.

Doors to be standard flush or panel design 1 3/4 in. thick, veneered on built-up cores (and equipped with continuous slate blackboard and chalk rails).

All hardware to be standard black finish, except hooks, latches or pulls, which are to be polished bronze plate.

VOLUNTEER 4975

BRANCH OFFICE: MUNICH, GERMANY, HALLMAIERSTRASSE, 8

Honeycomb (Hexagonal) Bottle Racks

Sheet metal, hexagonal shelving, made to measure or furnished from stock in standard sizes.

Shipped knocked down (nested) in small, closed boxes; ready for re-assembling at the rate of over one thousand cells a day by a novice.

Advantages

Bottles are securely held within individual cells, within plain sight and convenient reach.

Corks are kept wet and tight, thus retaining gas-pressure and quality of contents.

Save 40% of wall space. More economical than wooden shelving.

Service

Over ten years' faultless record for local, long dis-

tance and export service attested to by architects from coast to coast.

Illustrated pamphlets, plans, estimates and practical suggestions for stockrooms and wine cellars free of charge.

Your inquiries will receive our prompt attention.

Price

\$20.00, approximately, per 100 cells, f. o. b. New York City; weight, packed, 40 lbs.

1413-1425 Vine Street
PHILADELPHIA, PA.**Products**

"AUTOPOLAR" ELECTRO-MECHANICALLY REFRIGERATED SODA FOUNTAINS.

Also Cold Lunch Equipment, Steam Tables, Carbonators.

Electro-Mechanically Refrigerated Soda Fountains

Green Soda Fountains are 100% electrically refrigerated and represent the highest attainment in modern soda fountain construction. They assure long continued service, economical operation and greatest convenience.

Built by an organization with fifty-seven years' experience in quality soda fountain production, they enjoy a remarkable freedom from repair bills and abnormal depreciation.

Features

The "Autopolar" Fountain is of all-stone and metal construction throughout and is made to accommodate any standard system of mechanical refrigeration (your choice).

"Super-Cyclone" soda water cooling system, exclusive in the "Autopolar," designed for handling a

Autopolar

TRADE-MARK

**Cost**

The cost of "Autopolar" Fountains is as low as careful management, coupled with modern methods can keep them, without impairing the high quality.

Guarantee

"Autopolar" and all Green Fountains are built by skilled mechanics and are guaranteed against defects in material and workmanship.

Special Service to Architects

A department of engineers is maintained to operate in conjunction with architects in planning soda fountain equipment. Be free to ask us for ideas and plans without obligation.

Qualified representatives always on quick call.

Catalogues and descriptive matter mailed on request.

General Information

The Green illustrated catalogue contains information on fountains of all lengths and layouts. The several plans shown on the following page give a general idea of our ability in this line.

"Super-Cyclone" Cooler
(Patent pending)

Green "Autopolar" Fountain Built for Stephen F. Whitman & Sons, Inc., Philadelphia, Pa.

large business. This system carries at all times a cold storage reserve sufficient to dispense 110 glasses of beverage.

Cold rolled copper linings, 1½ lb. per sq. ft., reinforced. Patented automatic self-closing soda water draft arms. Milk pumps, rinsing water vats, automatic washers.

Nonpareil odorless cork insulation in layers with Ru-ber-oid. Patented silver-plated syrup pumps.

Inquiries Receive Prompt Attention

Special attention is directed to the prompt and efficient handling by the Green organization of all inquiries for plans and information relative to soda fountain equipment. If drawings or blue prints of floor plans are sent with requests for proposals, the data is immediately put into hands of draftsmen and no time is lost in supplying specifications.

Products

SODA FOUNTAINS and SODA FOUNTAIN EQUIPMENT.

COMPLETE LUNCHEONETTE INSTALLATIONS, including Kitchen Equipment and Luncheonette Equipment.

Also Soda Water Carbonators.

The Company

The first soda fountain built by THE LIQUID CARBONIC CORPORATION, more than thirty years ago, embodied a number of original features that immediately won for it a high place in the esteem of users of this type of equipment. Throughout its history this organization has maintained a policy of pioneering research in its line, and of incorporating the

results of its thorough planning in constantly improving equipment, the details of which are described below.

Representatives of THE LIQUID CARBONIC CORPORATION are experts in luncheonette and soda fountain equipment, and are always ready to assist architects in planning, specifying and selecting the correct units of equipment.

Guarantee

All luncheonette and soda fountain equipment manufactured by THE LIQUID CARBONIC CORPORATION is unconditionally guaranteed against defects of workmanship, and is backed by one of the largest manufacturers in the world of this type of equipment.

Luncheonette Equipment

Experience of Engineering Staff

When the luncheonette idea first appeared the engineering staff of THE LIQUID CARBONIC CORPORATION were prepared to plan the necessary equipment because of more than thirty years of experience in planning soda fountain equipment. The specialized experience in luncheonette planning they have gained since that time in laying out installations for such well-known chains as Liggett, Interstate, Kresge, McCrory, Metropolitan, and many others makes them unusually well equipped to plan luncheonette layouts to meet all requirements with maximum efficiency.

Service Rendered by Representatives

The representatives of THE LIQUID CARBONIC CORPORATION, with headquarters in most of the populous centers of the country, are in close touch with the luncheonette business, and know its needs. Each representative is equipped to render the last word in service in assisting architects and owners to plan luncheonette equipment.

Production Facilities

The facilities of THE LIQUID CARBONIC CORPORATION are unsurpassed for large scale production of luncheonette equipment, being among the largest manufacturers of this equipment in the world. This results in economy of manufacture and speed in getting the job done. As an ex-

ample, a job recently completed for the Famous-Barr Department Store had over 600 ft. of counter space. Few other manufacturers could attempt to handle a job of this size.

Types of Luncheonette Equipment

The most successful principles of the numerous installations that have been planned by this organization have been combined in a series of stock units that are offered at attractive prices for equipment of this high character.

By way of demonstrating the complete range of luncheonette equipment offered, a large and an average sized installation are shown. The first illustration (Fig. 1) shows the luncheonette installation in the Famous-Barr Department Store in St. Louis, Mo. It contains over 600 ft. of counter space, sufficient for over 300 stools, and is thoroughly equipped for service on this scale. Fig. 3 shows a typical 24 ft. layout made up entirely of stock units, with the exception of the workboards.

Mechanicold Cooler Box—The Mechanicold cooler box shown (A) is 7 ft. 6 in. long, with a capacity of 30 gal. of bulk ice cream and 10 gal. of brick or package cream. It is equipped with a milk pump, crushed fruit jars, syrup pumps and draft arms (two soda and one water), all conveniently arranged for speedy service. Also made in stock sizes from 6 ft. 6 in. to 9 ft. 6 in.

Fig. 1. Famous-Barr Department Store Luncheonette Installation, St. Louis, Mo.

Mechanically Refrigerated Salad and Toaster Cabinet—The mechanically refrigerated salad and toaster cabinet (B) is 5 ft. 2¼ in. long. It contains ten deep inserts and one shallow pan, all made of porcelain enamelware. Also includes crumb drawer, plate rack, cutting board and shield. Any desired temperature can be maintained in the cooling compartment. The toaster section of this cabinet contains two drawers. The lower drawer is for loaf bread storage. Sliced bread is kept in the top tilting drawer which is provided with a partition.

Workboard—The workboard (C) is 4 ft. 6 in. long. It is of metal construction with built-in dishwasher. There are two shelves for dish and silver trays. Also includes extra basin, running water, dipper well and refuse chute. Also made in stock size 6 ft. long with four shelves.

Fig. 2. (E) Steam Table

Steam Table—The steam table (E) is set back against the wall. It is 5 ft. 10 in. long. Has six 1-qt. vegetable pots and two large meat pans with a metal hood and space for coffee urn. Lower part built with a warming oven.

Urn Stands and Pastry Cases—In addition to the units that comprise this layout, urn stands and pastry cases in stock units are also available.

The pastry cases are of plate glass and nickel silver construction.

Complete Layout—With these stock units as a basis an outfit to meet any average sized requirement can be assembled at a very moderate cost. No job is too large for THE LIQUID CARBONIC CORPORATION'S facilities and none too small to merit their most thorough attention to details.

Fig. 3. A Typical 24-ft. Luncheonette Installation

(B) Mechanically Refrigerated Salad Cabinet and Toaster Section

(C) Workboard with built-in dishwasher

Soda Fountain Equipment

The mature experience of more than thirty years is built into "Liquid" Soda fountains in the form of hidden value details of which the following are typical:

Stub Brine Tank (Fig. 4)—Makes possible the maintenance of a uniform temperature throughout the entire ice cream can, top to bottom. Result, ice cream of uniform consistency, no shrinkage.

Fig. 4. Stub Brine Tank

Refrigerated Syrup Enclosure (Fig. 5)—By means of mechanical refrigeration an ice formation is maintained at the bottom of the syrup enclosure in which the syrup jars set. This insures cold, fresh syrup and prevents spoilage. Pure corkboard surrounds the entire enclosure and strips of non-conducting material break the metal contact, insuring complete insulation.

"Alvey" Syrup Pump (Fig. 6)—One furnished with each fountain. Patented construction makes it throw a set amount of syrup. Standard double support pumps, and a

special heavy duty pump for chocolate syrup, etc., are also supplied with each cooler box. "Bakelite" insulating tops add a pleasing note of color and prevent loss of refrigeration.

Insulated Draft Arms (Fig. 7)—Made of pure nickel silver, silver plated. Pure corkboard is packed around the block tin delivery tube to conserve refrigeration. Represent a distinct departure in artistic design.

Non-conducting Rings and Insulated Cover (Fig. 8)—The rings around the sleeves of the ice cream compartment are made of non-conducting material. Perfect fit effectively breaks metal contact, reducing the escape of refrigeration. Covers are of same material, and in addition have 1¼-in. cork insulation. The pitch of the top prevents water from running into the cans. Ring and cover effectively seal cans against air circulation.

Marble Cooler Boxes (Fig. 9)—Constructed of marble, will not warp, twist, corrode, or deteriorate in any way. Completely insulated with pure cork.

Fig. 5. Refrigerated Syrup Enclosure

Fig. 6. Positive Measuring "Alvey" Syrup Pump

"SUNNE"**Products**

STOOLS, round, square, fluted, hexagonal or triangular, in steel, iron or bronze.

SEATS, wood, fibre, metal, upholstered.

TABLES, wood, fibre, metal.

TABLE and COUNTER TOPS, rubber, linoleum or linotile.

Colors

Rubber Colors—Refer to Manufacturers' Index for Wright Rubber Products Co. Color Chart.

Linoleum Colors—Gray, green, brown, black, orange and red, also refer to Manufacturers' Index for Armstrong Cork Company and see their color chart.

Features of Construction

The following cross-sectional views of Marks moulded rubber, linoleum, or linotile table and counter tops show the edge of the same material, wood or nickel silver, the latter being recommended for constant wear.

Cross Section of Waxed and Moulded Rubber Table and Counter Top

Cross Section of Table Top with Wooden Edge

Cross Section of Table Top with Nickel Silver Edge

Stool Construction and Installation

Cross section shows our 12 1/2 C all-steel, non-wabbling or rocking machined tripod with automatic seat return for keeping stool seat and back in perfect alignment when unoccupied.

This automatic seat-return works on a gravity principle, swings up an incline and the weight of the seat swings it back in place. Seat can make a complete revolution. No springs or clamp to break. Foolproof and as simple as an old fashioned swinging gate.

The cross section of the ball bearing steel tripod shows its construction. All parts of stool and tripod are machined and fitted with ball bearings that eliminate wear and friction.

The 12 1/2 C steel tripod can also be equipped with ball bearings.

Fastening Stools to Floor—For wood floors, we drill four screw-holes in base and use wood screws.

For setting on tile or concrete, where it is possible, use a bolt through

a plate, up from the underside of floor and set as instructed below. An expansion bolt may be used.

Drill a hole after floor is laid, or arrange when floor is being laid for a hole, 2 in. in diameter, from 2 to 3 in. deep with laterals as shown in cross section. Heat and set in the hole a 1/2 x 4-in. square head machine bolt. Fill the hole to level of floor with molten sulphur, thread nut in the bolt and place lock washer on top of the bolt.

Screw the stool onto the bolt through cross bar in bottom of stool. The lock washer permits from one to three turns of stool after it is fairly tight to set the automatic seat return. The low level of lug in collar of stool must face the counter and the way you want the seat to face when not in use.

Set stools with backs on 26-in. centers and 11 in. from edge of counter to center of seat.

Kitchen and Bake Shop Equipment

4410 Marburg Avenue, OAKLEY, CINCINNATI, OHIO

Products

CENTURY BAKE SHOP OUTFITS and CENTURY GIANT MIXERS.

Also Flour Blenders, Flour Bins, Elevator and Sifters, Flour Hoppers, Tempering Tanks, Standard Speed Dough Mixers, High Speed Dough Mixers, Combination Divider and Sealers, Two-pocket Dividers, Rounders, Automatic Proofers, Moulders, Cake or Kitchen Machines and Cookie Droppers.

Standard Equipment—All Giant Mixers, except Model "B," are equipped with two bowls, two wire whips, two aluminum beaters and one dough hook. The 15-qt. mixer with one bowl and two beaters.

Detail Information and Service

Complete details, and service of trained field representatives sent on request.

Century Bake Shop Outfits

Consist of flour storage bin, elevator and sifter, automatic flour weighing hopper, automatic water tempering and weighing tank, standard dough mixer. Cake or kitchen machine optional.

Individual motor drive on each machine. Steel construction throughout, self-contained and automatic. Can be placed against wall as all work including lubrication is done from the front.

Century Giant Mixers

Will mix bread, cake and pastry dough; whip eggs and cream; crush fruits; make purees; mash potatoes, etc. In addition Model "U" with jacketed bowl will heat or cool batches while mixing.

All Century Giant Mixers, except Model "B," operate at four speeds. One single lever controls all speed changes without passing through intermediate speeds or disengaging gears. It is impossible to strip gears on a Century Giant Mixer.

Many operating conveniences such as swinging bowl, interchangeable locking attachments, etc., are provided.

Sterling Peelers and Silver Burnishers

In the Sterling line there is a size and model for every requirement—from the smallest lunchroom to the largest hotel, restaurant, institution, club or ship.

STERLING

TRADE-MARK

Sterling products are designed and manufactured by specialists.

Rugged construction throughout assures years of use with minimum upkeep expense.

Abrasive Action STERLING POTATO AND VEGETABLE PEELERS

Potato and vegetable parers are most efficient when both cylinders and discs are lined with abrasive. In the Sterling line, carborundum—the hardest, sharpest and most lasting known abrasive—is used on both cylinders and discs.

The patented Sterling wavy disc with upturned lip on the entire periphery gives a gentle rolling motion to the vegetables while they are being peeled, the lip lifting the vegetables as they meet the cylinder wall which prevents bruising, flats, and waste of vegetables.

Features of Construction

Gears are fully enclosed and run in a bath of oil. All bearings are bronze and of the sleeve type. Motor is mounted above the machine which is the safest location. Electric current switch is within easy reach of the operator whether standing in front of or at either side of peeler. An automatic, overload circuit breaker is built into the switch. Belt drive relieves the motor of starting shock—simple, safe, quiet, fully guarded.

Hinged covers for vegetable peelers are dangerous in that they may fall, crush hands and fingers. The Sterling cover is hingeless.

Sterling Built-in Peel Trap

The Sterling sanitary, built-in peel trap is not a separate accessory requiring special connection to the peeler, but is a cast iron box bolted directly to the peeler base, becoming a part of it, with tapped hole for sewer connections, heavy brass strainer to separate peeling refuse from wash water with opening at bottom under which pail is placed and into which peeling particles fall when plug is drawn.

For Heavy Duty—The Sterling-Victoria Peeler

Similar to machines built for the Government under the most exacting Navy Specifications. Designed for the hardest kind of service on land or sea, the Sterling-Victoria Heavy Duty Vegetable Peeler should be specified where conditions of service are particularly severe.

CAPACITIES OF VEGETABLE PEELERS

Model.....	13-15	16-25	20-40	26-50	Heavy Duty	
					31	32
Pounds of vegetables peeled in an average time of 1 to 1½ minutes.....	15	25	40	50	25 to 30	50 to 60

See the second following page for layout and installation data.

STERLING SILVER CLEANERS AND BURNISHERS

The Sterling Silver Cleaner and Burnisher will polish bright and remove food stains from forks, knives, and spoons of all kinds, the inside and outside of coffee and tea pots, cream pitchers, sugar bowls, and similar articles in solid silver and plated ware.

Preserving silverware and saving labor, the Sterling Silver Cleaner and Burnisher soon pays for itself.

Description—Sterling Silver Cleaners and Burnishers are provided with thick section cast bronze burnishing barrel. The control lever is convenient to the operator. The bronze and steel worm gears are enclosed in an oil-tight gear housing filled with lubrication. All Sterling Burnishers are fitted with special Sterling Ball Traps which not only prevent the burnishing balls which may have been spilled in the tub of the machine from reaching the sewer, but also provide a sewer gas trap.

Model 55

8x12 in.

Capacity

60 pieces of flat silver each run.

Other silver in proportion to size.

Floor Space

28x26 in.

Shipping weight, 325 lbs.

Price, \$345.00

Model 56

8x24 in.

Capacity

120 pieces of flat silver each run.

Other silver in proportion to size.

Floor Space

47x26 in.

Shipping weight, 575 lbs.

Price, \$485.00

Note: These Models are not furnished with silver basket nor rinse tank.

Patent Applied For

Model 60

9¼x12 in.

Capacity

80 pieces of flat silver each run.

Other silver in proportion to size.

Floor Space

42x26 in.

Shipping weight, 425 lbs.

Price, \$500.00

Model 61

9¼x24 in.

Capacity

160 pieces of flat silver each run.

Other silver in proportion to size.

Floor Space

26x61½ in.

Shipping weight, 725 lbs.

Price, \$700.00

Note: These Models are furnished with silver basket and rinse tank.

Models 60 and 61 are fitted with baskets to remove silver after it has been burnished, and built-in rinse tank connected for hot water supply and overflow drain. The silver basket protects the operator as it is dangerous to feel around in the burnishing balls for burnished silver when this silver consists of sharp knives and sharp fork tines. Burnished silver should be rinsed at once and the Sterling built-in rinse tank is very convenient for this purpose.

Models 60 and 61 have 27% more volumetric capacity than the Models 55 and 56 which have burnishing barrels 8x12 in. and 8x24 in. respectively.

Sterling Silver Cleaners and Burnishers are shipped complete, set up, and ready to run. They are supplied with "Silvergleam" burnishing balls, automatic safety electric switch, and a sufficient supply of Scap, the non-poisonous, free from abrasive, cleaning compound to last several months.

See following page for layout and installation data

THE HOBART MANUFACTURING CO.

Makers of Electrical Food-Preparing Machines for Commercial and Institutional Kitchens and Bakeries

TROY, OHIO

NEW YORK OFFICE, 40 East 22nd Street

CHICAGO OFFICE, 308 West Randolph Street

SALES AND SERVICE OFFICES IN ALL PRINCIPAL CITIES

Products

Hobart Products include the following items of KITCHEN and BAKERY EQUIPMENT: Mixers (which operate a full line of attachments), Food Cutters, Meat and Food Choppers, Coffee and Spice Mills, Potato Peelers, Vegetable Slicers and Meat and Bread Slicers. These machines are built complete in the Hobart Factories and are powered by *fully guaranteed* Hobart-built Electric Motors.

Where Used

Hundreds of thousands of Hobart Machines are in daily use and are regarded as standard equipment by outstanding hotels, hospitals and other institutions, restaurants, cafes and bakeries. A list of users will be furnished on request.

Hobart Super Mixer
Capacity of bowl is 80 qts. 40, 30 and 20-qt. bowls available

Hobart Model S-60 Mixer

Capacity of bowl is 60 qts. 30-qt. bowl also available

Hobart Model KP-20 Mixer

Capacity of bowl is 20 qts.

Hobart Model C-10 Mixer

Capacity of bowl is 10 qts. 3-qt. bowl also available

Hobart Model S-30 Mixer

Capacity of bowl is 30 qts. 20-qt. bowl also available

Hobart Model T-80 Mixer

Capacity of bowl is 80 qts. 40, 30 and 20-qt. bowls also available

Hobart Potato Peeler
Model 6020

Hobart Potato Peelers are built in three sizes ranging in capacities from 12 to 45 lbs. of potatoes peeled in 90 seconds with a new low level of 10% peel loss

Hobart Bench Type Potato Peeler
Model 6015

Hobart Vertical Mixers

Sizes—Hobart Mixers are built in 3, 5, 10, 15, 20, 30, 40, 60 and 80-qt. sizes. There is a model to fit any size kitchen or task. The motors range from $\frac{1}{16}$ to 2 hp.

Functions—Hobart Mixers will mix bread, rolls, pie, cake and all pastries; blend mayonnaise and other dressings; mash potatoes; beat eggs, batters, custards, and other mixtures; whip cream, icing, marshmallow, meringue, etc.

With attachments they chop meats, fruits, vegetables, etc.; grind coffee, spices, cereals; slice potatoes, vegetables, fruits; crumb dry bread, cakes, crackers; sieve fruits, sauces, pumpkin, etc.; strain soups, purees, etc.

Hobart Food Cutter
Model T-215-GA

Hobart Food Cutters are made in two sizes. They represent a great advance over ordinary cutters in speed, thoroughness, safety, ease of cleaning and economy of space. They will cut all vegetables and firm fruits, coconut, citron, nuts, boiled eggs, meats—practically any food

Service Department

Hobart is ready at all times to co-operate with architects. The Architect's Data Book, A.I.A. File No. 31h2, which contains weights, dimensions, capacities and technical details of all Hobart Machines, will be furnished on request. A nation-wide corps of Factory-trained Service Men can quickly make any necessary adjustments or repairs.

Advantages

Hobart Machines are speedy. They prepare all foods with great savings in time, labor and materials. Their vigorous mechanical action and perfect blending of all ingredients improve the flavor of all foods.

READ MACHINERY COMPANY, INC.

Manufacturers of Bakery Machinery

YORK, PA.

SALES AGENCIES IN ALL PRINCIPAL CITIES

Products

Complete EQUIPMENT for BAKERIES; MIXING MACHINES for hotels, restaurants, hospitals, institutions, etc.

Service Department

The READ MACHINERY COMPANY, INC., is a specialist in modern bakery equipment. An extensive service department is maintained and is available at all times to architects. Our engineers will gladly co-operate with and assist architects when planning bakeries, kitchens for hotels, hospitals, restaurants and institutions without cost, and will furnish drawings and specifications.

Layouts, data sheets, general catalogues, photographs, standard specifications and preliminary drawings are supplied on request and are part of the service offered by this Company.

Read Vertical Mixers

For use in bakeries, also pastry and kitchen departments.

The mixer is made in five models. Entire operation of machine controlled by one lever, accessible from three sides, which starts and stops motion of beaters and gives variable speeds.

Beaters are rapidly attached or detached by spring clip.

Bowls are mechanically raised by hand wheel and are easily removable.

All parts accessible and easily cleaned. Supplied with motor or belt drive.

All models are of heavy construction, simple to operate, silent running and practically foolproof. Maintenance cost is low. Wide range of work. Used for every kind of mixing, beating, whipping and creaming operation.

An auxiliary drive socket is placed on the left side of Types "G," "D," "H" and Master Mixer at no additional cost for the operation of attachments, such as—meat grinder, coffee mill, vegetable slicer, bread crumbler, nut grater, ice crusher, etc.

CAPACITY, DIMENSIONS AND WEIGHT, VERTICAL MIXERS

Type	Max. cap., qt.	Motor, h.p.	Floor space, in.	Height, in.	Weight, lb.
G	30	1½	24 x 34	63	900
G	60	¾	24 x 37	63	900
D	80	1	24 x 44	69	1,400
H	100	2 & 3	27½ x 44	69½	1,850
Master	140	3 & 5	34 x 43½	66	2,435

Read "Mixonette" (General Use)

The "Mixonette" has been designed to perform the various kitchen duties in hotels, restaurants, hospitals, institutions,

cafeterias, clubs, soda fountains, and also for mixing work in bakeries and candy factories.

Used for mixing, beating, whipping, grating, slicing, straining, mashing, grinding, etc.

Has all the favorite and exclusive Read features—the frame is of rigid construction with all parts accurately machined; selective type of transmission two speeds; gears run in grease; oilless bushings used throughout; one lever controls the speeds and starts and stops the motion of the beater. A driving socket is provided at head of machine, used for operating special attachments.

Standard equipment supplied—12-qt. bowl, wire whip and batter beater. 5-qt. equipment furnished at slight additional cost.

The driving socket can be used for operating meat grinder, coffee mill, vegetable slicer, bread crumbler, nut grater, and other attachments which can be furnished when ordered.

Read No. 5 Automatic Sifting and Mixing Outfit

Outfit consists of a flour dump bin, elevator, conveyor, cone sifter and single-arm mixer. (The size of the mixer determines the size of the outfit.) It is a self-contained unit and is shipped completely assembled. Flour is automatically carried from the dump bin to the cone sifter where it is thoroughly cleaned and aerated and then deposited into the mixer. Doughs are rapidly and thoroughly mixed in the single-arm dough mixer.

Products

"WEAR-EVER" ALUMINUM STEAM JACKETED KETTLES and URNS; RANGE UTENSILS.

The Company and Its Products

For 30 years THE ALUMINUM COOKING UTENSIL CO. has manufactured and distributed "Wear-Ever" aluminum cooking utensils for use not only in homes, hospitals, hotels and on shipboard, but everywhere that cooking is done.

Constant advertising during these years has brought a recognition of the value of aluminum from housekeepers, chefs and stewards. Each year it has also secured the approval of an increasing number of architects.

Advantages of Aluminum for Cooking Utensils

Lightness—Bulk for bulk, the weight of aluminum is about one-third that of iron or tin, three-tenths that of copper and one-quarter that of silver. This difference in weight means much in the hot, hurried conditions of some kitchens.

Heat Conductivity and Specific Heat—In heat conductivity, aluminum ranks twice as high as tin and three times as high as iron. In specific heat (heat retaining ability) aluminum outranks all metals by a large margin. The combination of these two characteristics makes aluminum pre-eminently suitable for cooking. By its use an even cooking temperature is easily maintained. Aluminum vessels cook not only from the point under which heat is applied, but also from every other point where the utensil is in contact with the food.

Non-effect of Acids on Aluminum—Aluminum is not affected by food acids. Theoretically there is some action—practically there is none. Most important of all is the fact that any

such action that could possibly take place would not produce a combination that would be poisonous.

Aluminum never forms a poisonous compound with any food. It is therefore unnecessary to tin the surface of an aluminum utensil as is the case with other metals such as copper.

Economy and Durability—"Wear-Ever" utensils are good for years of continuous service. They are decidedly economical,

for not only is there no tinning expense, but there is no time lost in sending out the utensils to be tinned. One large nationally known hotel put in a complete equipment of "Wear-Ever" at a total cost of \$2300, and, according to their own statement, have saved \$100 in tinning bills every month since the equipment was installed.

Sanitary Qualities and Non-absorption of the Surface—The metal used in "Wear-Ever" equipment is rolled under tremendous pressure, giving a sheet that is hard, dense, and smooth. It is easy to clean, and because of its density, food will not penetrate the pores of the metal and later contaminate other foods cooked therein.

Special Consultation Services to Architects

At each of the branch offices listed above, there is a man who, through years of training and experience is able to render valuable assistance to an architect in laying out kitchen equipments and in writing specifications. These men are glad to render assistance when asked to do so.

Catalogue

An 80-page book and catalogue showing the complete line of jacketed equipment and range utensils will be sent promptly in answer to a request sent either to the home office or to any of the branch offices.

A Few Typical Installations of "Wear-Ever" Kettles

Steam Jacketed Kettle Type 1

This kettle is jacketed to the top, insuring maximum results. Its uses are many and varied—roasting meat, canning and preserving fruits, etc. Being shallow and broad, it is ideal for cooking cereals of all kinds and dried fruits. The fruit is not crushed by its own weight as it would be in a deeper, narrower kettle.

Steam Jacketed Kettle Type 3

This kettle is jacketed two-thirds of the way up and offers maximum cooking capacity for the floor space occupied. It is particularly recommended for cooking delicate foods. Scorching is prevented by the evenness of the heat distribution and the ease in controlling the amount used. Foods and meat allowed to stand in "Wear-Ever" steam jacketed kettles will not darken.

Liberty Urn

The Liberty urn is an outgrowth of the United States Government's need for a plain urn that could be produced quickly in large quantities. Like all other "Wear-Ever" equipment, it requires no tinning, and, because of its shape, is easily and quickly cleaned. Its entire surface, inside and outside, is readily accessible. Because of simplicity of construction, cost of labor and material to make it is comparatively small; the selling price is quite reasonable. Arrow shows glass gauge protected by aluminum tubing indicating contents in gallons.

Encased Urn

The encased urn is more beautiful than the Liberty urn and consequently is preferable if appearance is of greater importance than utility or price. Both this urn and the Liberty urn are fitted with covers, cover lifting device, stand, gauge glass protected by aluminum tube which also forms an indicator showing the contents of the urn in gallons, 1-in. spigot, steam inlet and outlet and ring for coffee bag (coffee bags not supplied). The 20 and 25-gal. sizes can be furnished either with or without cover lifting device.

Kettles and Urns for Hotels, Restaurants and Hospitals

The uses of the kettles and urns illustrated are described under the illustrations of each type. The number of each to use for various conditions is given under the general notes.

Standard Specifications

Furnish and install where shown on plans, "Wear-Ever" kettles and urns as follows.

Type No. 3 Kettle—..... (quantity) "Wear-Ever" aluminum steam jacketed kettle(s), gal. capacity, Type No. 3, two-thirds jacketed, complete with machine steel stand, safety valve, hinged cover, aluminum draw-off pipe, faucet, strainer and collar for vapor pipe. Kettles to be constructed so that steam inlet and outlet fittings can be easily removed. Baffle plate and inlet fitting shall be integral. Both shell and jacket to be made from cold rolled, hard, thick sheet aluminum, and joined together by a line of rivets spaced not more than 2½ in. on centers. Edge of jacket where it comes in contact with shell to be welded to the shell by the oxy-acetylene process. (Kettles 100 gal. and larger shall have shell and jacket stayed with 3 tubular stays.) Legs of the stand to be welded securely to the stand and draw-off support to be attached to legs by the electric arc welding process.

Type No. 1 Kettle—..... (quantity) "Wear-Ever" aluminum steam jacketed kettle(s), gal. capacity, Type No. 1, full jacketed, complete with machine steel stand, safety valve, hinged cover, aluminum draw-off pipe, faucet, strainer and collar for vapor pipe. Kettle(s) to be constructed so that steam inlet and outlet fittings can be easily removed. Baffle plate and inlet fitting shall be integral. Both shell and jacket to be made from cold rolled, hard, thick sheet aluminum and joined together by a line of rivets spaced not more than 2½ in. on centers. Edge of jacket where it comes in contact with shell to be welded to shell by oxy-acetylene weld. (Kettles 60 gal. and larger shall have shell and jacket stayed with 3 tubular stays.) Legs of the stand to be welded securely to the stand and draw-off support is to be attached to legs by electric arc welding process.

Liberty Urn—..... (quantity) "Wear-Ever" aluminum Liberty institution urn(s), steam jacketed, gal. capacity, complete with stand, safety valve, draw-off pipe, faucet, gauge glass, dome-shaped cover, cover lifting device and coffee bag ring. To be made of two hard sheet aluminum plates joined together with one row of round head aluminum rivets spaced not more than 2½ in. on centers. Edge of jacket where it comes in contact with shell to be welded to shell by the oxy-acetylene process. Urn(s) to be constructed so that steam inlet and outlet fittings can be easily removed. Baffle plate and inlet fittings shall be integral. Legs to be welded securely to stand and draw-off support to be attached to legs by electric arc welding process. Urn(s) to have ¾-in. cold water inlet fitting placed in back and as near top as possible. To have indicator bar spaced in multiples of 5 gal., said indicator bar and gauge glass protector to be one and the same.

Encased Urn—..... (quantity) "Wear-Ever" aluminum encased institution urn(s), steam jacketed, gal. capacity. Body made of two hard sheet aluminum plates joined together with one line of round head aluminum rivets, spaced not more than 2½ in. on centers and welded by the oxy-acetylene process. Body to be encased in highly polished sheet aluminum casing, fitted on black enameled legs, and fitted with high grade faucet, dome-shaped cover, cover lifting device and coffee ring bag. Urn(s) to be constructed so that steam inlet and outlet fittings can be easily removed. Baffle plate and inlet fittings shall be integral. Urn(s) to have ¾-in. cold water inlet fittings placed in back and as near top as possible. To have indicator bar spaced in multiples of 5 gal., said indicator bar and gauge glass protector to be one and the same. All connections of steam pipe, etc., will be made under another contract.

General Notes—Kitchen Location—Space and design permitting, kitchen should be a one-story wing with windows on opposite sides and monitor roof to provide maximum ventilation. Avoid locating kitchen in basement. In hotels, group the dining rooms with service pantries around kitchen. General hospitals require a different arrangement, as general diet is cooked in main kitchen and distributed to ward dining rooms by dumb-waiters or trucks on elevators.

Kitchen Construction—Experts recommend quarry tile, enameled brick, glazed or matt tile or concrete for floor finish in the order named; for walls, a wainscot 6 ft. high of enameled brick or tile.

Kitchen Arrangement—Jacketed kettles are best arranged in batteries away from walls and directly under monitor skylight or hood to carry off vapors. Minimum space given in Figs.

6 and 7 is for cleaning purposes. Less space will not affect efficiency of apparatus. Vapor exhaust pipes are not recommended, but when used they should be of Monel metal.

Installed at Wall Installed in Batteries
Typical "Wear-Ever" Kettle Arrangement

Steam Mains—2-in. for 20 kettles or less, when kettles are near boiler and steam main properly insulated; 3-in. when pipes have many turns or valves, are not insulated or kettles are a great distance from boiler.

Aisle Space—Should be ample to insure efficient serving. Where trucks are used, minimum aisle width is 4 ft.

Kettle Sizes—Depend on number of persons served and time allowed for it. The following figures will serve as a guide for the number, type and size required.

Hotels	
100 rooms.....	One 40-gal. Type 3, complete with hinged cover
	One 50-gal. Type 3, complete with hinged cover
200 rooms.....	One 25-gal. Type 3, complete with hinged cover
	One 10-gal. Type 3, solid bottom, no cover
	One 75-gal. Type 3, complete with hinged cover
500 rooms.....	Three 60-gal. Type 3, complete with hinged cover
	One 20-gal. Type 3, solid bottom, no cover
	Two 100-gal. Type 3, complete with hinged cover
	Two 75-gal. Type 3, complete with hinged cover
800 rooms.....	One 60-gal. Type 3, complete with hinged cover
	One 25-gal. Type 3, solid bottom, no cover
	One 40-gal. tilting kettle
	Four 100-gal. Type 3, complete with hinged cover
1000 rooms.....	Three 80-gal. Type 3, complete with hinged cover
	One 60-gal. Type 3, complete with hinged cover
	One 25-gal. Type 3, complete with plain cover
	One 25-gal. Type 3, solid bottom, no cover
	One 60-gal. tilting kettle
Hospitals	
50 beds.....	One 25-gal. Type 1, complete with hinged cover
	One 25-gal. Type 1, complete with hinged cover
150 beds.....	One 40-gal. Type 1, complete with hinged cover
	One 30-gal. urn (encased or Liberty)
	Two 60-gal. Type 1, complete with hinged cover
250 beds.....	One 50-gal. urn (encased or Liberty)
	One 10-gal. Type 1, solid bottom, no cover

Installation Notes—Equip steam inlet of each fixture with safety valve and globe type shut valve. Equip steam outlet pipe of each fixture with automatic steam trap and globe type shut valve. Where steam pressure exceeds 40 lb. per sq. in., a reducing valve must be installed in main line. Concealing supply and return pipes is not recommended. Suitable covering of pipes up to fixtures is advised.

Manufacturers of Food Service Equipment

526-544 Gregory Avenue
WEEHAWKEN, N. J.

Products

MODERN and SANITARY FOOD SERVICE EQUIPMENT for PUBLIC SERVICE ESTABLISHMENTS:

General Equipment:

Coffee Urns, Urn Stands, Milk and Cream Dispensers.

Kitchen Equipment:

Ranges, Hoods, Cooks' Tables, Work Tables, Pot Racks, Steam Cookers, Meat Roasters, Sinks, Dishwashers, Dish Tables, Bake Ovens, Potato Peelers.

Cafeteria Equipment:

Cafeteria Counters, Steam Tables, Cold Bain Marie Pans, Display Cases.

For our page on Heavy Duty Kitchen Sinks and Cooks' Tables refer to Manufacturers' Index.

Installations

The following are the names of a few representative institutions using *Blickman* equipment:

Schools

Monastery of Immaculate Conception, Jamaica, L. I., N. Y.
Memorial High School, West New York, N. Y.
Newman High School, Lakewood, N. J.
Sessions Street School, Providence, R. I.
Esek Hopkins Junior High School, Providence, R. I.
George J. West Junior High School, Providence, R. I.
Cranston High School, Cranston, R. I.
The Bridgham School, Providence, R. I.
Francis Junior High School, Washington, D. C.
Randall Cardoza Junior High School, Washington, D. C.
Hine Junior High School, Washington, D. C.
Stuart Junior High School, Washington, D. C.
Coughlin High School, Wilkes-Barre, Pa.
Andrew Curtin High School, Williamsport, Pa.
Miami High School, Miami, Fla.

Hospitals

U. S. Naval Hospital, Puget Sound, Washington
Brooklyn State Hospital (State of New York, Creedmore, L. I.)
Harlem Valley State Hospital (State of New York, Wingdale)
New York State Psychiatric Hospital (State of New York, 168th Street and Haven Avenue, New York, N. Y.)
Rochester State Hospital, Rochester, N. Y.
St. Peter's Hospital, Albany, N. Y.
U. S. Naval Hospital, Chelsea, Mass.
North Hudson Hospital, Weehawken, N. J.
St. Luke's Hospital, Bethlehem, Pa.
Community Hospital, Glasgow, Ky.
Community Hospital, Wauseon, Ohio
Community Hospital, Beloit, Kansas

Institutional, Industrial and Commercial Installations

THE PROMETHEUS ELECTRIC CORP.

ESTABLISHED 1901

352 West 13th Street, NEW YORK, N. Y.

Products

ELECTRICAL HEATING, WARMING, DRYING and STERILIZING EQUIPMENT and APPLIANCES, including: Plate Warmers; Combination Plate Warmers and Towel Dryers; Clothes Dryers; Electric Organ Loft Heater; Electric Radiators, with and without Thermostatic Control; Instrument Sterilizers.

Proved by Many Years of Service

Since 1901 Prometheus Electric products have enjoyed a reputation for quality and long service.

Prometheus appliances are extensively used in residences, hotels and clubs of the highest class, including the Astor, Cosden, Patterson, Deering, Ford, Frick, Harriman, Rockefeller, Schiff, Speyer and Vanderbilt residences, the Brook Club, Hotel Sherry-Netherland and the Waldorf-Astoria. Notwithstanding their high quality, their moderate prices make them available for residences and apartments of moderate cost.

Architects who specify Prometheus specialties include Eberson & Eberson, Delano & Aldrich, Schultze & Weaver, Walker & Gillette, and Charles A. Platt, of New York; Meade & Hamilton of Cleveland; and Hoffman-Henon Co. of Philadelphia.

Prometheus Plate Warmer

Used in the butler's pantry, kitchen, or hospital ward for warming dishes and food. Prevents breakage of china and preserves the original delicious flavor of the food. Operates by a mere turn of the three-heat electric switch—no fire, smoke, steam or odor. Approved by the National Board of Fire Underwriters.

Construction—Substantial welded angle iron frame with double walls, thoroughly lagged. Shelves built on heavy iron rod, and supported on angle iron brackets. All interior fittings are removable. Can be had with vitreous enamel doors in white or color, also with monel metal top which can be used as a hot plate. All fittings are chrome plated.

Thermostatic Cut-off and

Heating Element—By a patented arrangement, the heating units are contained in shallow flues, attached to the walls of the interior, so that water or gravy which may be spilled can not cause a short circuit. Heating elements never become red-hot. Can also be had with a patented thermostatic cut-off.

Although plate warmers are usually built to architect's specifications, we also make the following stock sizes:

Type	Outside dimensions			Current consumed, watts
	Wide	High	Deep	
800	18"	18"	18"	400
801	18"	18"	18"	400
802	25"	24"	18"	600
804	36"	30"	20"	800

Outside finished in Russia iron. Doors finished in porcelain enamel. All types except No. 800 have chrome plated trimmings. When ordering plate warmers to be built to specifications, kindly give the following information:

Trim Extension—This is the distance the chrome plated trim should extend beyond the body of the plate warmer in order to cover up the crevice between the wall and the plate warmer if the plate warmer is of the built-in type. Otherwise the trim will be flush with the body.

Position of Leads—Leads may be brought out at any specified point.

Voltage—Do not fail to give the voltage of the line on which the plate warmer is to operate.

Blue Prints—Write for blue prints.

Clothes and Towel Dryer

Usually built to order to fit space available. There are two stock sizes: No. 810, 2 towel racks, 20 in. wide, 30 in. high, and 22 in. deep, \$125.00. No. 812, 4 towel rack, 36 in. wide, 30 in. high, and 22 in. deep, \$150.00.

PROMETHEUS
TRADE-MARK

Flush Type Bathroom Heater

The new type 370 bathroom heater has a heavy cast iron face plate, covered with vitreous porcelain enamel. Supplied in a variety of colors.

The three-heat switch is built into the heater.

The heating element is protected with a monel metal guard.

Type 370 and 371

Type 350 and 351

The type 350 heater has a highly polished monel metal grill. The heating element is of the convection type, insuring an even distribution of heat throughout the bathroom.

Type No.	Watts	Register		Body		
		Height	Width	Height	Width	Depth
370	1500	16½"	15"	15½"	12"	4"
371	2000	16½"	15"	15½"	12"	4"
350	800	15"	15"	13½"	13½"	3½"
351	1500	15"	15"	13½"	13½"	3½"

Combination Plate Warmers and Towel Dryers

For kitchens and serving pantries in residences and clubs. They are built in two sections. One has shelves and serves as a plate warming cabinet, while the other, fitted with racks, serves for drying towels. Built to specifications.

Prometheus Thermostatically Controlled Electric Organ Loft Heater

A specially designed Prometheus thermostatically controlled heater for pipe-organ room heating. Maintaining an even temperature, it protects organs against cold and deterioration from dampness.

Three sizes: No. 331, 1000 watts and No. 332, 2000 watts. Both 16 in. long, 14½ in. high, 4 in. deep.

Prometheus Electric Radiators

These heaters are for permanent heating service. They are of the convection type—similar to a steam or hot water radiator. They are attractive in appearance; provide an abundance of clean, uniform heat. Made in sizes up to 3000 watts.

Sterilizers

For dentists, physicians and hospitals are shown in our complete catalogue.

Electric Food Trucks

For economical distribution of food from diet kitchen to wards.

Therapeutic Lamps

A fully illustrated catalogue showing a complete line of infra red and arc lamps.

Write for a complete catalogue of above products.

EDISON COMMERCIAL ELECTRIC COOKING AND BAKING EQUIPMENT. Architect's Hand Book on Request.

A complete line of electrically heated Bake and Roasting Ovens, Ranges, Broilers, Urns, Steam Tables, Stock and Fry Kettles, Griddles, Waffle Irons and Toasters.

For Hotpoint Electric Water Heaters, Electric Air Heaters, Domestic Electric Ranges, see Manufacturers' Index.

Edison Electric Commercial Cooking Equipment

The EDISON GENERAL ELECTRIC APPLIANCE CO., INC., is the world's largest manufacturer of commercial electric cooking and baking equipment. In thousands of hotels, restaurants, hospitals, clubs and institutions this equipment is giving superior service.

This equipment is the result of fifteen years' experience. The patented Calrod Unit in Edison ranges, etc., provides lasting service, speed in heating up, and above all, dependability. Upkeep of apparatus equipped with this type of unit, particularly hotel range cooking tops, is therefore reduced to a minimum.

Edison Electric Baking and Roasting Equipment

Hotel and restaurant bakers prefer Edison electric ovens for the many advantages obtained, including the better bread and pastries which can be produced. The evenly distributed heat penetrates with equal intensity every portion of the baking chambers. Baking is done to precision—there is no haphazard guesswork.

The design of Edison ovens greatly conserves floor space in hotel and restaurant bakeries, and on account of the fact that there is no ventilation problem, the bakery can be located in the most convenient place.

Diversity of baking can be obtained with Edison ovens through the perfect insulation between compartments and the separately controlled heating elements for each. With a three-deck oven, bread may be baked in one chamber, pies in another and meat may be roasted in the third.

Ovens can be obtained in one, two or three chambers. The Ad-A-Deck type additional chambers can be added at any time to the one or two-deck ovens.

A GENERAL

ELECTRIC

ORGANIZATION

EDISON

Location

Edison electric kitchens and bake shops can be located in any part of a building, wherever space is most economical and convenient, with less consideration to ventilation and other conditions than for any other type of equipment.

Efficiency

When Edison electric cooking equipment is used, all old time requirements for location of the different items in the kitchen layout may be forgotten—positions made necessary due to operating temperatures, flues, fuels, etc. A freedom of arrangement, based only on reducing steps taken by cooks, waiters, busboys, etc., with greatly improved general efficiency and economy is possible.

Space Saving

Due to the flexibility in capacity and arrangement, Edison electric equipment conveniently and easily permits larger production than fuel units of equal size. For instance, three Edison ranges have a production capacity equal to five fuel ranges. Each range is really four in one, due to the four independently controlled hot plates. In the bakery, too, space can be saved. For each deck of the Edison electric oven is, in effect, an entirely separate, independently insulated and controlled oven. Surprisingly economical operation is assured by operating a smaller oven over the longest period of time, rather than a larger oven—or several ovens—for shorter periods.

Edison Kitchen Equipment Service

As the world's largest manufacturer of electric cooking and baking equipment, we have had extensive experience in planning the most efficient, modern electric kitchens. Our specialized experience will be helpful and profitable to you and your clients. Our layout and planning service is offered without cost or obligation.

We can be of the greatest assistance if you will call us in the preliminary stage of planning kitchen or bakery equipment—whether or not you have decided on electric cooking and baking. We guarantee the adequacy of the equipment we recommend. In all cases this will include a sufficiently large reserve capacity to handle any maximum demand that may ever be experienced.

A Corner of Our Layout Service Department

Kitchen and Bake Shop of the New Forum Cafeteria, St. Louis, Mo.

TYPICAL BAKING AND ROASTING OVENS

NA67—Automatic
N67—Non-automatic

Classification—Utility baking oven.

Dimensions—38 in. wide, 39 in. deep, 65½ in. high. Each compartment 18⅝ in. wide, 28¾ in. deep, 8 in. high.

Capacity—Baking area, 7 sq. ft. (20 1-lb. loaves).

Wattage and Voltage—5 kw. Standard voltage—110 or 220 (can be 120, 200 or 240) a-c. (single or 3-phase) or d-c. circuit.

Finish—Standard, battleship gray—black enamel trim. Special, white porcelain, monel, or nickel-chromium steel, with trim to match.

NA57—Automatic
N57—Non-automatic

Classification—“Ad-A-Deck” portable baking oven, sectional type.

Dimensions—62¼ in. wide, 75 in. deep, 77 in. high. Each compartment 37⅝ in. wide, 57 in. deep, 8 in. high.

Capacity—Baking area, 45 sq. ft. (120 1-lb. loaves).

Wattage and Voltage—16.2 kw. Standard voltage—110 and 220 (can be 120, 200 or 240) a-c. (single or 3-phase) or d-c. circuit.

Finish—Standard, battleship gray—black enamel trim. Special, white porcelain, monel or nickel-chromium steel, with trim to match.

NA123—Automatic
N123—Non-automatic

Classification—“Ad-A-Deck” portable roasting oven, sectional type.

Dimensions—56⅞ in. wide, 40⅞ in. deep, 62 in. high. Each compartment 37⅝ in. wide, 28¾ in. deep, 12 in. high.

Capacity—Roasting area, 14 sq. ft. (250 lb. meat, or 40 1-lb. loaves).

Wattage and Voltage—10 kw. Standard voltage—110 or 220 (can be 120, 200 or 240) a-c. (single or 3-phase) or d-c. circuit.

Finish—Standard, battleship gray—black enamel trim. Special, white porcelain, monel, or nickel-chromium steel, with trim to match.

TYPICAL KITCHEN EQUIPMENT

442 R116
Cooking Top Only

Classification—Heavy duty cooking top. (Range also furnished with oven.)

Dimensions—48 in. wide, 43 in. deep, 31¼ in. high. Storage space, width 27 in., depth 29½ in., height, upper compartment 11¼ in., lower compartment 10 in.

Capacity—Area of hot plates, 6 sq. ft. Size of hot plate area, 24x36 in.

Wattage and Voltage—16 kw. Standard voltage—110 or 220 (can be 120, 200 or 240) a-c. (single or 3-phase) or d-c. circuit.

Finish—Black enamel.

435 K11

Classification—Stock kettle.

Dimensions—24 in. wide, 27 in. deep, 44¼ in. high. Diameter of container, 18¾ in.

Capacity—20 gal.

Wattage and Voltage—5 kw. Standard voltage—110 or 220 (can be 120, 200 or 240) a-c. (single phase) or d-c. circuit.

Finish—Body—black enamel; top—polished nickel.

434 KA15—Automatic

Classification—Fry kettle.

Dimensions—18¼ in. wide, 28¼ in. deep, 31¼ in. high. Grease container 12 in. long, 16 in. wide.

Capacity—Fat—45 lb.

Wattage and Voltage—4 kw. Standard voltage—110 or 220 (can be 120, 200 or 240) a-c. (single or 3-phase) or d-c. circuit.

Finish—Standard, black japan—polished steel top. Special, polished monel—nickel trim.

THE INTERNATIONAL NICKEL COMPANY, INC.

Monel Metal and Nickel and Allied Products

EXECUTIVE OFFICES

67 Wall Street, NEW YORK, N. Y.

MINES AND SMELTER: Copper Cliff, Ont., Canada

For Our Other Products, see Manufacturers' Index

Products

MONEL METAL—available from stocks conveniently located throughout the country and made in all commercial forms required by manufacturers of food service equipment. (See Manufacturers' Index, our section on Metals, for commercial forms and location of warehouses.) All necessary accessories such as nuts, bolts, screws, rivets, etc., are also available.

Monel Metal

Monel Metal is a registered trade-mark applied to a technically-controlled nickel-copper alloy of high nickel content. Monel Metal is mined, smelted, refined, rolled and marketed solely by International Nickel.

Advantages of Monel Metal for Food Service Equipment

- (1) Absolutely rustproof.
- (2) Resists corrosion by food juices and fruit acids.
- (3) Strong as steel; tougher than steel.
- (4) Easy to clean; therefore sanitary.
- (5) Beautiful appearance; has color of platinum.
- (6) Durable—proven by over 20 years of service.
- (7) Easily fabricated.

Proven Uses of Monel Metal in Food Service Equipment

Monel Metal is used for all exposed surfaces where appearance, cleanliness, and long life are required in the following types of equipment:

Bake Ovens—Linings, exterior or trim.
Bins (bakers', vegetable, etc.)—All Monel Metal.
Butter Serving Machines—Parts in contact with butter.
Cabinets (kitchen)—All Monel Metal.
Canopies and Hoods—All Monel Metal.
Checkers' Desks—All Monel Metal.
Coolers, Water—Exterior or trim, drains.
Counters (display, cafeteria)—All Monel Metal.
Cutlery Boxes—All Monel Metal.
Dispensers (milk, cream)—Monel Metal exterior or trim, solid nickel lining.
Drainboards—All Monel Metal.
Dish Carriers—All Monel Metal.
Dishwashing Machines—All Monel Metal.
Egg Timers—All Monel Metal.
Fish Chests—All Monel Metal.
Garde Manger—All Monel Metal.
Grills (bacon, etc.)—All Monel or with Monel cooking surfaces.

*Insets (steam tables)—Solid nickel.

*Kettles (steam jacketed)—Solid nickel.

Railings (cafeteria, etc.)—All Monel Metal.

Ranges—Oven linings, fronts, sides, back shelves, flue pipes.

Refrigerators—Linings, facings, trim, shelving.
Shelving—All Monel Metal.

Sinks (vegetable, scullery, dish, etc.)—All Monel Metal.

Slicing Machines—All parts in contact with food.

Steamers (vegetable)—Linings and baskets.

Steam Tables—All Monel or with Monel top and trim.

Tables (bakers', cooks', dish, work, etc.)—Monel Metal top and shelf.

Trucks (food)—All Monel Metal or Monel trimmed.

Urns (coffee, chocolate, hot water)—Linings and exteriors.

Urn Stands—All Monel or with Monel top and trim.

Waffle Irons—Monel exteriors.

Warmers (roll, plate, cup food)—All Monel or with Monel top and trim.

Services

Architects and engineers are invited to make use of the extensive advisory service maintained by this organization. A call to any of our sales offices, listed in our section on Metals, will bring you a Monel Metal specialist. In co-operation with kitchen equipment engineers, Monel Metal specialists can contribute materially in the application of Monel Metal to food service equipment.

Available Publications

To assist architects and engineers to form a clearer conception of the possibilities for the application of Monel Metal, The INTERNATIONAL NICKEL COMPANY, INC., has prepared a series of reference folders and booklets, available upon request.

"Architects' Food Service Handbook"—A reference book prepared for the profession. Contains complete information on the design and construction of food service equipment, choice of materials of construction and illustrations of correct method of writing specifications for all types of equipment.

"Architects' Reference File"—Series of folders concerning architectural uses of Monel Metal especially prepared for architects and engineers.

- (1) Food Service.
- (2) Hospital.
- (3) Home Kitchen.

*For the actual cooking and storage of foods we recommend solid nickel.

Ranges, Hoods, Ovens and Steamers

Monel Metal Used in Kitchens is Lustrous, Easy to Clean and Well Suited for Exteriors as Well as Linings

Warmers, Storage Cabinets, Coffee Urns and Stands

Monel Metal Counter Linings Are Not Only Pleasing to Patrons' Eyes but Easy to Keep Clean and Sanitary

"Food Service Applications"—A series of illustrated folders describing in pictorial form the applications of Monel Metal to outstanding architectural developments.

- (1) Sherry-Netherlands.
- (2) Girard College.
- (3) Medical Center of New York.
- (4) S.S. Malolo.
- (5) The Stevens Hotel.

"Monel Metal"—"Official Bulletin of Approved Products" by the Investigating Committee of Architects and Engineers.

"Monel Metal in Modern Architecture"—A booklet illustrating various architectural uses to which Monel Metal may be put.

"The Merchandise Mart Restaurants"—An illustrated folder of the kitchen and service equipment in the restaurants in Chicago's Merchandising Mart.

"Traveling in Luxury on a World Famous Train"—A description with photographs of the kitchen equipment of the Twentieth Century Limited.

"Everywhere You Go"—Illustrated booklet showing various food service installations throughout the country.

"Relation of Beverage Coffee to Metals"—Dealing with the use of Monel Metal in coffee urns, this booklet is an analysis of the effect of metals on the taste of coffee.

"That the Public May Be Pleased"—The use of Monel Metal in the restaurants of the Savarins, Inc.

"Modern Kitchens"—A handbook of the uses of Monel Metal in all types of food service equipment and dealing with the specification of quality equipment. Included in the book are advertisements of manufacturers of all types of equipment.

Monel Metal Provides a Resistance to Corrosion Which is an Important Feature in Dishwashers, Dish Tables, Sinks and Storage Cabinets

In the Modern Coffee-shop, Monel Metal Serving Counters Are Ornamental as Well as Useful Due to Their Platinum-like Beauty

"Kitchen Police Holds No Terrors at West Point"—A pictorial description of the feeding system of the U. S. Military Academy, showing the newest developments in the design of kitchen equipment.

"The Hotel New Yorker"—This new hostelry offers many suggestions in the design of kitchen and "front of the house" service equipment. The many novel features of the installation are completely illustrated and described in this folder.

"Modern Fountains"—A booklet on Monel Metal soda fountains.

Long Service Life of Monel Metal Equipment

Illustrative of the long-service-life of Monel Metal food service equipment are the following prominent installations, a few of the many that are still serving their owners faithfully after years of severe service.

Name	Year Installed
Hotel Statler, Cleveland, Ohio	1912
Hotel Gibson, Cincinnati, Ohio	1913
Claypool Hotel, Indianapolis, Ind.	1914
Angel Guardian Orphanage, Chicago, Ill.	1915
Hotel Statler, Detroit, Mich.	1915
Hotel Blackhawk, Davenport, Iowa	1915
Canadian Pacific Railway Terminal Restaurant, Vancouver, B. C.	1915
Hotel Statler, St. Louis, Mo.	1917
Henry Ford Hospital, Detroit, Mich.	1917
Hotel Biltmore, New York, N. Y.	1917
Hotel Sisson, Chicago, Ill. (name now changed)	1918
Hotel Pennsylvania, New York, N. Y.	1918
Municipal Contagious Disease Hospital, Chicago, Ill.	1918

Products and Services

Everything in EQUIPMENT for the PREPARATION and SERVING of FOOD in Hotels, Restaurants, Clubs, Hospitals, Institutions, Cafeterias, School and Industrial Lunchrooms, Y. M. C. A.'s and similar establishments.

This includes all types of equipment for public service kitchens, cafeterias, coffee shops, lunchrooms and sandwich shops. Van equipment is all designed and built exclusively for public service use and is backed by over 75 years of experience in this field.

Architects, engineers or their clients, we believe, can profit by consulting us on the layout and construction of Kitchen, Cafeteria or Food Service Equipment.

Our many years of service in this field should merit your confidence in discussing your food problems with us.

Capable representatives are at your service.

planning for public and private schools, colleges and universities. \$0.50.

Practical Planning for Club Food Service—

A book of 32 pages covering the increasingly important subject of planning adequate food service for clubs, particularly country clubs. The proper handling of the country club kitchen both as to space and equipment is well covered in this book. \$0.50.

Practical Planning for Church Food Service—

Also a 32-page book which is the only reference material ever published on the subject of proper food service facilities for churches and community houses. \$0.50.

Hotel Planning and Outfitting—

This is an exhaustive textbook of 440 pages covering all phases of hotel planning and equipping. Contains hundreds of valuable plans, tables and illustrations. This book is sold at \$10.00 per copy, which barely covers the production cost of the book.

Main Kitchen of the Hotel New Yorker, New York, N. Y.
SUGARMAN & BERGER, Architects

Literature

In order to assist architects and their clients in the successful handling of food service problems, THE JOHN VAN RANGE COMPANY has published a special series of five books. Each of these covers fully the food service angle of one of the major divisions of the public service field and has been planned to be of particular value to architects. These are furnished at cost.

Planning Restaurants That Make Money—

An 80-page book devoted to the architectural and business problems which must be solved in regard to planning and outfitting all types of commercial restaurants. \$1.00.

Practical Planning for Hospital Food Service—

A 72-page book containing a full discussion of all phases of food service for hospitals and institutions including a careful analysis of different methods by which food service facilities of hospitals may be organized. \$1.00.

Practical Planning for School Food Service—

A 32-page book covering all angles of food service

Red Wheel Gas Ranges

Red Wheel Gas Ranges can now be used anywhere, because they not only burn gas as furnished in mains by gas companies but they also burn efficiently "Pyrofax gas," a natural gas compressed into tanks and delivered anywhere in the United States. (See Pyrofax Division pages.)

Other Products

AMERICAN STOVE COMPANY, largest makers of gas ranges in the world, also manufactures coal and wood stoves; oil cook stoves equipped with the Lorain high speed burner, and oil and gas water and room heaters.

The New Vogue in Gas Ranges

Magic Chef has been accepted everywhere as one of the finest, most modern cooking equipments of the day. This exclusive gas range is as efficient and durable as it is beautiful and pleasing in appearance. Both the Patrician and Jonquil models instantly win the heart of any woman, and transform the kitchen from a sombre place of utility alone to a delightful room which is the pride of the home manager. A Magic Chef, with the famous Red Wheel and its many desirable features, is often the means of deciding a home-seeker in favor of the house or apartment where it is installed.

This advanced example of stove building craftsmanship has been designated by authorities on interior decoration as the most outstanding achievement in style creation in the house furnishings field in a decade. Magic Chef, with its pleasing proportions, beauty of line and coloring, its durability and efficiency, is the ideal solution to the problem of making the kitchen attractive.

**Magic Chef—Jonquil Model**

Patents pending

Front panels and ends in old ivory with peacock green trim. Top in Italian grand antique marble finish

(1) "Patrician" model (shown on preceding page) has Italian grand antique marble finish with old ivory trim. Handles of onyx green bakelite. Also "Jonquil" model in old ivory with peacock green trim. All enamel (shown at left).

(2) The Magic Chef oven is equipped with the famous Lorain (Red Wheel) Oven Heat Regulator.

(3) Cooking-top cover spring-balanced, easy to operate. Unsightly utensils quickly covered.

(4) Magic Chef oven is insulated. Keeps kitchen cooler when baking.

(5) Pipes, gas valves and all bolts entirely concealed. All valves convertible by the turn of a screw into "safety" valves.

(6) Unique broiling feature includes an extension carriage that brings broiling pan into full view for the easy turning of meat. Reversible broiling pan requires no rack.

(7) Top burners of new, vertical injection type have removable non-corrosive heads. Each burner can be used as a simmering or a giant burner.

(8) Roomy service-drawer on rollers.

It Is
Gas Range
This Red

a "Good"
That Has
Wheel

To Architects and Builders

The Red Wheel is the identifying mark of the Lorain Oven Heat Regulator, a thermostatic device found on these famous makes of gas ranges, Clark Jewel, Direct Action, New Process, Quick Meal and Reliable, as well as Magic Chef. The Red Wheel, strongly endorsed by leading test kitchens and domestic science experts, automatically controls the heat of the gas range oven.

Gas ranges with the Red Wheel are everywhere recognized as the highest type of cooking appliances and continuous advertising in national magazines for over eleven years has made ranges with this time and labor saving device highly popular.

The following pages show only a few of the great number of sizes, styles and finishes of gas ranges manufactured by the AMERICAN STOVE COMPANY. Architects and builders are cordially invited to write for complete data on this extensive line.

The New Tiffin Model Is Ideally Suited to the Smaller Kitchen

For those who have been prevented from installing a Magic Chef because of size or price, the AMERICAN STOVE COMPANY has produced a more compact model of this famous gas range—the Tiffin. This

handsome, efficient, highly serviceable cooking appliance satisfies every requirement of those having a smaller kitchen, yet meets perfectly the maximum needs of the average family. The oven is large and roomy and the other features of this new gas range are equally attractive as those of its predecessor, Magic Chef. Modestly priced, but artistic and durable, the Tiffin, we believe, dominates the field of lower priced gas ranges.

No. 323, Angliron Custom-Built Range with Chromium Finish

This splendid, new gas range, with its mirror-like chromium finish, more closely resembles a classical work of art than it does the popular conception of a stove.

It is termed "custom-built" because it is handmade by trained craftsmen and produced to meet the demands

of the architect and owner who desire the finest obtainable in cooking equipment.

Many famous homes throughout the country have installed the No. 323, and in every case the owners are highly pleased with its perfect cooking qualities and exquisite appearance.

**These Angliron Custom-built Gas Ranges with Chromium Finish
Are Made to Order for Fine Homes**

AMERICAN STOVE COMPANY maintains a special department which is devoted to the creation of extra-fine gas ranges made to order for better class homes. These appliances completely fill the cooking demands of the large residence and keep the fur-

nishings in the kitchen in harmony with those in the rest of the house. The chromium finish is brilliant and sparkling at all times. It will not tarnish and mere wiping with a damp cloth keeps it spotless.

DETROIT-MICHIGAN STOVE COMPANY

GARLAND DIVISION

6900 East Jefferson Avenue, DETROIT, MICH.

Products

GARLAND GAS RANGES, OVENS, BROILERS and SALAMANDERS.

Description

Garland heavy duty cooking equipment for hotels, clubs, restaurants, hospitals, etc., possesses advantages and outstanding features that appeal to architects who specify for large buildings. The design, arrangement and the material used in Garland equipment have

contributed directly to their success, and the following description and specifications of each individual type will prove helpful in preparing kitchen layouts.

All Garland hotel equipment can be furnished in full monel finish with toncan oven linings.

We shall be pleased to co-operate with architects, and to give them every assistance in our power on any job on which they may be engaged. Catalogues, information, prices, etc., on request.

No. 45-26 Garland Hotel Range for Heavy Duty Work

Dimensions—Cooking top surface—34 in. wide, 40½ in. deep. Height to cooking top—33½ in. Oven—26 in. wide, 26 in. deep, 16 in. high.

Body—Body to be constructed of No. 16 gauge steel, reinforced with angle and band iron with ¾-in. air space insulation at sides and back. Legs, door frames and burners to be of cast iron.

Cooking Top—To be polished cast iron. Cooking top proper to be of heavy sectional cast iron key plates with two 10-in. covers.

Top Burners—To consist of 9 burners, each burner controlled by a separate brass gas cock fitted with adjustable orifice.

Burner Box—To contain a 2-in. layer of fire brick to deflect the heat to the underside of top. Burner box outlet to the exit flue to be entire width of range.

Heat Distribution of No. 45-26 Series

No. 45-26 Garland Hotel Range. All Hot Top

Oven—To be heated by 3 tubular burners, each controlled by a separate gas cock, burners removable through the front of range. Burners to be provided with pilot lighter which has drilled ports, lights from outside.

Oven to be equipped with one oven rack made of heavy angle and band iron; to have three slides so rack can be placed at different heights. Rack to be equipped so it will not tilt when pulled half way out.

Oven Bottom—Made of three thicknesses of heavy steel spaced from each other, upper sheet to be perforated on four edges to speed heat circulation, and to be removable without the use of tools.

Oven Door—To be of heavy cast iron and steel substantially braced and counterbalanced.

Extreme Bottom—To have openings for ventilation on four sides and to be insulated by two thicknesses of sheet steel with air space between.

Cooking Top 45-26 Series

Cooking Top Variations of the 45-26 Garland Hotel Range

No. 44-26 Garland Hotel Range with Open Top

Cooking Top—To be of three sections of open grids. The front top edge to extend over the top burner valves and burner air mixers, protecting them from grease drippings and breakage.

Top Burners—To consist of 6 Giant Star burners, each burner to be controlled by a separate cock fitted with adjustable orifice.

No. 48-26 Garland Hotel Range with Center Fire Top

Top Burners—To consist of 5 burners, each burner to be controlled by a separate brass cock fitted with an adjustable orifice. The flame to be baffled at the center of the key plates so as to spread the flame to the extreme sides.

No. 47-26 Garland Hotel Range with Solid Grid Top

Cooking Top—To be of one solid grid, extra heavy. Front top edge to extend over top burner valves and burner air mixers, protecting them from grease drippings and breakage. Front top edge to have a grease groove 2 in. wide of graduated depth and tapped at lower end for 1-in. pipe.

Top Burners—To consist of 3 double drilled bar burners, each burner to be controlled by a separate cock fitted with adjustable orifice.

No. 43-26 Garland Hotel Range with Grid Top and 2 Open Burners

Cooking Top—To be fitted with a griddle top 20½ in. wide, 27 in. deep, with grease groove on four sides and 2 Giant open burners. The front edge to extend over the top burner valves and burner air mixers, protecting them from grease drippings and breakage.

Top Burners—To be of 4 long bar burners under grid and 2 Giant open top burners, each burner to be controlled by separate cock, fitted with adjustable orifice.

No. 45-22 Garland Cafe Range with All-hot Top for Heavy Duty Work

Dimensions—Cooking top surface—29 in. wide, 32 in. deep. Height to cooking top—33½ in. Oven—22 in. wide, 24 in. deep, 14 in. high.

Body—To be constructed of 18 gauge steel. Legs, door frames and top of cast iron.

Cooking Top—To be of heavy cast iron frame and two sections of pan tops, fitted with 8-in. covers.

The front edge to extend over the top burner valves and air mixers, protecting them from grease drippings and breakage.

Top Burners—To consist of 5 bunsen burners each controlled by a separate cock fitted with adjustable orifice.

Burner Box—To contain a layer of fire brick to deflect the heat to cooking top.

Oven—To be heated by 2 tubular burners each controlled by a separate cock. Burners to be removable through front of range. Burners to be provided with a pilot lighter which lights from outside of oven.

Oven Bottom—To be of three thicknesses of heavy steel spaced from each other to prevent bottom burning food. Upper sheet to be perforated on four sides to speed heat circulation and bottom to be removable without the use of tools.

Extreme Bottom—To be made of three thicknesses of heavy steel with air spaces between.

No. 44-22 Garland Cafe Range with Open Top
Same dimensions as 45-22.**No. 44-22 Garland Cafe Range with Open Top**

Cooking Top—Frame to be of heavy cast iron with two sections of open grid.

Top Burners—To consist of 4 Giant Star burners, each burner to be controlled by a separate cock.

**No. 16-26 Salamander**

Fits Nos. 43, 44, 45, 47, 48 of No. 26 range series

No. 16-26 is 34¼ in. wide, 19 in. deep, 18 in. from top of range. Grid 30x16 in. Burners: 2 clusters of 4 each.

No. 14-22—Fits No. 45-22, No. 47-22 or No. 44-22 range.

No. 14-22 is 29x17 in. deep. Grid 21¼x14 in. deep. Burners: 2 clusters of 3 each.

Each cluster controlled by one cock at front end

No. 44-252-22 Garland Cafe Range

Dimensions—Cooking top surface—58 in. wide, 32 in. deep. Floor to cooking top—33½ in. Oven—22 in. wide, 24 in. deep, 14 in. high.

Body—To be constructed of 18 gauge steel. Legs, door frames and top of cast iron.

Cooking Top

—Frame to be of heavy cast iron with extra heavy open grids over burners.

Top Burners

To consist of 8 Giant Star open burners, each to be controlled by separate cock.

Burner Box

To be fitted with drip pans.

Oven

To be heated by 2 tubular burners each controlled by a separate cock. Burners to be removable through front of range. Burners to be provided with a pilot lighter which lights from outside the oven.

Oven Bottom—To be of three thicknesses of heavy steel spaced from each other to prevent bottom burning food. Upper sheet to be perforated on four sides to speed heat circulation and bottom to be removable without the use of tools.

Extreme Bottom—To be made of three thicknesses of heavy steel with air spaces between.

**No. 44-252-22 Garland Cafe Range****No. 1332 Restaurant Range**

Dimensions—Cooking top 74 in. wide, 28½ in. deep. Floor to cooking top—34½ in. Ovens—22 in. wide, 20 in. deep, 14 in. high.

Body—To be of 20 gauge steel with cast iron oven front. Mounted on heavy base frame reinforced with angle iron.

Cooking Top—Frame to be of heavy cast iron with extra heavy open grids over 8 burners and polished cast iron griddle 20 in. wide. When so specified, griddle 9¼ or 31 in. wide can be furnished. Also obtainable with 12 open top burners.

**No. 1332 Restaurant Range**

Two ovens, single deck high shelf, 8 open top burners and 20-in. griddle. Can also be furnished in single section with 6 open top burners

Top Burners—4 Giant and 3 regular Star open top burners and 2 loop burners beneath griddle. Each burner separately controlled by cock.

Burner Box—To be fitted with drip pans.

Ovens—Two ovens, each heated by 2 tubular burners, each controlled by a separate cock. Burners to be removable through front of range and to be lighted by outside pilot lighter.

No. 630 Garland Broiler and Roaster

Dimensions—Extreme width 30 in.; 34 in. deep. Height 67½ in. Broiler Grid 23½ in. wide, 23½ in. deep. Oven 22 in. wide, 24 in. deep, 14 in. high. Heated by broiler burners. Has 2-in. thick brick between bottom and burners.

Body—To be of 16 gauge range steel, reinforced with band and angle iron. All operating parts in front.

Burners—6 double drilled tubular, divided in clusters of 3 each. Each cluster controlled by one large cock. All burners removable for cleaning.

Broiler Grid—Extra heavy, controlled by a lever which locks at position wanted. Has forward extension of 10 in. Fitted with large grease pan

No. 12-54 Double Garland Broiler and Roaster

Dimensions—Extreme width, 54 in.; 34 in. deep, 67½ in. high. Broiler grid 48 in. wide, 23½ in. deep. Ovens, each, 22 in. wide, 24 in. deep, 14 in. high.

Body—To be of 16 gauge range steel. Extra heavy cast iron parts, all operating parts placed in front.

Burners—12 double drilled tubular, divided in clusters of 6, each cluster controlled by one large cock. All removable for cleaning without the use of tools.

Broiler Grid—Extra heavy, controlled by lever which locks at position wanted. Has forward extension of 10 in. Fitted with hopper grease pan.

Ovens—Each heated by 6 burners. Oven has 2-in. thick fire brick bottom which absorbs and reflects the heat to the grid

No. 18-36 Garland Broiler, Toaster and Griddle

Dimensions—Griddle top 36 in. long, 18¾ in. wide. Broiler grid 30 in. long, 16 in. wide. Extreme length 39 in., extreme height 42 in.

Body—Heavy steel, cast iron top.

Burners—8 burners in clusters of 4. Each cluster controlled by one large cock.

Grid Control—Lock lever at end.

Griddle Top—To be of heavy polished cast iron, fitted with grease groove on four sides. Space between griddle and burners filled with fire brick to retain and radiate heat

No. 13-24 Garland Broiler, Toaster and Griddle with Adjustable Grid

Dimensions—Griddle top 18 in. wide, 26 in. deep. Broiler grid 13 in. wide, 24 in. deep. Extreme height 39¼ in., extreme width 19 in., extreme depth 29¼ in.

Body—Heavy gauge blued range steel.

Burners—3 tubular burners, each controlled by separate valve.

Grid Control—Lock lever at side. Permits raising or lowering of grid to suit operator.

Griddle Top—Heavy polished cast iron, fitted with grease groove on four sides. Drilled for grease drain connection

No. 24-24 Garland Griddle

Dimensions—Griddle 24 in. wide, 24 in. deep. Warming shelf below burners 21½ in. wide, 23½ in. deep with a 6-in. clearance from burners. Storage compartment 21½ in. wide, 23½ in. deep, 11½ in. high. Over-all width 24 in., depth 27 in., height 33¼ in.

Body—Heavy gauge blued steel with 1¼-in. angle iron legs.

Burners—4 tubular cast iron burners, each controlled by separate valve.

Griddle Top—Heavy polished cast iron with ½-in. raised edge

No. 2-26 Garland Roasting Oven

Construction—Made in units of 2 and 4 ovens.

Dimensions—No. 2-26—Width 31 in., depth 34½ in., height 53½ in. Ovens each 26 in. wide, 26 in. deep, 16 in. high.

Dimensions—No. 4-26—Width 62 in., depth 34½ in., height 53½ in. Ovens each 26 in. wide, 26 in. deep, 16 in. high.

Ovens—Controlled by 3 burners under each oven. Burners to be removable through front. Each oven fitted with a drilled pilot lighter, lighted from the outside. Oven bottoms to be of three thicknesses of steel with air spaces between instead of insulation. Oven bottoms to be perforated with rows of holes on four sides to speed circulation. Air inlet for upper oven to be taken from rear.

Main Bottom—To be of three thicknesses of heavy steel with air spaces between

Products

HOTPOINT ELECTRIC RANGES for residences and apartments. Furnished in many sizes and designs to meet varied demands. Architects' hand book on request.

Also manufacturers of "Hotpoint" Electric Household Appliances.

For Edison Electric Commercial Cooking and Baking Equipment, Hotpoint Electric Water Heaters and Electric Air Heaters, see Manufacturers' Index.

Distinctive Features

Cleanliness—Electric cookery has no flame, consequently no soot. Reduces decorating expense.

Patented Calrod Units—Consist of a helical coil of CALROD, cast within a smooth top solid metal plate, thus the coil is protected against oxidation and physical abuse.

Open Coil Surface Units—The glowing, radiant, instant heat type set in heater brick of special high temperature, heat retaining porcelain. Interchangeable with CALROD units.

Hi-Speed Calrod Surface Unit—Heats approximately 20% faster than any other surface unit of any construction of the same wattage. Heavy knife blade terminals. Interchangeable with any Hotpoint open coil or standard CALROD surface units. Watts, 1200-600-300.

Interchangeable Surface Units—Surface units can be placed in any hole of the same size in the cooking tops regardless of the unit wattage. Affords "custom built" ranges to suit individual needs.

Welded Connections—Welded connections on Hotpoint units eliminate six trouble points in each unit.

Safety Plugs—All wire attachment to units are made inside heavy shockproof plugs.

White Porcelain Enameled Cooking Tops—Easy to

A GENERAL  ELECTRIC
ORGANIZATION

Hotpoint

clean as a china plate. All corners carefully rounded to eliminate dirt accumulation.

Precision Temperature Control and Thermometer—Maintains and indicates oven temperatures with remarkable accuracy due to extreme sensitiveness and location.

Reversible Switches—A Hotpoint convenience.

Pressed Steel Parts Throughout—All important parts are of heavy pressed steel—strong, accurate and highly finished.

Outline and Dimensions of RA34

Model RA65

Dimensions — Floor space 45 1/4 x 26 7/8 in.; height over all 40 3/8 in.; cooking top 23 x 24 1/2 in.; 32 1/2 in. from floor; oven 16 in. wide x 14 in. high x 19 in. deep

Model RA34

One of the 15 standard models

Models R112 and R113

Adaptation—Specially designed for apartment kitchenettes. These ranges furnished without legs as standard equipment for built-in kitchen cabinet installation. Legs (black or white) furnished at additional cost.

Oven—14 in. wide, 14 in. high, 15 in. deep.

Unit Equipment—R112—One interchangeable $6\frac{1}{2}$ -in. surface unit, 1000-500-250 watts, either CALROD or open coil. One interchangeable $8\frac{3}{4}$ -in. surface unit, 2000-1000-500 watts, CALROD or open coil. Two interchangeable oven units (upper and lower) each 1100-550-275 watts, open coil type.

R113—Two interchangeable $6\frac{1}{2}$ -in. surface units, 1000-500-250 watts, CALROD or open coil. One interchangeable $8\frac{3}{4}$ -in. surface unit, 2000-1000-500 watts, CALROD or open coil. Two interchangeable oven units (upper and lower) each 1100-550-275 watts, open coil type.

Model R112 As a Built-in Installation

TECHNICAL INFORMATION

Underwriters' Laboratories' Approval

All Hotpoint ranges are listed as standard by the Underwriters' Laboratories, Inc.

Built-in Units

Frequently Hotpoint ranges are built into the cabinets in kitchenettes. Fire risk inspectors have in several cases authorized complete enclosure as the temperature of the exposed surfaces is so low as to make even metal linings unnecessary. Ranges will be furnished without legs when intended for use with Kab-bases, or special cabinets.

Wiring for Hotpoint Ranges

Each range must be supplied through a separate branch circuit. (Rule 1602-c—1925 N.E.C.) This should preferably be a 110-220-volt, 3-wire circuit. The circuit to each range must be controlled by an accessible indicating switch. The service switch may be used for this purpose. In the Multi-Family dwelling, a switch should be in the apartment, or on the same floor of the apartment in which the range is installed and may control the lights and other appliances. (1928 N.E.C. Rule 1603) (A-3). This switch does not need to be within sight of the range. If the range connection is made with a three-wire plug and receptacle, the requirement of this switch is generally waived.

When only single conductor, single braid, solid wire is used, the following conduit sizes may be used (Rule 503m—1925 N.E.C.):

- 3—No. 12 wires in $\frac{1}{2}$ -in. conduit
- 3—No. 10 wires in $\frac{3}{4}$ -in. conduit (standard)
- 3—No. 8 wires in $\frac{3}{4}$ -in. conduit
- 3—No. 6 wires in 1-in. conduit (recently approved)

Demand factor. Electric ranges seldom are used at their full name plate rating. Many city electrical inspection codes allow the use of a demand factor in determining the size of service wires, switchboards and feeders supplying electric ranges.

RANGE LOADS

Number of Ranges	
1 to 2	100%
3	85%
4	65%
5	52%
6	40%
7	30%

For safety reasons it is essential that all range frames be thoroughly grounded. A ground connection to the conduit supplying the range is considered satisfactory.

The various heating units in electric ranges are not required to be separately fused. (Rule 1605-d—N.E.C. 1928.) The larger Hotpoint ranges have individual fuses for convenience.

Metering

In many cities a low wholesale rate for electric service makes it desirable for the apartment owner to purchase all of the power for lighting, ranges, elevators, etc., though one meter and include the cost of power for cooking in the rent. In other cities a low rate for cooking is available to individual small customers which make it desirable for each apartment to be separately metered, particularly as lighting and cooking power is generally supplied through the same meters, and each tenant thus assumes the operating cost.

Power Demand and Consumption

The National Electric Light Association has recently completed a very complete study of the load characteristics of groups of electric ranges. Demand—for ranges in detached houses with an average nameplate rating of 6.44 kw., the maximum demand per range was found to be as follows:

Number of range customers	Average maximum demand per range
1	3.61 kw.
5	1.75
10	1.36
20	1.13
40	1.00
80	.89
150	.86

Tests made in six apartment buildings in Seattle totaling 284 ranges showed a maximum demand of .87 kw. per range.

Kilowatt-Hour Consumption

The average power used by an electric range installed in homes has been found to be very closely 1500 kilowatt-hours per year. The N.E.L.A. report shows an average of 1424 kilowatt-hours per year for the homes that were studied. Of course, wide variations from this are to be expected.

Separately metered three and four-room apartments show a substantially lower consumption. Six apartment buildings in Seattle were carefully checked and an average consumption of 90 kilowatt-hours per apartment per month was found. Other tests indicate an average consumption per apartment of 80 to 100 kilowatt-hours per month.

ELECTROMASTER INC.

Manufacturers of the Electrochef Range

FACTORY AND GENERAL OFFICES

1803 East Atwater Street, DETROIT, MICH.

Product

ELECTROCHEF ELECTRIC RANGE for residences and apartments; standard finish white porcelain.

Distinctive Features

A new economical modern electric stove combining all the advantages of electric cooking with many distinctive features heretofore unknown in electric ranges.

Interchangeable Surface Units—All four burners are of the same size and capacity. They may be changed by the housewife and washed in the dishpan if necessary.

They draw 1300 watts on high heat; 650 watts on medium; and 325 watts on low.

Porcelain Enamel Through-out—The entire exterior of the range is white porcelain. Easy to clean as a china plate.

Round Corners—All corners are rounded preventing dirt accumulation.

Crevices are eliminated.

Chromium Plate—The reflectors under the surface units and the interior of the oven are heavily plated with chromium to prevent rust and insure efficient reflection of heat.

New Heat Principle—Heat is transferred to the food by radiation and convection.

Pressed Steel—All major parts are drawn from armco iron and are finished in white porcelain or chromium plate.

The manufacturer will gladly furnish information

The Electrochef Range

regarding apartment house model occupying floor space 22x24 in., with the oven beneath the cooking table, or the Master Model having 6 burners and 2 ovens, overall width 71 in.

Electrical Characteristics

Maximum amperage (all elements on), 31.3 amperes.

Table element watts on low, 325 watts; medium, 650 watts; high, 1300 watts.

Oven element watts (one element, one switch position, automatic control), 2000 watts.

Total wattage (115/230 volts) including convenience outlet, 7900 watts.

Electrochef should be fused at 35 amperes. Specify A. C. or D. C.

Specifications

Dimensions and weights of Model "B."

Overall height	47½"
Overall width	40½"
Overall depth	25½"
Cooking table size	22½" x 22½"
Cooking table height from floor	31"
Diameter of cooking table unit	6½"
Oven interior height (above element)	11½"
Oven interior height (grilling space)	3¼"
Oven interior width (rack to rack)	13"
Oven interior depth	19"
Total net weight	180 lb.
Shipping weight crated	240 lb.
Dimensions of crate	49½" high x 44½" wide x 28¾" deep
Weight of table element	10 oz.
Weight of oven element	2 lb. 13 oz.

Roughing-in Dimensions of the Electrochef Range

**Smoothtop No. E18ET**

Full enamel finish insulated or non-insulated, supplied also in color, semi-enamel and standard finishes. Closed top heated by two-speed burners in front and one junior burner in rear. Entire top is cooking area, having four cooking zones, duplex oven and broiler of large capacity

No. E18ET
Oven,
18x19x14 in.
For complete dimensions of range see table below

No. E12-16ET
Oven,
16x19x13 in.
Broiler,
10x19x13 in.

**Smoothtop No. E12-16ET**

Full enamel finish, supplied also in semi-enamel finish. Closed top heated by three-speed burners in front and one junior in rear. Entire top is cooking area having four cooking zones—speed, moderate, simmering and warming. Large oven and separate broiler. Exceedingly compact and moderately priced

Vulcan Heavy Duty All Hot Top Ranges, Bake Ovens and Other Gas Appliances

There is a Vulcan Gas Appliance for every cooking need—in hotels, restaurants, clubs, schools, hospitals, factories, any place where large quantity cooking is done—only a few numbers of which are shown here.

Ask for our descriptive catalogue.

Vulcan All Hot Top Ranges—Are equipped with a patented four-ring burner. All four rings are lighted to heat food quickly, then one or two rings keep food cooking. Every square inch of closed top heated (by one burner) giving maximum capacity in minimum space.

No. 3751 Hotel Range with High Shelf

A Combination of Vulcan Ranges and Spreader Plate

7½ ft. of working surface consisting of two No. 3751 ranges, one 30½-in. spreader plate, two No. 784 high shelves and one No. 3787 salamander broiler

Combination of Various Types of Vulcan Restaurant Gas Ranges

Smaller in size, but constructed upon the same principle as the heavy duty ranges. Restaurants, smaller hotels, hospitals, large private homes and hundreds of other requirements are being satisfactorily served by these ranges

Vulcan ranges have a proven record of a saving of gas consumption of 25%.

Two types can be supplied—heavy type for the big hotel, restaurant and hospital, and a similar design smaller in size.

Furnished with closed or open top, can be connected together like sectional bookcases, in any combination to meet every cooking need.

On this page are shown several of the innumerable combinations of Vulcan ranges.

Attachments—Broilers and high shelves, which are interchangeable, are furnished as required.

Vulcan Bake Ovens—The new Vulcan Insulated Bake Oven with heat control meets the needs of hotels, restaurants, bakeries, clubs and institutions for an oven that will turn out a wide variety of baked products of superior quality. Walls of ovens are insulated to prevent loss of heat, making for economy and improving working conditions. Better cooking results are assured because of even distribution of heat throughout oven. A new feature is the automatic heat control which maintains any temperature desired without attention. It is easy to operate, simple in construction, and extremely accurate. Sturdy construction of oven assures many years of satisfactory service.

Vulcan Bake Oven

Two sizes: No. 3761 has a capacity of 48 1-lb. loaves bread or 24 10-in. pies. No. 3762 has a capacity of 96 1-lb. loaves bread or 48 10-in. pies

Cooking Planning Service

Experts with many years' experience in planning the cooking equipment for thousands of kitchens will be glad to assist you in selecting the types and sizes of equipment best suited to the job in hand.

Use this service when a client is considering equipping a new kitchen or renovating one now in use.

Three Vulcan No. 3751 Ranges

30½-in. spreader plate and Vulcan No. 3756 broiler. Space required 12 ft. 8½ in.

Three Vulcan No. 3751 Ranges

Two 20-in. spreader plates with salamander and high shelves. 10 ft. 11½ in. of cooking surface

Two Vulcan No. 3751 Ranges

No. 3752 skeleton cooking top, two 10-in. spreader plates and No. 3756 Vulcan broiler connected in combination. Space required 11 ft. 10 in.

Three Vulcan No. 3751 Ranges

Salamander broiler, two 20-in. spreader plates, one connected between range and broiler

Typical Combinations of Vulcan Hotel Ranges

WESTINGHOUSE ELECTRIC & MFG. CO.

EAST PITTSBURGH, PA.

For Branch Offices, see our Lighting Catalogue
For References to Other Products, see Index to Manufacturers

Hotel Type Broilers

Built to withstand constant hard service, and in design incorporates features that insure convenience of operation and low operating cost. Broiler is made in two sizes, each of which is supplied complete with an insulated au gratin oven permanently placed above the broiling area. Heat from the broiler, which would otherwise be wasted, is used in heating this oven.

Large Broiler with Roasting Oven

The broiling grid, which is counterbalanced, is manipulated by a convenient handle and can be adjusted by the operator's arm, thus leaving the hands free to place the food to be broiled directly on the broiling grid.

The large broiler is supplied with a roasting oven identical to that in the hotel range which gives the user increased roasting facilities with no increase in floor space.

BROILER SPECIFICATIONS

	Style No. 220-v.	Kw.	Floor space, in.		Over-all ht., in.	Approx. wt., lb.	
			Wide	Deep		Net	Ship.
Large broiler with roasting oven	449552	18	44½	39	70	1630	1755
Small broiler	449553	8	30½	39	70	1000	1080

	Large broiler dimensions, in.			Small broiler dimensions, in.		
	Wide	Deep	High	Wide	Deep	High
Broiler grid area	33	24		23	24	
Capacity, steaks per hr.	72 pounds			48 pounds		
Chickens (broilers), per hr.	54 pounds			36 pounds		
Warming oven, dimensions	31	22	12	21	22	12
Roasting oven, dimensions	22	28	15	Not	supplied.	
Roasting oven meat capacity	50 pounds					

Voltage—220 a-c. or d-c. and 110 special.
Control—Three-heat reciprocating switches.
Finish—Standard, black japan with polished steel trim. Special, as required.

Electric Griddles

Unusually attractive appearance, economical, convenient, extremely sturdy, and especially adapted for the quick service of steak, chops, eggs, bacon or hot cakes.

Electric Griddle

These electric griddles are suitable both for heavy duty continuous service and also for the intermittent operation in hotel, restaurant or lunchroom where they may be used to keep food hot until required.

They are made in two sizes. The body is made of heavy sheet steel, well braced on the inside. The feet are of cast iron. The legs and switch box are black japanned and the body is polished nickelplate.

The griddles have cast iron tops with a deep grease groove around the outside edge. A hole is provided in this groove for a pipe drain.

COMMERCIAL COOKING

The 20-in. griddle has one heater. The 38-in. has two heaters each covering one-half of the top area. Heaters are controlled by a three-heat, reciprocating snap switch giving full, one-half and one-quarter heat.

GRIDDLE SPECIFICATIONS

Kw.	Style Nos.		Dimensions, in.			Approx. wt., lb.	
	110-v.	220-v.	Length	Depth	Height	Net	Ship.
3	497829	497830	20	20	9½	80	110
6	497831	497832	38	20	9½	139	175

Commercial Type Ranges

The Westinghouse 3-ft. and 4-ft. section commercial type ranges are built to withstand the heavy service found in hotel, restaurant, cafeteria and institution kitchen operation.

Framework of ranges is heavy structural steel. Cooking surface consists of cooking plates surrounded by a belt of brushed steel trim. Heating elements are embedded in the heavy cast iron plates. Corrox construction, in such a way that they are completely protected, insuring high efficiency and long life. The 4-ft. section has 4 plates, 3-ft. section 2 plates, each being controlled by separate 3-heat snap switch.

Hotel Type Range

Ovens, supported by the framework, consist of an inner and outer shell of rust-resisting steel. Oven of the 4-ft. section is lined with stainless steel and the 3-ft. section is vitreous enamel lined; both are heavily insulated with mineral wool.

Oven can be supplied with either non-automatic or automatic temperature control. All switches and fuses, kept cool by air circulation, are mounted directly on the ranges. Range fronts are protected by guard rails.

The Westinghouse Range will do more work than a fuel range of the same size, thus saving labor and floor space.

SPECIFICATIONS

Description	Style No. 220-V.	Dimensions, in.			Kw.	Approximate weight, lb.	
		Width	Depth	Height		Net	Ship.
3-ft. section range							
Automatic	595111	36	30	31	11.6	600	630

Cooking Surface—3-ft. section: 24 in. wide, 18 in. deep; 2 cast iron plates each 12x18 in.; total 8 kw. 4-ft. section: 36 in. wide, 24 in. deep; 4 cast iron plates each 12x18 in.; total 18 kw.

Roasting Oven—3-ft. section: 18 in. wide, 17½ in. deep, 15 in. high total 3.6 kw. 4-ft. section: 22 in. wide, 28 in. deep, 16 in. high; total 6 kw.

Voltage—220 volts a-c. or d-c. (specify in case of automatic); 110-volt special.

Control—Three-heat reciprocating switches for cooking surface. Automatic or non-automatic temperature controlled oven.

Finish—Black japanned body, brushed steel top trim, special as required.

Sectional Bake Ovens

Have many features which bakeries, hotels, ships and institutions readily realize. The ovens are of the hearth type built in sections, each section having independent heat control; thus products requiring different baking temperatures may be baked in adjacent sections at the same time. All ovens are supplied with either automatic or non-automatic temperature control. In non-automatic controlled oven temperature is regulated by three-heat reciprocating switches. In automatic oven temperature is maintained automatically at any desired point by a thermostat and mercury switch.

Sectional Ovens can be easily installed in basements or second story locations where it would be inconvenient or unsafe to install a large heavy oven because separate sections can be carried through a small door.

**Two-section
Bake Oven,
No. 662820**

40-loaf sections,

Sectional Roasting Ovens

Made in capacities to meet all requirements from the small restaurant to the largest hotels or cafeterias.

These ovens will pay for themselves in a short length of time due to reduced shrinkage of meats. Improved flavor and reduced spoilage are other important features.

Three sizes of roasting ovens are listed, each of one or two-section capacity. These are complete ovens. In addition the meat roasting section only (with tile hearth) is described. With this information the dimensions and other information on combination ovens can be secured by referring to this data and like description of the corresponding bake oven.

Complete roasting ovens	Style No. 220 volts, 1-ph., 60-cy., automatic	Capacity, lbs.	Floor space, in.		Ht. over all, in.	Ht. to hearth, in.		Kw.	Approx. wt., lb.

Hearth area: 60 lb.—19x28½ in. 125 lb.—38x28½ in. 250 lb.—38x58 in.
Inside height, all sizes: 12¾ in.
Finish and control: Same as other ovens.

Electric Coffee Urns

The Westinghouse Electric Coffee Urn is a combination hot water and coffee urn consisting of two compartments, one for hot water and one for coffee. The urn is simple in operation and foolproof in construction. Coffee cannot be made in the urn until the water boils and this boiling water is quickly sprayed over the grounds and automatically repoured with cover closed, thus retaining all the delicate aroma and flavor.

The urn body is made of very heavy copper, nickel-plated and polished, and the coffee container is of heat-resisting glass in the smaller sizes; rustproof metal in the 8 and 10-gal. sizes. An air space between the coffee container and the inner shell keeps the coffee at proper temperature, preventing cooling or boiling. The urns of the 4-gal. and smaller sizes have one coffee faucet and one hot water faucet. The larger urns have two coffee faucets and one hot water faucet. The urn is provided with efficient and durable immersion heaters controlled by a three-heat rotary switch. The Westinghouse Urn has a special combination safety and water relief valve to prevent any possible collapse or bursting from pressure through careless handling.

ELECTRIC RANGES

Westinghouse uses the Old Dutch Oven principle for the operation of its Flavor Zone Ranges. They are the only ranges that make it possible to duplicate the best results of any other cooking method without any one being in the kitchen during the browning and roasting process. A lining of enameled sheet steel is placed inside the outer oven walls and a high grade heat insulator (mineral wool) packed between lining and walls. The same procedure is followed in the oven door, so that, when closed, heat is retained in the oven long after the current has been turned off. The use of this principle has many advantages: economy of current consumption from the use of stored heat; food left in the oven longer than necessary is never overdone or burned, but kept hot and palatable; complicated method of control not necessary to maintain a cooking temperature in the oven.

New Quick-Cook Unit

Improved Clock—An important improvement in the appearance of the Westinghouse ranges has been brought about by redesigning the clock which automatically turns on the oven heat at the desired time. New modernistic lines make this clock an object of beauty, quite apart from its very utilitarian purpose in the range.

Ovens—Furnished right or left-hand.

**Junior Console 43**

Description—Kitchenette for 5 or 6 people.

Dimensions in Inches—Overall, 35½ wide, 43½ high, 24½ deep. Oven, 14 wide, 14 high, 17½ deep. Cooking platform, 18 wide, 21¼ deep, 32 from floor. Wiring outlet, from floor 25; from oven end 9½.

Finish—Gray enamel and black japan.

Units—Surface, open or enclosed; 6 in., 1200 watts; 8 in., 1500 watts and 2250 watts. Oven: top, 1500 watts; bottom, 1500 watts. Appliance receptacle, 660 watts—not used on non-automatic.

Operation—Automatic or non-automatic. Automatic oven controlled by thermometer.

**Low Oven Range**

Description—Small kitchenette.

Dimensions in Inches—Overall, 20½ wide, 38¼ high, 21 deep. Oven, 16½ wide, 13½ high, 12 deep. Cooking platform, 19¾ wide, 17½ deep, 35 from floor. Wiring outlet, from floor 28½; from oven end 5¾.

Finish—Gray enamel and black japan.

Units—Surface, open or enclosed; 6 in., 1200 watts; 8 in., 2250 watts. Oven: top, 1500 watts; bottom, 1500 watts. Appliance receptacle, 660 watts.

Operation—Automatic or non-automatic. Automatic oven controlled by thermometer.

High Oven Range

Description—Small apartment kitchen.

Dimensions in Inches—Overall, 20½ wide, 62¼ high, 24 deep. Oven, 16½ wide, 13½ high, 12 deep. Cooking platform, 19¾ wide, 23 deep, 32 from floor. Wiring outlet, from floor 25; from oven end 9½.

Finish—Gray enamel or black japan.

Units—Surface, open or enclosed; two 6 in., 1000 watts; one 8 in. (hot spot), 1500 watts. Oven: top, 1500 watts. Appliance receptacle, 660 watts.

Operation—Automatic or non-automatic. Automatic oven controlled by thermometer.

The Console 43

Description—Small kitchen.

Dimensions in Inches—Overall, 40½ wide, 49¾ (43½ non-automatic) high, 27 deep. Oven, 14 wide, 14 high, 17½ deep. Cooking platform, 23 wide, 24½ deep. Wiring outlet, from floor 25; from oven end 12½.

Finish—(Non-automatic is in gray only and has no appliance receptacle.) Gray, semi-white or green enamel.

Units—Surface, open or enclosed; 6 in., 1200 watts; 8 in. (hot spot), 1500 watts; 8 in., 2250 watts. Oven: top, 1500 watts; bottom, 1500 watts. Appliance receptacle, 660 watts.

Operation—Full automatic oven controlled by clock and thermometer. Automatic by thermometer.

**Console 63**

Description—Bigger family.

Dimensions in Inches—Overall, 43 wide, 51¼ (full automatic) 45 automatic high, 27 deep. Oven, 16 wide, 14 high, 17½ deep. Cooking platform, 23 wide, 24½ deep, 32 from floor. Wiring outlet, from floor 25; from oven end 12½.

Finish—Gray, green or semi-white.

Units—Surface, open or enclosed; 6 in., 1200 watts; 8 in. (hot spot), 1500 watts; 8 in., 2250 watts. Oven: top, 1500 watts; bottom, 1500 watts. Appliance receptacle, 660 watts.

Operation—Full automatic or automatic. Full automatic oven controlled by clock and thermometer, automatic oven controlled by thermometer.

Console 83

Description—Small or medium size kitchen.

Dimensions in Inches—Overall, 45½ wide, 51¼ (full automatic) 45 (automatic) high, 27 deep. Oven, 18 wide, 15 high, 17½ deep. Cooking platform, 23 wide, 24¼ deep, 32 from floor. Wiring outlet, from floor 25; from oven end 12½.

Finish—Gray, green or semi-white.

Units—Surface, open or enclosed; 6 in., 1200 watts; 8 in. (hot spot), 1500 watts; 8 in., 2250 watts. Oven: top, 1800 watts; bottom, 1800 watts. Appliance receptacle, 660 watts.

Operation—Full automatic or automatic.

Console 84

Description—For family of 8 or 10.

Dimensions in Inches—Overall, 48½ wide, 51¼ high, 27 deep. Oven, 18 wide, 15 high, 17½ deep. Cooking platform, 26 wide, 24¼ deep, 32 from floor. Wiring outlet, from floor 25; from oven end 13½.

Finish—Gray, green or semi-white.

Units—Surface, open or enclosed; 6 in., 1200 watts; 8 in., 1000 watts; 8 in. (hot spot), 1500 watts; 8 in., 2250 watts. Oven: top, 1800 watts; bottom, 1800 watts. Appliance receptacle, 660 watts.

Operation—Full automatic (oven controlled by clock and thermometer).

**Console Fuel 83**

Description—For small, medium sized kitchens.

Dimensions in Inches—Overall, 59 wide, 54 high, 32½ deep. Oven, 18 wide, 15 high, 17½ deep. Cooking platform, 36½ wide, 24 deep, 34¼ from floor. Fire box, 13½ wide, 18 long, 8¼ deep. Wiring outlet, from floor 27¼; from oven end 25¼; fire box 13½ wide, 18 long, 8½ deep.

Finish—Gray enamel or semi-white.

Units—Surface, open or enclosed; 6 in., 1200 watts; 8 in. (hot spot), 1500 watts; 8 in., 2250 watts. Oven: top, 1800 watts; bottom, 1800 watts. Appliance receptacle, 660 watts.

Operation—Full automatic.

**Royale 841 with Lowboy**

Description—More than 6 people (small clubs).

Dimensions in Inches—Overall, 48½ wide, 54¼ high, 27 deep. Oven, 18 wide, 15 high, 17½ deep. Cooking platform, 26 wide, 24 deep. Warming compartment, 17½ wide, 18 deep, 5¼ high. Wiring outlet, from floor 25; from oven end 13½.

Finish—Gray enamel and chromium plate.

Units—Surface, open or Corox enclosed; 6 in., 1200 watts; 8 in., 1500 watts; 8 in. (hot spot), 2250 watts. Oven: top, 1800 watts; bottom, 1800 watts. Appliance receptacle, 660 watts.

Operation—Full automatic, (oven controlled by clock and thermometer).

**Royale 431**

Description—5 or 6 people.

Dimensions in Inches—Overall, 40½ wide, 53¼ high, 27 deep. Oven, 14 wide, 14 high, 17½ deep. Cooking platform, 23 wide, 24¼ deep, 32 from floor. Wiring outlet, from floor 25; from oven end 12½.

Finish—Gray enamel and chromium plate.

Units—Surface, open or enclosed; 6 in., 1200 watts; 8 in. (hot spot), 1500 watts; 8 in., 2250 watts. Oven: top, 1500 watts; bottom, 1500 watts. Appliance receptacles, 660 watts.

Operation—Full automatic (oven controlled by clock and thermometer).

Console Fuel 43

Description—For family of 5 or 6 people.

Dimensions in Inches—Overall, 53¼ wide, 52½ high, 32½ deep. Oven, 14 wide, 14 high, 17½ deep. Cooking platform, 36½ wide, 24¼ deep, 34¼ from floor. Fire box, 13½ wide, 18 long, 8¼ deep. Wiring outlet, from floor, 27¼; from oven end 25¼.

Finish—Semi-white or gray enamel.

Units—Surface, open or enclosed; 6 in., 1200 watts; 8 in. (hot spot), 1500 watts; 8 in., 2250 watts. Oven: top, 1500 watts; bottom, 1500 watts. Appliance receptacle, 660 watts.

Operation—Full automatic.

**Junior Console D 43**

Description—Apartment or home kitchen for 5 or 6 people.

Dimensions in Inches—Overall, 38½ wide, 47 high, 27½ deep. Oven, 14 wide, 14 high, 17½ deep. Wiring outlet, from floor 24; from oven end 9½.

Finish—Gray enamel.

Units—Surface, open Quick-Cook; 6 in., 1000 watts; 8 in. (hot spot), 1500 watts; bottom, 1500 watts; appliance receptacle, 600 watts.

Operation—Full automatic, automatic, non-automatic.

Console D 63

Description—For the bigger family.

Dimensions in Inches—Overall, 40½ wide, 47 high, 27½ deep. Oven, 16 wide, 14 high, 17½ deep. Wiring outlet, from floor 25, from oven end 12½.

Finish—Gray enamel.

Units—Surface, open Quick-Cook or enclosed; 6 in., 1000 watts; 8 in. (hot spot), 1500 watts; 8 in., 2000 watts. Oven: top, 1500 watts; bottom, 1500 watts. Appliance receptacle, 660 watts.

Operation—Full automatic or automatic.

**Console D 83**

Description—For small or medium sized kitchens.

Dimensions in Inches—Overall, 43½ wide, 48 high, 27½ deep. Oven, 18 wide, 15 high, 17½ deep. Wiring outlet, from floor 24; from oven end 9½.

Finish—Gray enamel.

Units—Surface, open Quick-Cook; 6 in., 1000 watts; 8 in. (hot spot) 1500 watts; 8 in., 2000 watts. Oven: top, 1800 watts; bottom, 1800 watts; appliance receptacle, 660 watts.

Operation—Full automatic or automatic.

**Senior Console D 84**

Description—8 or 10 people (small clubs and the like).

Dimensions in Inches—Overall, 47 wide, 48 high, 27½ deep. Oven, 18 wide, 15 high, 17½ deep. Wiring outlet, from floor 24; from oven end 11½.

Finish—Gray enamel.

Units—Surface, open Quick-Cook; 6 in., 1000 watts; 8 in., 1000 watts; 8 in. (hot spot), 1500 watts; 8 in., 2000 watts.

COLT'S PATENT FIRE ARMS MANUFACTURING CO.

DALLAS, TEX., Milam Hotel

Colt Autosan Dishwashers

A dishwashing machine, whether for a large hotel or small lunchroom, must stand up under hard service, be foolproof, wash delicate china and glassware quickly, thoroughly and safely, and be economical—a real money and time saver. Colt Autosans completely fill all these requirements.

Construction—Of copper (or monel metal), brass and bronze, with the micrometer accuracy that fine firearms require, means long life and low "upkeep" cost.

Economical—Many leading hotels, restaurants, clubs, hos-

COLT AUTOSAN

DISH AND SILVER CLEANING MACHINES

pitals and institutions have reduced their dishwashing costs 25% to 50% by installing Colt Autosans. They are built in eight models—a model for every dishwashing need.

Guarantee—Autosans are a typical Colt product in all that the name implies. They are backed by the character, reputation and guarantee of one of America's oldest, largest and most responsible manufacturers.

Catalogues—Write for new Architects' Portfolio containing illustrated catalogues, prices, drawings, specifications and detailed information on the various models.

Model "C-3" Conveyor Type

For heavy duty. The largest Autosan made. It has maximum capacity, speed and efficiency. For big hotels, clubs, restaurants and hospitals it (1) washes, (2) rewashes, (3) rinses and (4) sterilizes all tableware quickly, safely and economically for upward of 2000 persons per meal.

Model "C-22" Conveyor Type

For large volume work. Mechanically like Model "C-3," embodying the same labor saving features, but with two tanks instead of three, hence occupying less floor space and with somewhat less capacity. 1200 to 2000 persons per meal, cafeteria service.

Model "C-2"—Identical to Model "C-22," except with conveyor 17 in. wide instead of 22 in. 1000 to 1500 persons.

Model "RA-1" Automatic Rack Conveyor Type

The machine for kitchens with much work and little space. Racks of tableware are carried on roller chain conveyor through a battery of washing cataracts—on through another battery of rinsing sprays to the receiving table, insuring fast, dependable turnover from soiled to clean dishes with minimum care and attention.

Model "RM-1," Manual Rack Type—Same as Model "RA-1" without roller chain conveyor. Racks of tableware are manually put through machine on special rollers.

Model "B" Rotary

A compact, simple, sturdy dishwasher that is ideal for hotels, clubs, restaurants and hospitals of average size. Operates on the rotary conveyor principle which gives large capacity with extreme economy of floor space and remarkable ease of operation and saving of labor. Will wash tableware for 1000 persons, cafeteria service, per meal. Standard machines equipped for heating by steam. Gas attachment furnished at same price or combination steam and gas at slight additional cost.

Model "A-2" Rotary

For small restaurants. Similar to Model "B" but smaller. Occupies about the space of an armchair. Will handle tableware for up to 600 persons per meal or will wash 4000 glasses per hour. Used by small hotels, clubs, lunchrooms and hospitals. Standard machine equipped for heating by steam. Gas attachment furnished at same price or combination steam and gas at slight additional price.

Model "S-1" Rack Type

A rack-type Autosan of unique design and with many practical features for ultimate efficiency. Ideal for small restaurants and hospitals. Interlocking fixed sprays secure maximum cleanliness in washing and rinsing tableware. Standard machine equipped for heating by steam. Gas attachment furnished at same price, or combination steam and gas at slight additional price.

CRESCENT WASHING MACHINE DIVISION OF THE HOBART MANUFACTURING CO.

Manufacturers of Electric Dishwashers and Glasswashers
TROY, OHIO

NEW YORK OFFICE, 40 East 22nd Street

CHICAGO OFFICE, 308 West Randolph Street

SALES AND SERVICE REPRESENTATIVES IN ALL PRINCIPAL CITIES

Crescent Electric Dishwashers and Glasswashers

For hotels, restaurants, hospitals, schools, institutions, cafeterias, lunch-rooms, clubs, soda fountains, etc. Made in eight sizes, ranging from the small Model SM to Model FF with a capacity of 18,000 dishes per hour.

All models are extremely compact, durable and neat in appearance. They may be obtained in 16-gauge Monel metal, 48-oz. copper or 12-gauge galvanized iron. The three larger models are completely automatic.

Simplicity of Operation

No experience is necessary to get perfect results from a Crescent.

The tableware is simply placed in racks—open at top and bottom—which hold the dishes steady and safe and which allow the water to reach every surface. The racks are then placed in the machine which practically does the rest.

Crescent Patented Revolving Wash

Only on a Crescent will you find the patented revolving wash. The rack of dishes slides between two sets of wash arms—one above and the other below the dishes. Powerful jets of hot wash water are discharged from wide nozzles in these arms as they revolve. The whirling streams quickly strip and scrub away every trace of grease and food particles, without injuring the most delicate china.

Sterilizing Rinse

Each rackful of dishes gets a shower of clean, scalding hot water straight from the boiler. Patented rinse sprayers, located above and below the dishes, distribute the water with the greatest effectiveness and economy.

Retained heat dries the dishes within a few seconds after they leave the machine. Toweling is the task of a second or two, and the tableware is immediately ready for service again—clean—sparkling—sterilized.

Installation

All Crescents are shipped completely assembled. Power and plumbing connections are all that are necessary to make the machine ready for use. Installing a Crescent is just as simple as installing a sink.

Details in Architects' Data Book, which we will be pleased to send on request.

AUDIFFREN-SINGRUN ICE MACHINE.
AUDIFFREN DRINKING WATER SYSTEMS.
AUDIFFREN REFRIGERATING SYSTEMS.
AUDIFFREN ROOM COOLING SYSTEMS.

The Audiffren Machine

Description—The Audiffren machine is so designed that the mechanism, the refrigerant—sulphur dioxide—and the lubricating oil are permanently and hermetically sealed inside the dumb-bell shaped rotor.

There are no external glands, valves or gauges. There is nothing to adjust or to set, no gas can leak out and no recharging of refrigerant is ever needed. To produce refrigeration, the dumb-bell must only be rotated, with the condenser end dipping in a tank of cooling water, the evaporator end in the liquid to be cooled.

Advantages—The Audiffren machine is safe. Its design inherently provides for that, and it can be installed anywhere without risk to life or property. There is no fire hazard. The refrigerant is not inflammable. The working pressure is low and excessive pressures can not be generated under any condition of operation or abuse. (Explained in our Bulletin M-105.) Machine refrigerates by simply *rotating the rotor*. It is economical to operate, simple, durable. Satisfaction is permanent.

Sizes—Built in actual capacities of $\frac{1}{5}$ to 6 tons, these machines provide ideal service at low cost with absolute safety, and no skilled supervision.

Application—The Audiffren machine is particularly adapted to direct cooling of drinking water in factories, public buildings and hotels—a single unit serves from 50 to 3000 persons. For the highest grade of refrigerating service and ice making in large private homes, hospitals and institutions, the Audiffren machine is a standard by which refrigerating performance has been judged for many years. This standard is now available for room cooling.

Performance—The Audiffren machine may be operated by belt drive from any available source of power. With electric power it lends itself readily to automatic control and requires only routine attention. When used for refrigeration of *storage boxes* and *cold rooms*, brine is maintained at low temperature in the

Rand Tower, Minneapolis, Minn.

HOLABIRD & ROOT,
Architects
Equipped with Audiffren
Drinking Water System

insulated brine tank (in which ice may be made if desired) and circulated through the cooling coils of the refrigerator.

When refrigerating *drinking water*, no brine is used and the rotor turns directly in the water. The motion of the dumb-bell both cools the water and aerates it in an insulated, covered tank. This feature provides complete accessibility for easily cleaning the tank at regular intervals.

A circulating system is always used. The *auto-circulator* eliminates the pump in certain applications. The Audiffren machine, serving aerated water with a circulating system, provides an unequalled quality of service.

For *room cooling*, similar equipment is used. The cold water is circulated to each room, where an Audiffren unit cooler with its thermostatically controlled fan, cools the air in the room to the proper degree, removes excess humidity, and keeps the air in motion.

Facilities—Audiffren rotors are standard and have been built and perfected in the United States since 1911. Capacities vary with operating conditions, and full information concerning the application is requested from the architect, with whom we are prepared to co-operate at every stage of his project.

Products

AUTOMATICALLY CONTROLLED REFRIGERATING, ICE MAKING PLANTS and DRINKING WATER SYSTEMS; AUTOMATIC INDIVIDUAL ROOM CONTROL.

"Automatic" Refrigerating Systems

Installations are designed to suit the purchaser's requirements as to type and arrangement of the "Automatic" equipment furnished.

Make use of our engineering service and obtain the best possible system for your individual needs.

Operation—By means of the "Automatic" Refrigerating System any number of cold storage rooms can each be held at different temperatures automatically and connected to the same refrigerating machine.

The system is particularly adapted for installations where there is a wide difference of temperature in the various rooms, or where there is an extreme fluctuation of refrigeration demand. It is also possible, where a large number of small boxes are to be cooled, to group them so as to feed several boxes on one circuit. With this arrangement of individual control for each box or groups of boxes, a refrigerating plant can be made completely "Automatic" for any kind of service.

TRADE-MARK
Reg. U. S. Pat. Off.

"Automatic" Liquid Ammonia Valves

One of these valves placed in the liquid line will shut off the liquid supply when the machine is shut down, either through the thermostat or failure of power. The valve can be operated directly from a thermostat for individual room control.

Thermostatic Expansion Valve

This valve can be used to good advantage either on a refrigerating plant with a single circuit, or in parallel circuits using any number of these valves. The amount of ammonia fed to the expansion coils is controlled by a thermostatic chamber placed in the outlet from the last coil fed by the valve. This type of expansion valve maintains the frost on all of the piping to which it is connected within a few feet of the thermostatic chamber. This means maximum efficiency and minimum operating cost.

Back Pressure Regulator

The back pressure regulator is connected to the suction line of the refrigerating machine. This regulator is set to shut down the machine at the highest suction pressure possible and obtain the desired temperatures in the boxes. This eliminates the additional expense involved in producing refrigeration at low suction pressures.

Products and Services

REFRIGERATING MACHINES (Carbon Dioxide Compression, Ammonia Compression and Exhaust Steam Absorption Systems); PARAFFIN WAX MACHINERY consisting of Distillate Chilling Machines, Hydraulic Filter Presses, Pumping Equipment, Sweating Pans, etc.

Manufacturers of Ice Making Plants; Low and Intermediate Pressure Raw Water Systems; Evaporator Systems; Steam and Power Aqua Ammonia Pumps; Ammonia Economizers; Brine Coolers; Ammonia Fittings; Liquid Carbonic Acid Gas Plants.

We are prepared not only to furnish these machines but to DESIGN and INSTALL COMPLETE PLANTS.

Compression Refrigerating Systems

Carbondale compression machines are built in the vertical enclosed types up to 50 tons capacity. The horizontal double acting type is built from 16 to 700 tons capacity in single units. The larger units utilize the two-stage principle with water and ammonia intercooling, which greatly increases the efficiency of the unit.

Carbondale carbon dioxide compression machines are used in connection with air conditioning of theatres and public buildings.

The Carbondale ammonia compression system uses the Worthington Feather Valve (Reg. U. S. Pat. Off.) compressor, assuring quiet and efficient operation. We are prepared to furnish Feather Valve ammonia compressors in the following combinations: vertical, enclosed single acting; single and double cylinder, belt driven; horizontal duplex and two-stage, direct connected to electric motor. Single and duplex, steam driven, using direct connected slide valve, or Stumpf unafrow engines.

Absorption Refrigerating Machine

Where large quantities of low pressure steam are available, the absorption refrigerating machine, operating as a by-product apparatus, will deliver refrigeration at a very low cost.

There are no heavy moving parts, and operation is noiseless. Heavy foundations are eliminated. It requires very little attention, and is adaptable to any floor space or headroom.

Application

Carbondale Ice Making and Refrigerating Machinery is performance-proved in practically every industry requiring refrigeration. Moreover the line is so broad and modern that the correct type of machine, to meet local conditions, is always assured.

Bulletins, giving more complete data and descriptions of various Carbondale machines are available.

Petroleum Refinery Equipment

The Carbondale chilling machine offers the best method of cooling both medium and zero cold test oils.

The Carbondale filter press, having flexible plates, is especially adapted for filtering under high pressure, such as the separation of paraffin wax from petroleum distillate and carbon from coal tar.

Carbondale Service

We maintain a staff of engineers experienced in the design of Carbondale machinery and conversant with refrigeration work. They are competent to plan installations to meet individual requirements. Their services are freely offered to engineers, architects and purchasers.

Products and Application

REFRIGERATING and ICE-MAKING MACHINERY, using either ammonia or carbon-dioxide, for all commercial purposes, plants of all sizes and types, with automatic or hand control—Drinking Water Systems, Air Cooling, Cold Storages, Ice-making Equipment, Condensers, Brine Coolers, Coils, Valves, Fittings, and all plant parts.

Description

Frick machines are built in sizes from $\frac{1}{2}$ to 650 tons refrigerating capacity, including four sizes of combined units. The drive can be through belt, or with direct-connected motor, or with steam, gas or oil engine.

Frick Carbon-dioxide Enclosed Compressors are designed to utilize the advantages of this gas but avoid the usual operating difficulties. Extra long pistons extend into the crankcase, where they provide a crosshead effect, on suitable guides. Heating of suction gas eliminated. Forked connecting rods engage pin on both sides of piston. Shaft stuffing box has metallic packing, oil-sealed. Automatic,

Sectional View Frick Carbon-dioxide Compressor

Frick Carbon-dioxide Compressor

Frick Type J Horizontal Compressor

Frick Enclosed Ammonia Compressor

force-feed lubrication throughout. Roller thrust bearing. Single or dual effect compression, to suit requirements. Great capacity with less horsepower. Installed in prominent hospitals, theaters, and other public buildings.

Special Features

Special features of Frick Enclosed Ammonia Compressors include water jackets over the cylinder heads; plate valves; simple, full size by-pass; automatic lubrication (force-feed for larger sizes); double length stuffing box with spring lantern; die-cast, renewable bearings; outboard bearing beyond fly-wheel; and many others. Frick Horizontal Compressors afford large capacity where space and headroom are limited.

Small Combined Refrigerating Machine with Direct-connected Motor

Service

Stocks of Frick machines and refrigerating equipment are carried by distributors everywhere. Both branch offices and distributors offer complete engineering service, including layout, specifications, drawings, sales, manufacture, installation, test, and maintenance. Nearly 50 years' refrigerating experience is built into Frick equipment.

Products

ICE MAKING and REFRIGERATING MACHINERY: Ammonia Compressors of Compression Type (Vertical, Horizontal, Two-stage, Double Suction, Multiple Effect).

Complete equipment for ice plants, cold storages and cooling equipment for any refrigerating job. Ammonia condensers and brine coolers of vertical or horizontal single and multi-pass atmospheric, double pipe. Ammonia valves and fittings, receivers, ammonia pumps, aqua ammonia pumps, regenerators, separators, automatic expansion valves, coils and pipe fabrications, oil coolers, oil separators, scale traps and all refrigerating machinery accessories.

Description

All above equipment, complete in every detail, made at our own factories. Compression systems only, but use ammonia, carbon dioxide or methyl chloride gas.

Sizes

Ammonia compressors, vertical type, 1 to 60 tons. Horizontal (medium or high speed), 12 tons to any size.

Application

All refrigerating equipment designed especially to meet conditions of any particular job. The self-contained units used for small dairies, butcher shops; also for water cooling in office buildings, apartments, etc. Vertical and horizontal compressors can be used on any type of refrigerating job, the style and size depending upon location, capacity and requirements.

Service

A large engineering corps, long experienced in design and equipment of every type installation, helps you plan your own or your client's plant. International organization assures prompt service on parts, repairs, etc.

Engineering Co-operation

Vilter Engineers are always ready to work with users or prospective users of refrigeration; with architects, engineers and others engaged in building or remodeling plants using the various types of refrigeration.

*Designates stock points.

Literature

Address the Home Office regarding any refrigeration problem. Bulletins, catalogs and other reports covering all subjects, gratis.

Self-contained Unit

One to six tons. No special foundation necessary. Unit consists of compressor, high side connections, condenser, motor, and full automatic control equipment.

Vertical Compressors

From 4½x4½ in. through the 10½x10½ in. ranging from 6 to 60 tons.

Medium Sized Compressors

Twelve tons to any size.

Two-stage Compressors

For any low temperature work or booster machines if present ammonia compressors are to be operated at very low temperatures.

Condensers

Horizontal or vertical single pass shell and tube, horizontal multi-pass double pipe and atmospheric.

FULL AUTOMATIC (AMMONIA) COMPRESSION REFRIGERATING MACHINES, including Compressors, Condensers, Valves, Fittings, Coils, Cabinets, Water Coolers, etc.

Application

Lipman machines deliver dependable, economical refrigeration for every type of commercial or industrial installation. They function with equal efficiency on direct expansion or brine circulating systems. Typical installations include creameries, apartments, hospitals, schools, hotels, ice cream factories, and drinking water cooling systems for public buildings, institutions, and industrial plants.

Sizes

Self-contained, full automatic machines are built

in capacities ranging from 1/4 to 5 tons daily refrigeration. Vertical compressors, with individual capacities of 7 1/2, 10, 15, and 20 tons, are equipped with either automatic or manual controls.

Service

Each Lipman branch and distributing organization has a competent refrigeration engineer as its directing head. These men are specialists in the design and layout of refrigerating systems to fit any commercial or industrial requirement. Design and layout for replacement installations is another service which is given by Lipman engineers free of charge.

Complete personal information and additional information in the form of booklets and catalogues is always readily available for the mere asking. Submit your refrigeration problems to Lipman for quick and satisfactory solutions.

Lipman Refrigerating Machine, 1/2 to 1 1/2 Hp.

Self-Contained Models

The Lipman Model at the left is built in five sizes, ranging from 1/2 to 1 1/2 hp., while the model below is built in six sizes, from 2 to 10 hp. All eleven models are fully automatic and fully self-contained.

Lipman Refrigerating Machine, 2 to 10 Hp.

Lipman Compressor

Other Lipman Models

The Lipman Compressor above is built in the 15, 20, 30, and 40 hp. sizes.

Compressor, motor, and condenser are mounted separately, but may be assembled very compactly and operated fully automatic.

Manual control is optional.

Ice Making and Refrigerating Machinery

The York Full Automatic Self-contained Refrigerating Unit
Obtainable in capacities up to 8 tons

sizes and types from 1½ to 600 tons refrigerating capacities. Ammonia absorption and carbon dioxide compression machinery of any capacity required by trade.

Application—York Refrigerating Machines are adapted for use in all industries where low temperatures are required, the type of machine being determined, to a great extent, by local conditions. York engineers are thoroughly familiar with all types of local conditions,

Description — We make, in our own factory, all the machinery and apparatus used in ice making and for general refrigeration by means of compression systems of the ammonia and carbon dioxide types and ammonia absorption systems. Compressors may be actuated by any available power.

Sizes—Ammonia compressors are built in various

6x6 In. to 12½x14½ In. York Enclosed Ammonia Compressor

having had long experience with ice plant and refrigerating installations in every part of the country.

This valuable experience, together with York Service, York Equipment and York Supplies are at your command by communicating with the nearest of our conveniently located direct factory branches.

Coil Type Air Conditioner

A self-contained unit for cooling air by means of water, brine, carbon dioxide, methyl chloride or ammonia. Coil design insures maximum efficiency. Low speed fans designed for quiet operation. All parts galvanized. Exterior casing lacquered finish. Adapted to thermostatic control, with defrosting feature.

Coil Type Air Conditioner

Spray Type Air Conditioner

Complete self-contained air conditioning unit requiring minimum space and including air washer with refrigerating coil, air heating coils, fan and motor, pump and motor and temperature and humidity control, all assembled as a single unit.

Yorkco Cold Storage Doors

The design, insulation, and construction of these doors incorporate several exclusive Yorkco features which make for the greatest possible efficiency and permanence.

On the standard cooler door, a panel of corkboard placed across the top of the door extends down 6 in. into the granulated cork. This eliminates any loss of insulation through settling of the cork. An extra heavy steel angle reinforcement is screwed into each of the four corners. Superior diagonal bracing adds to the rigidity of the door. Only carefully selected, well-seasoned woods are used; and all hardware is Yorkco designed and built.

Yorkco packing assures delivery in perfect condition. There is a Yorkco cold storage door for every cold storage need.

Yorkco Super Freezer Door

FEDERAL METAL PRODUCTS CORPORATION

Manufacturers of Electric Refrigerators, Cabinets and Compressors

FACTORY AND GENERAL OFFICES

HOBOKEN, N. J.

NEW YORK OFFICE: 40 East 49th Street

Products

FEDERAL FRIGERATORS are made in all the popular styles and sizes employed in domestic household electric refrigeration. Three sizes of compressor units are available, which together with five varieties of cooling units, comprise a range of cabinets from 4 to 16 cu. ft. net capacity.

logue.) This company has offices in principal cities and maintains a large staff of engineers and draftsmen who co-operate with architects in designing special jobs involving kitchen cabinets and refrigeration. The combined facilities of both companies are at your service for the asking.

Advantages

The models shown here are typical of the choice available for apartment house installations. They may be had in all-porcelain outside and inside, or in Duco lacquer outside and enamel interior. Practically any budget allowance can be fitted to one of the many Federal models according to the quality of cabinet desired.

Federal Frigerator's line of cabinets includes single and double door models, cork or dry zero insulation, cabinets with electric lighting, cabinets with ice-water coolers and many other refinements.

The Company and Service

FEDERAL METAL PRODUCTS CORPORATION is affiliated with the "White" Door Bed Company, 40 East 49th Street, New York, N. Y., specialists in space-saving conveniences. (See their pages in this Cata-

Compressor

Regardless of the cabinet selected, Federal Frigerators are all equipped with an over-powered compressor, designed to make ice quickly on the hottest days at a minimum of current consumption. Specifications will be furnished on request to show that the Federal compressor in every Federal Frigerator is larger in stroke and bore, and therefore greater in efficiency than compressors used in the average cabinet of similar cubic capacity.

The Federal compressor has a comfortable margin of efficiency—

it is large enough, powerful enough to do all the freezing that will be called for and 20% more. It is quiet-running and compact, equipped with one of the finest motors made and delivers high compression at low speed. Federal Frigerator makes ice with "Artic" (methyl chloride) the modern refrigerant. Unlike sulphur dioxide, which is still used in many of the older refrigerators, Artic is non-toxic, odorless and quick freezing.

Model I L 462

Model I L 462

Food Storage Capacity: 4.05 cu. ft.
Shelf Area: 8.25 sq. ft.
Exterior Dimensions: 24 in. wide, 20½ in. deep, 53 in. high.
Insulation: 2 in. Dry Zero—highest efficiency known.
No. of Trays: 2, for making ice or frozen desserts.
Ice Making: No. 228 Evaporator; 56 good size cubes; 4 lbs. ice at one freezing.
Cabinet: exterior, baked enamel on steel; interior, Porcelain-on-steel lining.

Model I L 563

Food Storage Capacity: 5.04 cu. ft.
Shelf Area: 9.25 sq. ft.
Exterior Dimensions: 26½ in. wide, 20½ in. deep, 52 in. high.
Insulation: 2 in. Dry Zero—highest efficiency known.
No. of Trays: 3, for making ice or frozen desserts. Removable shelf, permitting use of one double-depth tray.
Ice Making: No. 328 Evaporator; 84 good size cubes; 6 lbs. ice at one freezing.
Cabinet: exterior, baked enamel on steel; interior, Porcelain-on-steel lining.

FRIGIDAIRE CORPORATION

SUBSIDIARY OF GENERAL MOTORS CORPORATION

Manufacturers of Refrigerators and Refrigerating Equipment

DAYTON, OHIO

Backed by a Definite Guarantee

With more than a million and a half Frigidaires installed in homes, stores, apartments and every kind of business in every part of the world, FRIGIDAIRE CORPORATION offers to the architect a complete line of time-tested equipment backed by wide experience and outstanding success in the refrigeration field. Architects have the assurance moreover that every Frigidaire product they specify is backed by a definite guarantee on the part of Frigidaire and General Motors. And what is more important, they also have the assurance that in future years, Frigidaire will continue to give reliable, economical refrigeration—long after the guarantee has expired.

Architects Can Choose from This Comprehensive List

Standard household refrigerators.

Special low price refrigerators: (1) for unit installations; (2) for multiple installation.

Water coolers individual type: (1) for bottled water; (2) pressure type water cooling systems for office buildings, factories, etc.

Ice cream cabinets: small portable models; large standard models.

Combination ice cream and bottled beverage cabinets.

Room coolers.

Individual cooling coils and compressors for practically any need.

Advantages of Frigidaire for the Home or Apartment

(1) Frigidaire offers the architect the choice between unit installations and multiple installations. This gives him utmost freedom in specifying exactly the right type and amount of refrigeration to serve his client's interests best.

(2) Frigidaire offers the widest selection of models to suit the size and cost of the building—the tastes and pocketbook of clients.

(3) Frigidaire makes it possible for the architect to include water coolers and other refrigeration equipment as a part of a comprehensive refrigeration plan. In many cases, such equipment as a water cooler may be refrigerated by the same mechanical unit as the refrigerator.

(4) Frigidaire offers the architect the economies and convenience of the "Unit System" of refrigeration whereby several groups of two or more refrigerators may be operated independently of one another.

FRIGIDAIRE

The Ten-Point Household Frigidaire

In the standard household line of Frigidaires, architects will find a combination of features which assures him of providing the best for his clients by specifying Frigidaire.

- (1) A cabinet of Porcelain-on-steel, combining durability, beauty and sanitation of porcelain with the strength of steel.
- (2) Beauty—of finish, line and color.
- (3) Quickube Ice Tray—a new patented type of tray that will appeal to clients because it releases ice cubes instantly—all at once, or one at a time.
- (4) The famous Frigidaire "Cold Control" which enables the user to make scores of delicious new salads and desserts.
- (5) The Hydrator which makes even wilted vegetables crisp and fresh.
- (6) Elevated food shelves, up where they are easy to reach.
- (7) Quiet starting, running and stopping.
- (8) Surplus power that will keep foods safely cold, even in the hottest weather.
- (9) Freezing unit—which permits extremely low temperatures for fast freezing.
- (10) Low operating cost—just a few cents a day.

Special Models in Glacier-Gray Porcelain-on-Steel

The following features apply specifically to the new line of Frigidaire models in gray Porcelain-on-steel (see page 4).

- (1) Cabinet of symmetrical design; smooth, unbroken lines; harmonious to any kitchen scheme. Porcelain-on-steel inside and out.
- (2) Accessible "Cold Control" for special fast freezing of ice and desserts on all unit installations.
- (3) Flat top providing additional kitchen shelf space.
- (4) Softly rounded corners and edges; nothing to catch dirt or dust.
- (5) Heavily nickelplated hardware of exclusive design.
- (6) In self-contained models, all mechanism concealed beneath cabinet, elevating shelves to convenient height.
- (7) Cam roller-bearing latch insures positive door seal.
- (8) Doors sealed against leakage by cushion gaskets.
- (9) Doors perfectly balanced for easy opening and closing.
- (10) One-piece, seamless Porcelain-on-steel interior for durability and sanitation. Rounded corners for easy cleaning.
- (11) Shelves scientifically spaced.
- (12) Shelves made of heavy drawn steel, rustproof and non-corrosive.
- (13) Hardwood door sills of natural finish prevent condensation of moisture.
- (14) Cabinet inner and outer casings are of highest quality pressed steel, reinforced with hard, dry wood frame as in the finest automobile body construction. Prevents vibration or sagging.
- (15) Totally enclosed freezing compartment prevents absorption of food odors by ice cubes or desserts.
- (16) Each freezing tray is sealed in its individual sleeve for fast freezing.
- (17) The combination finned-tube construction of the cooling unit provides maximum cooling surface in a minimum of space required.
- (18) Cold air circulation insured by large surface area and design of cooling unit. This means rapid cooling, non-fluctuating temperature and low operating costs.

Two Typical Methods of Installing Frigidaire

Above: A self-contained unit-type installation with the compressor concealed at the bottom of the cabinet.

Right: Remote type of installation which becomes the multiple type, when more than one cabinet is refrigerated by one compressor (see page 5). When this latter system is used, the space below the shelves may be used for storage purposes.

FRIGIDAIRE HOUSEHOLD CABINETS

"Cold Control"

Just as different degrees of heat are required in cooking, so also are different degrees of cold required in the most satisfactory freezing of desserts and salads. The Frigidaire Cold Control enables the user to tap and control Frigidaire's reserve power for this purpose and for unusually fast freezings of ice cubes. It is a feature architects will find pleases clients and users and is standard equipment on all Frigidaire models for unit installations. It is located at convenient hand height, on the exterior of the refrigerator.

air compartment scientifically placed and ventilated to keep lettuce, parsley, tomatoes, peppers and other salad materials in a fresh crisp condition.

Patented Quickube Ice Tray

Another feature specially developed by General Motors for Frigidaire is the patented "Quickube Ice Tray" which releases ice cubes instantly—one at a time or all at once. Architects specifying Frigidaire household models will find clients and users appreciate the convenience provided by this mark of progressive refrigeration in the kitchen.

**Hydrator**

The Hydrator is another piece of standard equipment on household models which architects have found very popular with clients and users. This simple device, developed by Frigidaire, provides a moist cold

Legs Optional Equipment

Where built-in installations are not made, it sometimes happens that clients prefer refrigerators up on legs. Frigidaire household models may be obtained with legs if so desired at no extra expense.

Frigidaire Is Ideally Suited to Fit into Architects Designs

The illustrations at right show how easy and convenient it is for architects to fit Frigidaire cabinets into various kitchen plans. Because of their symmetri-

cal design, with top and other exterior surfaces flat and smooth, Frigidaire cabinets can be adapted to practically any kitchen size or arrangement. They may be placed underneath shelves, and in many other niches where they will be both a convenience and a space saver. Moreover, because Frigidaire cabinets are adaptable for both unit and multiple installations, they afford the architect an even greater degree of freedom in his refrigeration plans.

FRIGIDAIRE STANDARD HOUSEHOLD CABINETS

Frigidaire standard household cabinets are available in seven different models varying in size from 18 to 4 cu. ft. storage capacity. All are finished inside and out in enduring Porcelain-on-steel. All have the Hydrator, the accessible Cold Control, and the new Quickube patented freezing tray which releases ice cubes instantly—one at a time or all at once. Legs are standard equipment on the two smaller models and may be obtained as optional equipment on the others which have roller bearing casters as standard equipment. Exteriors are of a pleasing Tu-Tone, gray and white, which

blends with any color or plan of room decoration.

In checking capacities on these and other Frigidaire models the architects will find it worthwhile to note that the figures are in *net cubic feet* of storage capacity. Food storage area, in *square feet* is also given, but this figure will vary for any given volume depending on the number of shelves and the distance between.

All models are available for unit installation only except the Model AP-18 which is designed for installation of the compressor away from the cabinet in some convenient location.

**Model AP-18 Specifications
(Remote Installations)**

Food storage capacity: 18 cu. ft.
Food storage area: 27 sq. ft.
Dimensions: for complete dimensions see Page 2.
Ice making: No. 60-TF coil, 6 trays, 144 cubes, 20 1/4 lbs. of ice.
Compressor for remote installation: Model AW or K.
Cabinet: interior; one-piece, seamless Porcelain-on-steel lining.
Exterior: light gray and white Tu-Tone semi-flexible Porcelain-on-steel.
This cabinet requires installation of compressor in place other than base of cabinet.

**Model AP-7-5 Specifications
(For Unit Installations)**

Food storage capacity: 7 1/2 cu. ft.
Food storage area: 12 sq. ft.
Dimensions: for complete dimensions see Page 2.
Ice making: No. 6-TF coil, 3 trays, 54 cubes, 7 1/2 lb. of ice.
Compressor for unit installation: Model A.
Cabinet: interior; one-piece, seamless Porcelain-on-steel lining.
Exterior: light gray and white Tu-Tone semi-flexible Porcelain-on-steel.

**Model AP-12 Specifications
(For Unit Installations)**

Food storage capacity: 12 cu. ft.
Food storage area: 20 sq. ft.
Dimensions: for complete dimensions see Page 2.
Ice making: No. 59-TF coil, 4 trays, 96 cubes, 13 1/2 lb. of ice.
Compressor for unit installation: Model A or AW.
Cabinet: interior; one-piece, seamless Porcelain-on-steel lining.
Exterior: light gray and white Tu-Tone semi-flexible Porcelain-on-steel.

**Model AP-4 Specifications
(For Unit Installations)**

Food storage capacity: 4 cu. ft.
Food storage area: 8 sq. ft.
Dimensions: for complete dimensions see Page 2.
Ice making: No. 110-TF coil, 2 trays, 24 cubes, 2 1/2 lb. of ice.
Compressor for unit installation: Model FAH.
Cabinet: interior; one-piece, Porcelain-on-steel. Bright metal, self-sealing tray fronts.
Exterior: light gray and white Tu-Tone semi-flexible Porcelain-on-steel.

**Model AP-6 Specifications
(For Unit Installations)**

Food storage capacity: 6 cu. ft.
Food storage area: 9 sq. ft.
Dimensions: for complete dimensions see Page 2.
Ice making: 115-TF coil, 2 trays, 42 cubes, 6 lb. of ice.
Compressor for unit installation: Model F.
Cabinet: interior; one-piece, seamless Porcelain-on-steel lining.
Exterior: light gray and white Tu-Tone semi-flexible Porcelain-on-steel.

**Model AP-9 Specifications
(For Unit Installations)**

Food storage capacity: 9 cu. ft.
Food storage area: 15 sq. ft.
Dimensions: for complete dimensions see Page 2.
Ice making: No. 10-TF coil, 4 trays, 72 cubes, 10 lb. of ice.
Compressor for unit installation: Model A.
Cabinet: interior; one-piece, seamless Porcelain-on-steel lining.
Exterior: light gray and white Tu-Tone semi-flexible Porcelain-on-steel.

**Model AP-5 Specifications
(For Unit Installations)**

Food storage capacity: 5 cu. ft.
Food storage area: 8 sq. ft.
Dimensions: for complete dimensions see Page 2.
Ice making: No. 115-TF coil, 2 trays, 42 cubes, 6 lb. of ice.
Compressor for unit installation: Model F.
Cabinet: interior; one-piece Porcelain-on-steel lining.
Exterior: light gray and white Tu-Tone semi-flexible Porcelain-on-steel.

FRIGIDAIRE MULTI-COLD CABINETS

Architects wishing to specify the finest type of "De Luxe" refrigeration for clients will find their requirements met fully by the new Frigidaire Multi-Cold Refrigerators. These two new models offer five different kinds of refrigeration—extreme cold, cold storage, moderate cold, moist cold, and dry cold—all within the same cabinet. Both have the sturdy cabinet construction, the porcelain-on-steel finish and other desirable features of the standard line.

The Multi-Cold Frigidaire— Model MC-9

Food storage capacity: food compartment, 6 $\frac{3}{4}$ cu. ft. Hydrator compartment, 1 $\frac{1}{4}$ pks. Frozen products, 7-lb. fowl. Bottle storage, 4 quart milk bottles.

Food storage area: food compartment, 14 $\frac{3}{4}$ sq. ft.

Exterior dimensions: 37 $\frac{1}{4}$ in. wide, 28 in. deep, 67 $\frac{3}{4}$ in. high. (Depth includes 2 in. at rear for ventilation, but does not include doors or hardware.)

Number of trays: 3, for making ice or frozen desserts.

Ice making: with No. 13-TF coil, 96 cubes, 10 lb. of ice at one freezing.

Cabinet: exterior, Tu-Tone, Porcelain-on-steel.

Interior, one-piece seamless Porcelain-on-steel lining. Complete with "Frigidaire Cold Control," Frigidaire hydrators, and Quickcube tray.

Specifications

The Multi-Cold Frigidaire— Model MC-12

Food storage capacity: food compartment, over 8 cu. ft. Hydrator compartment, 1 $\frac{1}{4}$ pks. Frozen products, 7-lb. fowl. Bottle storage, 8 quart milk bottles.

Food storage area: food compartment, 18 sq. ft.

Exterior dimensions: 46 $\frac{1}{2}$ in. wide, 28 in. deep, 67 $\frac{3}{4}$ in. high. (Depth includes 2 in. at rear for ventilation, but does not include doors or hardware.)

Number of trays: 5, for making ice or frozen desserts.

Ice making: with No. 51-TF coil, 120 cubes, 17 lb. of ice at one freezing.

Cabinet: exterior, Tu-Tone, Porcelain-on-steel.

Interior, one-piece seamless Porcelain-on-steel lining. Complete with "Frigidaire Cold Control," Frigidaire hydrators, and Quickcube tray.

SPECIAL FRIGIDAIRE CABINETS IN LOW PRICED FIELD

Glacier Gray Porcelain-on-steel—for Apartments and Homes

Whenever the architect is called upon to pare costs to the very minimum, he will welcome the new low-price line of Frigidaire models finished inside and out in attractive sanitary porcelain-on-steel. These models have been designed particularly to meet the demand for an inexpensive refrigerator but have been provided without sacrificing any of the essential qualities that have made Frigidaire famous for reliability, economy and long life.

Typical features to illustrate this point are the durable cabinets finished inside and out in gray porcelain-on-steel; the thick insulation sealed against moisture; the powerful compressor; the accessible Cold Control; and the generous food shelf area. These and other features are made possible at surprising low

cost only because of economies resulting from big scale production, General Motors resources and buying power—not to mention years of experience in refrigerator design and manufacture. With this new inexpensive Frigidaire available in a variety of sizes, no family or any income class can afford to do without the benefits of Frigidaire.

Model G-4 Specifications (For Unit Installation Only)

Food storage capacity: 4 cu. ft.

Food storage area: 6 sq. ft.

Dimensions: for complete dimensions see Page 2.

Ice making: with 111-TF coil, 2 trays, 24 cubes, 2 $\frac{1}{2}$ lb. of ice.

Compressor: Model FAH.

Cabinet: interior, one-piece gray vitreous Porcelain-on-steel lining.

Exterior, attractive gray Porcelain-on-steel. Equipped with glides.

Model G-6 Specifications (For Unit Installations)

Food storage capacity: 6 cu. ft.

Food storage space: 9 sq. ft.

Dimensions: for complete dimensions see Page 2.

Ice making: 115-TF coil, 2 trays, 42 cubes, approximately 6 lb. of ice.

Compressor for unit installation: Model F.

Cabinet: interior, one-piece, seamless, gray Porcelain-on-steel.

Exterior, attractive gray semi-flexible Porcelain-on-steel. Equipped with casters.

Model GR-4 Specifications (For Unit Installation Only)

Food storage capacity: 4 cu. ft.

Food storage area: 8 sq. ft.

Dimensions: for complete dimensions see Page 2.

Ice making: No. 110-TF coil, 2 trays, 24 cubes, 2 $\frac{1}{2}$ lb. of ice.

Compressor: Model FAH.

Cabinet: interior, one-piece gray Porcelain-on-steel lining.

Exterior, attractive gray Porcelain-on-steel. Equipped with glides.

Model G-3 Specifications (For Unit Installation Only)

Food storage capacity: 3 cu. ft.

Food storage area: 4.5 sq. ft.

Dimensions: for complete dimensions see Page 2.

Ice making: with No. 111-TF coil, 2 trays, 24 cubes, 2 $\frac{1}{2}$ lb. of ice.

Compressor: Model FAH.

Cabinet: interior, one-piece gray Porcelain-on-steel lining.

Exterior, attractive gray Porcelain-on-steel. Equipped with glides.

Model G-5 Specifications (For Unit Installation Only)

Food storage capacity: 5 cu. ft.

Food storage area: 8 sq. ft.

Dimensions: for complete dimensions see Page 2.

Ice making: with No. 115-TF coil, 2 trays, 42 cubes, 6 lb. of ice.

Compressor: Model F.

Cabinet: interior, one-piece, gray Porcelain-on-steel lining.

Exterior, attractive gray Porcelain-on-steel. Equipped with casters.

FRIGIDAIRE MULTIPLE INSTALLATIONS

For Apartment Houses

In apartment houses where low initial investment and greatest return are of paramount importance, the multiple system of refrigeration is chosen by many clients and architects. As shown by the diagram on this page, the multiple system provides for all the machinery in one location with the refrigerant piped to individual apartments through conduits and junction boxes.

Multiple installations are being used in thousands of apartment houses every year and wherever installed according to Frigidaire specifications have proved themselves completely satisfactory from the standpoint of both owner and tenants.

Frigidaire installation methods meet the approval of the National Board of Fire Underwriters as outlined in the code prepared by that body. Details concerning such installation methods will be gladly supplied by the local Frigidaire dealer.

With the Frigidaire Multiple System shown on this page, a central operating point for all compressors, located in the basement, is easily supervised by the janitor. Any adjustments can be made without annoyance to tenants.

Features of the Frigidaire Multiple System

The following are a few of the features of the multiple system:

- (1) Low initial investment and greater investment returns to apartment owner.

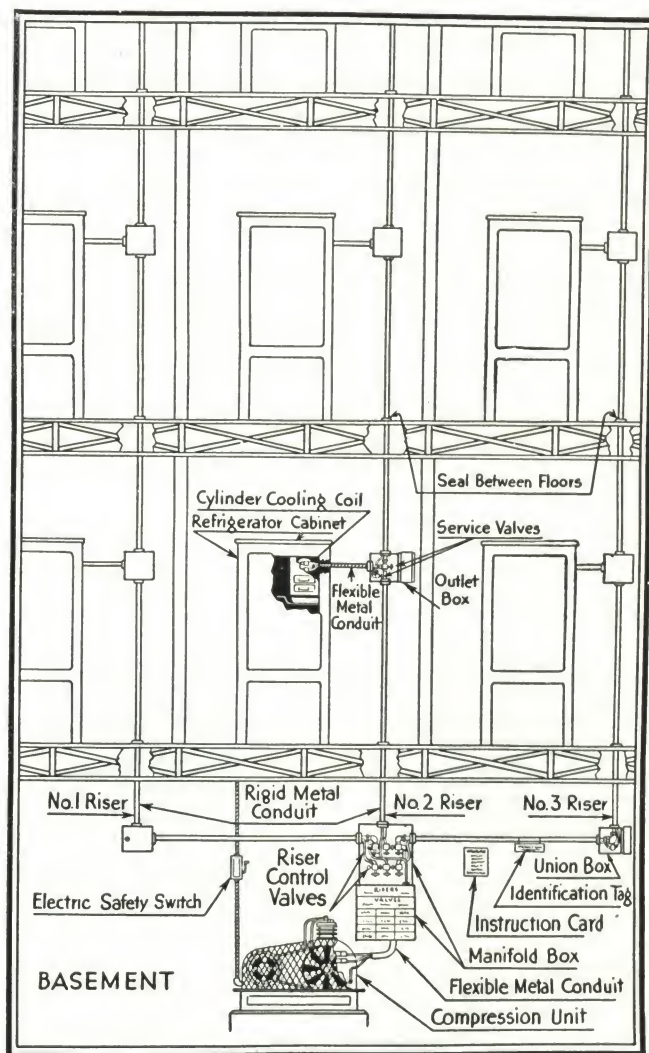

- (2) Economical cost of operating refrigeration.
- (3) A central operating point for all compressors, located in the basement, is easily supervised by the janitor and any adjustments can be made without disturbing tenants.
- (4) All defrosting is done periodically by the janitor.
- (5) Frigidaire uses a safe refrigerant, approved by the National Board of Fire Underwriters.
- (6) Vacant suites can be shut off at will. Valves in standard junction boxes located near each apartment enable

the janitor to shut off refrigeration in any apartment.

- (7) Each apartment suite is independent of the other.
- (8) Frigidaire multiple installations meet approval of National Board of Fire Underwriters.
- (9) There is no radio interference with Frigidaire.
- (10) All Frigidaire equipment is backed with a definite guarantee.

Special Models for Multiple Systems

Frigidaire models made specially for the multiple installation include the Models GM-5, GM-4 and GM-3. These are identical with the Models G-5, G-4 and G-3 respectively (see page 4) except that they have neither a Cold Control nor a compressor in the base.

FRIGIDAIRE COMMERCIAL EQUIPMENT

Adaptable and Flexible

Whenever his work includes plans or specifications for any kind of commercial refrigeration, the architect will find that Frigidaire equipment is so adaptable and flexible that it will meet practically any refrigeration need in a way that will create goodwill and satisfaction on the part of the clients.

Frigidaire Line Is Complete

The completeness of the Frigidaire line is well illustrated by the following list of equipment which is only partial:

- Cooling coils to fit any shape compartment and any fixture.
- Compressors up to $1\frac{1}{2}$ horsepower both air and water cooled.
- Water coolers of both bottle and pressure type.
- Water cooling systems.
- Ice cream cabinets.
- Combination ice cream and bottle beverage cabinets.
- Room coolers.

Advantages of the Frigidaire Unit System for Commercial Refrigeration

Before the development of Frigidaire, the common practice was to use one large refrigerating plant to meet all the requirements of a commercial installation. This system was, however, inflexible and sometimes not completely satisfactory.

The development of a complete line of Frigidaire Cooling Coils, Compressors and other equipment has made it possible for large refrigeration installations to be broken down into small units, each operating at its best efficiency and each taking care of one certain type of refrigeration requirement economically and dependably.

With this system entirely automatic operation can be secured. The expensive and cumbersome piping necessary with the central plant type of installation, together with the need for maintenance and renewal of piping is banished. The services of a refrigeration engineer can be dispensed with and more satisfactory temperatures will be obtained together with low operating expense.

Features of Frigidaire Commercial Refrigeration Installations

(1) **Equipment of Ample Capacity at Low Prices**—Frigidaire equipment is supplied at unusually low prices as a result of efficient quantity production, financial resources and engineering skill. But performance is never sacrificed in an effort to secure low prices. Every Frigidaire installation is engineered to do the job required in a reliable economical way.

(2) **Low Cost of Operation**—The operating cost of Frigidaire equipment has been proved very low in proportion to the temperatures required and the amount of space refrigerated. This is due to Frigidaire's sound design, careful manufacture and its principle of operating a relatively few hours out of every 24.

(3) **Trouble-free Automatic Operation—Negligible Upkeep**—Frigidaire equipment has a reputation for trouble-free automatic operation over long periods. This applies not only to the first two or three years it is installed, but for many years—long after the guarantee period has expired.

(4) **Equipment That Is Flexible**—Because it is often desired to change or alter commercial refrigeration fixtures after years of operation, the flexibility of Frigidaire is important. Frigidaire may be adapted to present fixtures or to any approved type the architect has in mind. Later, if so desired, the Frigidaire installation may be easily expanded or changed at minimum cost, often without interruption to refrigeration.

(5) **Equipment That Is Accessible**—Although Frigidaire provides the maximum in trouble-free refrigeration, Frigidaire engineers have so designed the equipment that it can be quickly adjusted or repaired on the premises at any time. In future years, if service should ever be necessary, this feature means much to clients and users, in low upkeep and uninterrupted refrigeration.

(6) **Equipment That Will Last a Lifetime**—Frigidaire equipment will perform reliably for a lifetime. The life of Frigidaire has never been determined because an early type of Frigidaire unit is still running and has been running continuously the equivalent of more than 25 years' operation in the hands of users. Such amazing results are secured because only the highest quality of materials are used on the manufacture of Frigidaire products; because all working parts are accurately ground to mirrorlike surfaces to eliminate wear and increase life; because the design is right.

Ice Cream Cabinets

Wherever his plans call for the storage of ice cream, the architect will find a wide variety of Frigidaire models enabling him to specify exactly the correct size and type for the need involved.

There are eleven models in all—two of them portable and the other nine of the standard type. The smallest is a 2-hole 10-gallon unit and the largest a big 12-hole, double row, 60-gallon model. Each one is rugged in construction, with sturdy reinforced angle iron frames, thick insulation sealed against moisture, and the famous Frigidaire Cold Control which gives finger-tip temperature control without affecting the automatic feature in any way.

Specifications are given below.

PORTABLE ICE CREAM CABINETS
Supplied as complete units

Model	Width, in.	Length, in.	Height, in.	Number of sq. sleeves
2-hole	20 $\frac{3}{4}$	30	52 $\frac{1}{4}$
4-hole	31	30	52 $\frac{1}{4}$	2

STANDARD SINGLE ROW ICE CREAM CABINETS

Model	Width, in.	Height, in.	Length without comp., in.	Length with comp., in.	Number of square sleeves
2-hole	19 $\frac{3}{4}$	30	37 $\frac{1}{4}$	63 $\frac{1}{4}$
3-hole	19 $\frac{3}{4}$	30	48 $\frac{1}{2}$	74 $\frac{1}{2}$
4-hole	19 $\frac{3}{4}$	30	60	86	2
6-hole	19 $\frac{3}{4}$	30	82 $\frac{3}{4}$	*	3

*With this cabinet the compressor is installed in the basement, in another room, or wherever convenient.

STANDARD DOUBLE ROW ICE CREAM CABINETS

Model	Width, in.	Height, in.	Length without comp., in.	Length with comp., in.	Number of square sleeves
4-hole	30	30	37 $\frac{1}{4}$	52	2
6-hole	30	30	48 $\frac{1}{2}$	63 $\frac{1}{4}$	3
8-hole	30	30	60	74 $\frac{3}{4}$	3
10-hole	30	30	71 $\frac{1}{4}$	86	4
12-hole	30	30	82 $\frac{3}{4}$	97 $\frac{1}{2}$	4

12-hole
Model

Combination Ice Cream and Bottled Beverage Cabinets

Wherever plans call for the storage of both ice cream and bottled beverages architects have found Frigidaire Combination Cabinets ideal since they meet requirements of those businesses that do not justify two pieces of equipment.

These are provided in two usable sizes—one with two round sleeves for ice cream and the other with two round and two square sleeves for ice cream. Both models include all the features of design and performance that have contributed to the success of Frigidaire Ice Cream Cabinets.

Model	Width, in.	Height, in.	Length without comp., in.	Length with comp., in.	Compartment size, in.		
					Width	Height	Length
2-hole	19 $\frac{3}{4}$	30	60	86	12 $\frac{1}{4}$	21 $\frac{1}{8}$	20 $\frac{3}{4}$
4-hole	30	30	60	74 $\frac{3}{4}$	22 $\frac{1}{2}$	21 $\frac{1}{8}$	20 $\frac{3}{4}$

2-hole Combination Cabinet

Frigidaire Water Coolers

The Frigidaire line of water coolers consists of models for bottled water and for city water connection. They may be obtained as complete self-contained units or for operation in a multiple hook-up in which several units are refrigerated by one compressor located in the basement or other location.

In addition, there are four water cooling tanks used in connection with separate bubblers, fountains, or faucets. These vary in maximum capacity from 2.5 to 20 gallons per hour, cooled from 80° to 50°; and are widely used by architects in office buildings, apartments, factories and other places where it is not desired to have separate water cooling units at each outlet.

Specifications are given below.

WATER COOLERS

Model	Capacity cooling from 80° to 50°, g.p.h.	Storage capacity, gal.	Exterior dimensions, in.		
			Width	Depth	Height
Bottle Type					
B-25	2.5	$\frac{1}{8}$	17 $\frac{3}{4}$	22 $\frac{3}{4}$	47 $\frac{1}{2}$ *
BC-25	2.5	$\frac{1}{8}$	17 $\frac{3}{4}$	22 $\frac{3}{4}$	47 $\frac{1}{2}$ *

The storage compartment in Model BC-25 is 9 1/2 in. wide, 12 in. high, 4 1/2 in. deep. *Less bottle.

Pressure Type

P-25	2.5	1/8	17 3/4	24 1/2	44 3/4
PC-25	2.5	1/8	17 3/4	24 1/2	44 3/4
P-45	4.5	2 1/8	17	23 1/2	38
P-60	6.0	4 1/8	35 1/2	18 1/2	38 1/2
P-150	15.0	5 3/4	35 1/2	18 1/2	38 1/2

The storage compartment in Model PC-25 is 9 1/2 in. wide, 12 in. high, 4 1/2 in. deep.

TANK TYPE

Tank No.	Max. capacity cooling 80° to 50°, g.p.h.	Storage capacity, gal.	Tank size, in.		Inlet and outlet pipes, in.
			Length	Diameter	
T-25	2.5	1/8	16 1/4	8 1/2	1/2
T-60	6.0	2 1/8	19 1/2	13 1/2	3/8
T-70	7.0	4 1/8	22 3/4	15	3/8
T-200	20.0	5 3/4	31 1/2	15	3/8

Frigidaire Room Cooler

The Frigidaire Room Cooler is a comparatively recent development which offers relief in three ways—by lowering the temperature, reducing the humidity and circulating the air. Architects will find it a method of achieving distinctiveness specifying equipment for large homes, private offices, and many lines of business, such as candymaking, where heat and humidity cannot be tolerated.

The cabinet has a standard exterior of steel finished in ungrained mahogany duco.

Width—22 3/4 in.; depth 21 3/4 in.; height 45 3/8 in.

Weight—215 lb.

Frigidaire Cooling Coils

Frigidaire Cooling Coils are available in many different sizes and capacities to fit practically any shape of cooling compartment and to meet practically any refrigeration need. Some have fins; some have flanges for brine tanks; some have ice trays; and some consist only of a cylinder and tubing.

Features of the coils include: use of copper or brass for greatest heat conduction and plated with pure tin for long life; drop forged brass fittings that eliminate the possibility of leaks; simple float valve construction that regulates the level of liquid refrigerating medium in the coil; silver soldered joints to assure strength and permanence; seam soldered fins to conduct heat rapidly from fins to refrigerating medium.

Frighdaire Compressors

Frighdaire Compressors are furnished in a variety of models in both air and water cooled types. Air cooled models are adaptable to practically any location that is adequately ventilated, while water cooled units are most efficient on heavy duty wherever a supply of cool running water is convenient.

Two of the most important features of Frighdaire Compressors are their surplus power and their low speed. Frighdaire and General Motors engineers believe that best results may be obtained when a compressor of relatively high capacity is designed to run only a comparatively few hours a day. Short running time is easy on the equipment and gives it long life. A large margin is also left to be used in case of unusual demands or unusually hot weather.

Frighdaire compressors are designed to operate at low speeds to lengthen the useful life of the unit. When larger capacity is required, a larger compressor of larger bore and stroke is provided, thus assuring that each compressor is of ample size to supply all the refrigeration required.

Air Cooled Units—Specifications of heavy duty Frighdaire Air Cooled Compressors for commercial uses are given here.

All those shown are of the sturdy, two-cylinder, slow speed, reciprocating type. All have large capacity condensers, cooled by scientifically constructed,

Model R
Air Cooled Compressor

found best for these particular models.

Belts are of the strong, silent V-type, developed in General Motors Laboratories.

AIR COOLED COMPRESSORS

Model No.	Motor h.p.	Width, in.	Length, in.	Height, in.	Belt	Weight, lb.
D	1 1/2	26 1/2	40	27	Double V	425
R	1	20 1/2	37	20	Double V	322
O	1/2	16	35	22 1/2	Single V	248
K*	1/2	14 3/4	30 3/4	30	Single V	206
AW	1/2	16 1/4	29 3/4	18	Single V	165
B*	1/4	20 1/2	26	30	Single V	160
A**	1/4	18 3/8	22	19 1/2	Single V	158
F	1/2	14 1/2	19 1/2	13 3/8	Single V	89

*Mounted in attractive cabinet—specially designed for ice cream cabinets.
**19 1/2 in. with legs, 15 3/4 in. without.

Water Cooled Units—Frighdaire Heavy Duty Water Cooled Compressors, are all of the two-cylinder, slow speed, reciprocating type that has proved so satisfactory in refrigeration work. All have entirely automatic water-flow regulators that are unusually economical in their use of water. All are equipped with a special safety switch which stops the compressor in case excess pressure develops in the system. The motors have been specially developed by General Motors to meet the exacting needs of refrigeration and are supplied to meet any type of electrical supply.

Belts are of the strong, silent V-type, perfected in General Motors Research Laboratories. Detailed specifications are given below:

WATER COOLED COMPRESSORS

Model No.	Motor h.p.	Width, in.	Length, in.	Height, in.	Belt	Weight, lb.
C	1	20	40	27	Double V	363
U	3/4	18 1/4	37	20	Double V	275
N	1/2	16	33	20	Single V	218
V	1/2	16	33	20	Single V	212

In Specifying Equipment—Since the specifying of compressors or other equipment, especially on multiple hookups, requires highly specialized knowledge, FRIGHDAIRE CORPORATION invites architects to take full advantage of the assistance available from the local Frighdaire Man.

Architects Are Cordially Invited

Architects are cordially invited to make free use of Frighdaire Engineering and Technical Facilities in all matters pertaining to refrigeration. With its large organization and its years of successful experience as a background, FRIGHDAIRE CORPORATION feels that a close friendly contact between the architect and local Frighdaire headquarters can be of no small mutual benefit. Every architect, it is believed, will also find it pays to have in his file the Frighdaire Architects Book (AF562 replacing AF417) which gives more complete details on equipment than can be included here.

KELVINATOR SALES CORPORATION

Kelvinator Electric Refrigerators DETROIT, MICH.

CANADA: KELVINATOR CANADA, LTD., LONDON, ONTARIO
ENGLAND: KELVINATOR, LTD., 258 Gray's Inn Road, LONDON, W. C. 1

Consult Telephone Directory for Local Addresses of Branch Offices

Product

AUTOMATIC REFRIGERATION for homes, apartments, stores, florists, restaurants, clubs, institutions, hospitals, dairy and ice cream equipment.

A complete line of WATER COOLERS for offices and industrial installations.

Also equipment for numerous special or unusual applications.

Organization

The pioneer manufacturer of automatic refrigeration for domestic use, with an engineering and manufacturing personnel brought up within the industry, and devoting their entire time to the creation and production of automatic refrigeration units and cabinets.

Facilities

Probably the largest plants in the world devoted entirely to the manufacture of refrigeration units and cabinets. The Kelvinator plant located at Detroit, Michigan, has a daily capacity of 2000 units. The Leonard division at Grand Rapids is among the world's largest manufacturers of refrigerator cabinets.

Co-operation

An international organization of distributors and dealers, supplemented by a staff of factory representatives fully qualified by training and experience to co-operate with architects and engineers in the preparation of specifications to meet every requirement, and accustomed to working with engineers and architects in the field. A direct advisory service with the factory at Detroit through distributors in all principal centers or through their associate dealers.

Architects' Manual

The Automatic Refrigeration Manual for Architects and Engineers, form No. 2013, contains photographs, line drawings and complete specifications of every Kelvinator cabinet in addition to specifications and data on water cooling and commercial equipment.

The Kelvinator Handbook of Electric Water Cooling for Architects and Engineers, form No. 2023, describes and illustrates the complete line of Kelvinator self-contained water coolers, also the evaporators and condensing units for use with approved water cooling equipment for multiple and circulating systems. It contains a complete description of all types of cooling equipment and service to which they are best adapted, together with application data that will enable the architect and engineer to compute requirements and specify equipment for any system.

These books have the proper A.I.A. file numbers for filing, and will be sent gratis if a request is addressed to the Kelvinator distributor in your city or to KELVINATOR SALES CORPORATION, Detroit, Michigan.

Domestic Equipment

There is a Domestic Kelvinator for every type of home. They range in food compartment size from 4 to 22 cu. ft. The exterior dimensions are such that almost every home has at least one convenient space large enough for a Kelvinator cabinet.

For luxurious homes, where only the best of equipment is installed, Kelvinator recommends its DeLuxe line. White porcelain with a gray trimmed exterior, electrically lighted one-piece porcelain interior. Frost chest for frozen food and ice cube storage, and of course, the

Iso-Thermic Tubes

These tubes concentrate low temperatures on the freezing tray when water or dessert is placed in the Kold Keeper sleeve. Their effectiveness is proved by the 80-minute, world's fastest freezing record established by Kelvinator in nation-wide tests

De Luxe Line

The finest conveniences in automatic refrigeration. Five cabinets comprise this line which embodies all the pioneering features that have made Kelvinator one of the outstanding names in the industry. These cabinets range in size from 6 to 22 cu. ft.

AA Condensing Unit

One of the Kelvinator domestic condensing units. Each of these units is the result of 17 years' engineering development. Any refrigerating cabinet can be equipped with one of the Kelvinator mechanisms

Standard Line

One of the cabinets in Kelvinator's Standard Line. These cabinets are in 4, 5 and 7 cu. ft. sizes, have tops and doors of white porcelain, and side and front panels of French gray porcelain

celebrated Kold Keeper with its superautomatic, fast freezing Iso-thermic tray. All these conveniences come with the DeLuxe line in cabinets from 6 to 22 cu. ft.

In addition to the DeLuxe line, there is the Yukon line for small families who do not require Kelvinator plus features. These cabinets have maximum shelf area in relation to the floor space required.

The Standard Line of cabinets fills the gap between the Yukon model and the DeLuxe Line. It has most of the Kelvinator plus features, and its cabinets have doors and tops of white porcelain with French gray side and front panels.

Kelvinator for Apartments and Flats

There are Kelvinator cabinets for every size and type apartment installation, both for individual self-contained models and multiple installations.

Both types of installation have their own advantages and either a self-contained or a multiple installation may be more advantageously used in different cities due to the variance in installation and rental conditions. The Kelvinator distributor in your city will gladly explain all the conditions concerning the advisability of installing either type—will explain the differences of each on the net rental return of the property.

The new Yukon models were designed especially for individual self-contained installation in apartments, flats and small homes. Where space is a controlling factor these cabinets are ideal, as they combine maximum ice making capacity with extremely large food storage

space and shelf area in cabinets of comparatively small exterior dimensions.

The Kelvinator line of cabinets for multiple installation is very complete and has many superior advantages. All Kelvinator cabinets can be placed anywhere and are also adaptable to permanently built-in installa-

tions. Their compact design minimizes the amount of space required—their attractive appearance fits in with any decorative scheme.

Kelvinator Water Cooling Equipment

Comprises a complete line of office type coolers designed for bottle service or for direct connection to city water supply.

Coolers are furnished in a choice of three colors and can be had either plain or with a compartment for cooling and storing beverages, milk, sandwiches, etc.

Office type coolers are equipped with a side faucet but a bubbler or combination bubbler and glass filler can be furnished to replace the faucet on the pressure type coolers.

A top bubbler, industrial type, is also supplied. Bottle type coolers have a capacity of $3\frac{1}{2}$ gal. of water cooled from 80° to 50° F. per hour. Industrial coolers and office pressure type have capacities of $3\frac{1}{2}$ and 6 gal. per hour, cooled from 80° to 50° F.

Kelvinator has approved several types of coolers that, in connection with Kelvinator heavy duty condensing units, comprise equipment that will handle large multiple or circulating systems.

Kelvinator Commercial Equipment

Kelvinator's Commercial equipment includes a unit for practically every commercial requirement. Numbered among the cooling units are coils of every size and capacity, from the Giant triple cross fin cooling unit for large walk-in refrigerators to the small submersion cooling unit for soda fountain use.

Twenty different compressors make up the line of Kelvinator condensing units. These range from $\frac{1}{8}$ to $1\frac{1}{2}$ h.p. For heavy duty work, Kelvinator manufactures both refrigerant-cooled and water-cooled cylinder heads on their compressors, thus assuring maximum refrigerating capacities and satisfactory performance.

As a means of simplifying the commercial application, Kelvinator has developed a very complete list of engineering tables for calculating commercial work. Our distributors throughout the country are thoroughly trained on commercial equipment, and may be called upon by the architect and engineer at any time for assistance along these lines.

Cooling Unit CT-20

A typical Kelvinator Cooling Unit equipped with two freezing trays of 21 cubes each for apartment use

Cooling Unit Model X5-140—Giant Cross Fin Type

A typical Kelvinator Cross Fin Cooling Unit for refrigerating large coolers and cabinets. Over-all dimensions: $66\frac{1}{4}$ in. wide, $22\frac{3}{4}$ in. deep, 5 in. high

Condensing Unit Model WR-40

A typical Kelvinator Heavy Duty Condensing Unit. Over-all dimensions: $37\frac{3}{4}$ in. wide, 18 in. deep, $24\frac{3}{4}$ in. high. Compressor—2 cylinder, vertical, reciprocating, single acting type. Motor—1 hp., designed and built for refrigerating duty. Condenser—dual spiral water tube inside liquid receiver. Liquid receiver—vertical type, steel, 8 in. diameter, $18\frac{1}{4}$ in. high. Base—cast iron

GENERAL ELECTRIC COMPANY

ELECTRIC REFRIGERATION DEPARTMENT

Hanna Building
1400 Euclid Avenue
CLEVELAND, OHIO

GENERAL ELECTRIC REFRIGERATOR

Product

GENERAL ELECTRIC REFRIGERATORS—for homes, apartments, clubs, restaurants, stores, institutions, hospitals and steamships.

Design

Designed to (1) occupy little space, (2) eliminate exposed moving parts, (3) require no attention, not even oiling, (4) eliminate servicing to a minimum, (5) provide constant refrigerating temperatures automatically, and at low cost, (6) reduce the possibility of gas leaks and other causes of failure to a minimum.

Development

The GENERAL ELECTRIC COMPANY needs no introduction to the architect, for G-E products everywhere bear a reputation for excellence.

In this age of electric refrigeration, a demand for a refrigerator bearing the G-E trade-mark was naturally created.

The demand made upon G-E engineers was as follows:

"Build us an electric refrigerator which will operate for years without attention. Make it spacious, sanitary, economical—eliminate all need for adjustment and oiling. Design it for the home and manufacture it with care."

It is done. The GENERAL ELECTRIC REFRIGERATOR meets the specifications. It is the result of fifteen years of research and experimentation by the GENERAL ELECTRIC COMPANY.

Several thousand electric refrigerators of nineteen different types were built, field-tested and improved before production of the present GENERAL ELECTRIC REFRIGERATOR was authorized. The GENERAL ELECTRIC REFRIGERATOR today embodies the best thought of the leading electrical research organization in the world.

General Advantages

In specifying GENERAL ELECTRIC REFRIGERATORS, the architect has the assurance that he is

Model S-62

specifying an electrical product that will give outstanding, continuous satisfaction. He eliminates the need of any unnecessary work, for no plumbing or extra wiring is required.

Nor does the GENERAL ELECTRIC REFRIGERATOR require a special location. The installation merely means uncrating the two boxes, placing the cabinet where it is to go, lowering the icing unit into the top of the cabinet, and plugging the attached cord into a convenience outlet. The switch is then closed and the installation is complete.

The GENERAL ELECTRIC REFRIGERATING icing unit is one of the simplest yet devised. It is built to automatically maintain the constant temperature necessary for proper food preservation—without

attention, not even oiling. The compactness of the evaporator gives more room for actual food storage.

If trouble should ever develop, the dealer simply raises the unit out of the cabinet and replaces it with a new one which he keeps on hand for emergencies.

And the GENERAL ELECTRIC REFRIGERATOR is clean. There is no exposed machinery—it is all contained in an hermetically sealed steel casing mounted on the top, up and away from floor dirt. The circulation of air through the coils prevents dust from settling on the top. The corners of the interior of the cabinets are rounded to make cleaning an easy task. All of the models are mounted on legs to permit cleaning of the floor underneath.

The GENERAL ELECTRIC REFRIGERATOR operates so quietly that it can hardly be heard, and the cold loss has been reduced to a minimum. It is guaranteed against defective workmanship and materials for two years.

The GENERAL ELECTRIC REFRIGERATOR has been approved by the Underwriters' Laboratories, Inc., and we believe that it surpasses in attractiveness and efficiency anything yet produced. We also believe that it will give the owner less trouble and use less current than any other.

SPECIAL NOTICE

Because of occasional changes in the design (manufacturing specifications) of some models, we suggest that you communicate with the local GENERAL ELECTRIC REFRIGERATOR Distributor or Dealer, or direct with this office for confirmation of the details (manufacturing specifications) of the various models quoted on these pages.

NEW YORK BOSTON CHICAGO INDIANAPOLIS CLEVELAND LOS ANGELES DETROIT

OPERATION OF THE GENERAL ELECTRIC ICING UNIT

For the purpose of explanation, the General Electric icing unit can be divided into four major parts:

(1) **The Super Freezer**—Sometimes called the evaporator or chilling unit. This is inside the cabinet.

(2) **The Compressor**—Which is inside of the hermetically sealed casing, and which compresses the gas after it has evaporated.

(3) **The Condensing Coils**—After the gas is compressed it is released into the hermetically sealed casing, and from there into the coils that surround the outside of the icing unit. The purpose of this is to condense the gaseous (SO_2) into a liquid.

(4) **The Control**—This regulates the operation of the machine and is so perfected that it provides an even temperature inside the cabinet.

Operation—The following paragraphs explain how heat is removed (or cold produced) in the complete GENERAL ELECTRIC REFRIGERATOR.

The liquid sulphur dioxide (SO_2) expands or evaporates in the freezing chamber, which is inside the cabinet. This action takes place at approximately 14° above zero. As it expands it becomes a vapor, and absorbs heat from the interior of the cabinet. This vapor passes through tube to the compressor, which is inside the hermetically sealed casing. The vapor is then

condensed to a dense vapor, and is discharged into the interior of the hermetically sealed casing. The vapor still contains the heat that it absorbed in the refrigerator. It then passes into the condenser. The air circulating around these coils cools the vapor, and the heat absorbed from the interior of the cabinet is given off into the air. When the heat is removed, the vapor condenses to a liquid again in much the same manner as cooling steam condenses into water.

This liquid goes through the float chamber, and from there back into the evaporator, where it expands again, absorbs more heat, and the cycle is repeated.

The frequency of the action is governed by the control, and the difference in temperature in the evaporator causes a deflection of the syphon bellows in the control apparatus. The control switch is thus actuated. This starts the motor at the high temperature limit and stops it at the low.

The above system of generating cold is probably the simplest and most trouble-free that has ever been devised for the home.

No Oiling

The no-oiling feature of a GENERAL ELECTRIC REFRIGERATOR takes on a new significance with tenant operation.

APARTMENT INSTALLATIONS

The newest household electrical servant, the electric refrigerator, has become so desired by tenants that apartment owners all over the country are wondering what is the best type of electric refrigerator to buy. They are interested in purchasing the type of equipment which will give the tenants the most satisfactory service and make the best investment for themselves.

It has always been accepted that the ideal apartment house refrigerator is one which is self-contained. For the simplicity of the individual system for apartment installations—its freedom from operating troubles and maintenance overhead, and the superiority of service—makes it the ideal refrigerator for apartment house use. And individual electric refrigerators have reached the point of development that the owner may now install this type of equipment and secure all its advantages.

Advantages of using GENERAL ELECTRIC REFRIGERATOR individual units.

(1) Ease of installation—no piping required in the walls.

(2) Accessibility—no danger of leaks, corrosion, etc., in inaccessible places.

(3) Portability—because the individual unit requires only an electrical connection it can be moved from place to place in the kitchen.

(4) Individual control of refrigerators in each apartment:

(a) Refrigerators in apartments not rented may be shut off when not in use.

(b) Easily accessible freezing regulator—each tenant can have the exact temperature regulation in their refrigerator that they desire.

(5) Continuity of service—if an individual unit fails, only one tenant is affected and replacement can be made very quickly.

(6) Ice cubes and frozen desserts can be made quickly in the individual installation. It is possible to do this even in the warmest weather.

(7) GENERAL ELECTRIC REFRIGERATOR individual units are air cooled, so there is no water expense.

(8) More equitable arrangement of charges with the tenant.

The individual system allows the tenant to pay for the electricity consumed by his individual unit. This is the most satisfactory method.

(9) The cabinet of the GENERAL ELECTRIC REFRIGERATOR is built like a safe—it cannot warp. It is strong, built to last.

For the small additional first cost of installing General Electric refrigeration, the owner has a building that is greatly enhanced in resale value, more attractive to discriminating tenants, and more readily rentable. He has free service for two years, with only nominal service charges thereafter, no electricity bills (each tenant pays his own) negligible repair costs and depreciation, and no supervision is required.

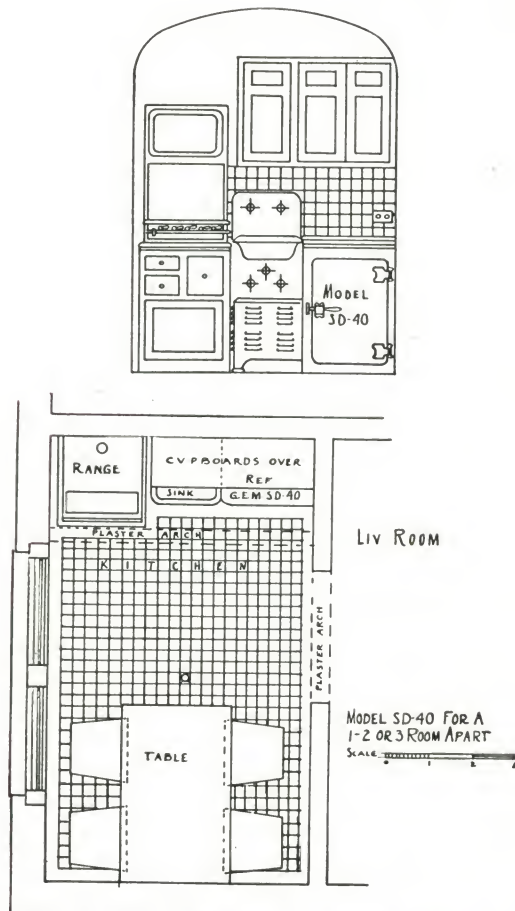

Diagram of Built-in Apartment Kitchen

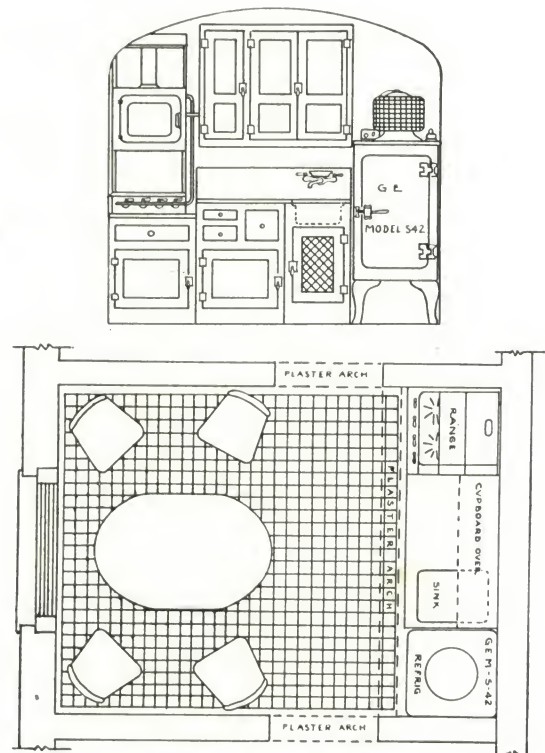

Diagram of Kitchen Layout

General Electric Refrigerators Offer These Vital Advantages

- an hermetically sealed, dustproof mechanism.
- an easily accessible freezing regulator.
- a mechanism that requires no oiling.
- all troublesome machinery eliminated.
- a new standard of quiet operation.
- mounted on legs with broom-room underneath.
- no installation problem whatever.
- a sanitary, porcelain chilling chamber.
- the entire mechanism mounted on top.
- maximum food storage space in the cabinet.
- an appreciably lower cost of operation.
- a radically improved type of cabinet.
- an unqualified two-year guarantee.

Architects' Handbook

To assist architects in the selection of proper refrigeration facilities, an "Architects' Handbook on Electric Refrigeration" has been published by the Electric Refrigeration Department of the GENERAL ELECTRIC COMPANY.

This interesting booklet contains complete information on electric refrigeration and copies are available, free of charge, on request.

Specifications Model S-42

Food Storage Capacity—4 cu. ft.

Food Shelf Area—7½ sq. ft. Straight wire shelves.

Ice Making—48 cubes in two trays. Arranged for fast freezing.

Refrigerating Unit—(DR-1) ½ hp. single-phase induction type. All moving parts enclosed in hermetically sealed casing.

Cabinet—"All Steel" type construction in which no wood frame is used either in the cabinet or doors. Black "Textolite" strips are used on the door and door jamb. A removable rubber gasket seals the door. Shelves are straight bar type welded together and heavily tinned. Hardware is chromium finish.

Interior Finish—White vitreous porcelain.

Exterior Finish—White "Sanak."

Weight—

Unit—136 lb.

Cabinet—187 lb.

Shipping Weight—

Unit with accessories—192 lb.

Cabinet—244 lb.

GENERAL ELECTRIC

COMMERCIAL REFRIGERATORS

The "GENERAL ELECTRIC" REFRIGERATOR either for commercial or domestic use is a package article. Both the refrigerating unit and cabinet are completely assembled ready for installation and operation.

Thus the purchaser gains the following advantages:

(1) Refrigerating unit is completely assembled in a modern plant under strict supervision.

(2) The responsibility for successful operation is centered in one company.

(3) A minimum of floor space per cubic foot of food storage capacity is occupied by both refrigerating unit and cabinet.

(4) The refrigerating unit is hermetically sealed.

(5) Economy in operation is the result of high efficiency.

(6) No costly labor is necessary in the field to insure continued operation.

(7) Expensive maintenance is eliminated since there are no exposed moving parts to wear out.

(8) No oiling or service are required.

(9) Quiet operation.

(10) The correct refrigerating unit and cabinet is sure to be installed for the performance of a given task.

(11) Guaranteed by GENERAL ELECTRIC COMPANY.

All modern merchandising tends toward the package line of goods. The reason for this tendency is quite obvious when we consider that simplicity is the keynote of everything that is really great. What could be more obvious and, what could be more appropriate in this day of time, labor and money savers than to have the GENERAL ELECTRIC COMPANY produce an electric refrigerator employing the package article principle for commercial use?

Model CS-600

Model CS-601

Model CS-602

Description of Model CS-600

Food Storage Capacity—60 cu. ft.

Shelf Area—75 sq. ft. Heavily tinned straight wire shelves adjustable to 2-in. spacing.

Finish—Interior and front of cabinet including door panels—white porcelain on steel. Top and sides of cabinet—white lacquer on steel. Back and bottom of cabinet—galvanized iron. Porcelain enameled cast iron legs. Exterior trim—non-corrosive metal chrome plated and polished. "Textolite" door and door jamb strips. Special moulded rubber door gaskets.

Hardware—Is hard brass, chrome plated. All doors have spring lock latches.

Insulation—Is 4 in. thick wrapped and sealed according to General Electric specifications.

Drain—Removable vitreous enamel drip pan is located beneath chilling unit, and connected by nickel plated brass pipe to trays and drain.

Installation—Cabinet can be taken apart for installation if necessary. Minimum room height required to install unit in assembled cabinet—9 ft. 5 in. Minimum room height required to install unit in cabinet, front removed, and allowing 10 in. clearance above installed unit—8 ft. 6 in.

Refrigerating Unit—Model DR-5. Self-defrosting. No ice making. (See second page following.)

Description of Model CS-601

Food Storage Capacity—

Shelf Compartment—43½ cu. ft. Shelf area—56 sq. ft.

Meat Compartment—16½ cu. ft. Meat racks—7 ft. total length.

Total—60 cu. ft. net.

Heavily tinned straight wire shelves adjustable to 2-in. spacing.

Meat hooks in right end compartment.

Finish, Hardware, Insulation, Drain, Installation and Refrigerating Unit are the same as for Model CS-600.

Description of Model CS-602

Food Storage Capacity—

Shelf Compartments—27 cu. ft. Shelf area—36 sq. ft.

Meat Compartments—33 cu. ft. Meat racks—14 ft. total length.

Total—60 cu. ft. net.

Heavily tinned straight wire shelves adjustable to 2-in. spacing in two center compartments. Meat hooks in right and left end compartments.

Finish, Hardware, Insulation, Drain, Installation and Refrigerating Unit are the same as for Model CS-600.

Compressor

The compressor is of the twin oscillating cylinder type, direct connected to the motor. The stuffing box is eliminated by having the motor mounted inside of the hermetically sealed housing.

Compressor

The compressor is of the twin oscillating cylinder type, directly connected to the motor. The stuffing box is eliminated by having the motor mounted inside of the hermetically sealed housing.

Evaporator

White porcelain on steel. Operates on a defrosting cycle.

Lubrication

All moving parts are liberally supplied with oil by means of a simple forced feed system. Each unit has a permanent supply of 4 1/2 qts. of special mineral oil. No re-oiling is necessary, since the hermetically sealed design eliminates the factors which ordinarily cause the deterioration of oil.

Mounting

The compressor unit is mounted on three vertical springs inside of the housing to insure quietness of operation and freedom from vibration.

Motor

A single phase, 1/2 hp., 220 volt condenser motor is used. The condenser motor represents the latest development in high efficiency, high power factor, fractional horse-power motor design.

The motor does not cause radio interference, since it has no brushes or sliding contacts.

The power input to the motor, under normal conditions of operation, is approximately 475 watts. The power factor is above 85%.

Capacity

2100 B.t.u. per hour; 80° F. room; 20° F. chilling unit.

Evaporator

White porcelain on steel, operates on defrosting cycle.

Lubrication

All moving parts are liberally supplied with oil by means of simple forced feed system. Each unit has a permanent supply of 3 1/2 qts. of special mineral oil. No re-oiling is ever necessary.

Mounting

The compressor unit is mounted on three vertical springs inside the housing to insure quietness of operation and freedom from vibration.

Motor

A single phase, 1/3 hp., 110 volt condenser motor is used. The condenser type motor represents the latest development in high efficiency, high power factor, fractional horse-power motor design. The power input to the motor under normal operating conditions is approximately 370 watts. The power factor is 82%.

Capacity

1400 B.t.u. per hour; 80° F. room; 20° F. chilling unit.

Control

The automatic control maintains a uniform temperature in the cabinet. It has an overload relay which protects the motor against abnormal conditions. It also has a manual switch for starting and stopping the unit.

General Electric Refrigerating Unit Model DR-5

Dimension Drawing Unit Model DR-5

Control

The automatic control maintains a uniform temperature in the cabinet. It has an overload relay which protects the motor against abnormal conditions. It also has a manual switch for starting and stopping the unit.

Immersion Type Milk Cooler

Cabinet—All wooden framework and trim is built of well-seasoned cypress protected with a waterproofing varnish.

Four 10-gal. Can Size

The exterior metal panels are made of galvanized, rust-resisting ingot iron finished with waterproof battleship gray paint.

Exterior Dimensions—

Body—73½ in. wide; 35¾ in. deep; 33½ in. high.

Unit Over Cabinet—20¼ in.

Total Height Unit and Cabinet—56¾ in.

Interior Dimensions—65½ in. x 28½ in. x 28¾ in.

Inner Tank—Heavy galvanized rust-resisting ingot iron.

Floor Racks—Floor racks are provided to protect the bottom against damage.

Door Opening—18¾ in. x 28½ in.

Insulation—Approved General Electric specifications.

Unit Used—(DRD-4)—A single-phase ½-hp. 220-volt condenser motor is used. The condenser motor represents the latest development in high efficiency, high power factor, fractional horse-power motor design. It has a special copper coil type evaporator designed especially for operation when immersed in water bath.

The unit is available for operation on the following sources of power:

220-volt alternating current, 50 or 60 cycle.

110-volt alternating current, 50 or 60 cycle with transformer.

Drain—¾-in. galvanized pipe located at right end of cabinet.

Ice Freezer

Ice Freezing Capacity

Twelve trays of ice may be frozen at one time, each holding 2½ lb. or a total of 30 lb. of ice. As each freezing is completed, the ice cubes may be removed from the trays and stored in the space below the evaporator, thus permitting the trays to be refilled and frozen again. Between 50 and 60 lb. of ice in cube form may be stored which, in addition to the 30 lb. in the ice trays, insures a reserve supply for immediate use or to carry over periods of heavy demand. Ordinarily a complete freezing is accomplished in from 6 to 7 hours.

Normal operation of the refrigerating unit will maintain the cabinet temperature at about freezing or slightly below, minimizing or preventing meltage of the stored ice cubes.

The ice storage basket is placed in a porcelain steel pan and is so arranged as to keep the ice cubes about 1 in. off from the floor of the pan. Thus, if any meltage does take place, the ice cubes will be above the level of the water.

Refrigerating Unit

The refrigerating unit is of the General Electric hermetically sealed design Model DRF-4.

The compressor is direct connected to a ⅓-hp., 110-volt condenser motor. The condenser type motor represents the latest development in high efficiency, high power factor, fractional horse-power motor design. The power input to the

motor under normal operating conditions is approximately 370 watts. The power factor is 82 per cent.

The operation of the unit is automatic and requires no attention—not even oiling.

All Steel Model S-62 Cabinet with DRF-4 Refrigerating Unit

Biological Refrigerator

Construction

This refrigerator is designed to meet the needs of pharmacies, hospitals, laboratories, where biologicals, serums, and various chemicals and test samples must be kept at temperatures below 50° F.

This biological refrigerator consists of a standard General Electric all-steel S-62 cabinet with a standard DR-2 unit. The rack and drawers are designed so that they can be installed through the door of the cabinet.

Adjustable side angles are provided to hold the drawers rigidly in place.

Two sets of racks and drawers can be used in a S-140 cabinet to take care of requirements greater than can be handled with the S-62 model. This equipment when ordered for use in model S-140 should be so specified, as a center tie iron is necessary to hold the two drawer frames together.

The control on the unit is set to maintain temperatures in the cabinet below 50° F., just as in the standard domestic cabinets. If certain installations require that the temperature in the cabinet shall not vary more than 2° F., under any condition, a special thermostat is necessary. Individual cases of this type should be taken up with the Commercial Engineering Department.

All Steel Model S-62 Refrigerator, Equipped with Biological Drawers

GENERAL ELECTRIC

WATER COOLERS

Specifications for General Electric Pressure Water Cooler

Model DP-1

Note: The DP-1 cooler is not designed for use with remote bubblers or for glass filling requirements.

General

The Model DP-1 cooler is completely self-contained, the compressor, cooling compartment, and drinking fountain being mounted in one all-steel cabinet. The refrigeration system is hermetically sealed just as the other standard General Electric domestic and commercial refrigerating units. Each unit is completely assembled, charged and tested in a 100° F. room before shipment from the factory. The DP-1 cooler is exceptionally quiet in operation.

The compressor is of the single oscillating cylinder type direct connected to a $\frac{1}{10}$ hp. single phase motor. All moving parts are liberally supplied with oil from a permanent supply by means of a simple forced feed system.

The condenser and compressor are air cooled, although the waste water from the bubbler assists in cooling the condenser in the last turn of the pre-cooler.

The vitreous china top of which the bubbler bowl is an integral part, the acid resisting porcelain cooling compartment, and the cabinet on legs are unusual features of sanitation.

In the DP-1 cooler waste water is used to pre-cool the inlet water and thereby greatly reduces the energy consumption per gallon of water delivered.

The pre-cooler consists of two tinned copper coils, one within the other. The waste water flows through the inner coil and the inlet water in the outer.

Cooling Compartment

The cooling compartment consists of an acid resisting porcelain enameled evaporator, with a quick cooling device of corrosion-resistant metal. Efficient cooling is secured by having the drinking water in direct contact with the refrigerant compartment.

Bubbler

The bubbler is of the angle stream type.

Temperature Control

A temperature control is provided with a dial adjustment so that the drinking water temperature may be regulated by the user between 40° and 60°.

Pressure Regulator

Each cooler is supplied with an automatic pressure regulator which must be connected in the water supply line.

No external trap is necessary since the waste line is trapped inside of the unit. A plug is provided in the rear to drain this trap.

Weight

Crated, 426 lb.; uncrated, 335 lb.

Model DP-1

Dimension Diagram Model DP-1

Specifications for General Electric Pressure Water Cooler Model DP-3

General

The model DP-3 cooler is completely self-contained, the compressor, cooling compartment, and drinking fountain being mounted in one all-steel cabinet. The refrigeration system is hermetically sealed just as the other standard General Electric domestic and commercial refrigerating units. Each unit is completely assembled, charged and tested before shipment from the factory. The DP-3 cooler is exceptionally quiet in operation.

The compressor is of the single oscillating cylinder type, direct connected to a $\frac{1}{2}$ hp. condenser motor.

The moving parts of the unit are liberally oiled from a permanent supply by means of a simple forced feed system.

The vitreous china top, of which the bubbler bowl is an integral part, the porcelain cooling compartment, and the cabinet on legs are unusual features of sanitation.

In the DP-3 cooler waste water is used to pre-cool the inlet water and thereby greatly reduces the actual refrigeration required of the unit per gallon of water delivered. This feature is exclusive with the General Electric pressure coolers and contributes greatly to their high operating efficiency.

Cooling Compartment

The cooling compartment consists of a steel chamber finished on the interior with porcelain enamel. Efficient cooling is accomplished by having the drinking water in direct contact with the refrigerant compartment. In addition, quick cooling is produced by directing the inlet water so that it comes in contact with both the outside and inside surfaces of the refrigerant compartment, thus providing a large surface for cooling.

Bubbler

The bubbler is of the angle stream type.

Temperature Control

A temperature control is provided with a dial adjustment so that the drinking water temperature may be regulated, by the user, between 40° and 60°.

Water Cooler Condenser

The condenser of the refrigerating unit is water cooled. It is the double tube, counter flow type and is supported in a jacket filled with a non-freezing, non-corrosive fluid.

The flow of condenser cooling water is regulated by a valve which is operated thermostatically and in accordance with the temperature of the condenser.

Pressure Regulator

The DP-3 cooler is supplied with an automatic pressure regulator which is connected in the cold water supply line to the bubbler and which is mounted inside the cooler casing.

Capacity

There are several different methods or ways of using the DP-3 cooler and its capacity will depend to a certain extent upon the type of installation.

Carafe Filler

Each DP-3 cooler is provided with a connection on the right-hand side to which a self-closing spigot can be attached. A standard waste water receptor as used on the Model DB-1 bottle water cooler is used.

Glass Filling Attachment

The standard DP-3 cooler can be equipped with a glass-filling attachment for restaurant use. To use the glass-filling fixture it is merely necessary to unscrew the standard nozzle and replace it with the special fixture.

Weight

Net, 325 lb. Shipping, 425 lb.

Model DP-3

Dimension Diagram Model DP-3

5-GALLON BOTTLE WATER COOLER

Model DB-1

Specifications

Evaporator

A white porcelain evaporator with a capacity of 2 qt. forms the water cooling compartment. It has no seams or crevices, is absolutely sanitary.

Compressor

The compressor unit is of the single oscillating cylinder type, direct connected to the motor and is enclosed in a hermetically sealed casing.

Lubrication

All moving parts are liberally lubricated by a simple, forced feed oiling system from a permanent oil supply, eliminating the necessity of ever re-oiling.

Condenser

The condenser is air cooled.

Motor

A small $\frac{1}{10}$ hp., 60 cycle, 110 volt, induction type motor is used. Since no commutator or brushes are used on this motor, it does not cause radio interference.

Control

The cooler is equipped with a temperature regulating control which automatically maintains the drinking water at the desired temperature.

Waste Basin

The waste basin has a capacity of 3 qts. It is readily removable for emptying.

Capacity

Two gal. per hour, cooled from 80° F. to 50° F. in an 80° F. room.

Weight

185 lb.

Shipping Weight

225 lb.

WILLIAMS OIL-O-MATIC HEATING CORPORATION

Williams Ice-O-Matic Electric Refrigeration

FACTORY
BLOOMINGTON, ILL.

FACTORY BRANCH OFFICES
NEW YORK, Graybar Building CHICAGO, 185 North Michigan Avenue

Products

Williams Ice-O-Matic and Ice-O-Matic Capitol refrigeration for domestic uses with 4 to 19 cu. ft. of storage space; commercial installations up to 1500 lb. melting ice equivalent. Available as self-contained or multiple-unit installations in apartment houses. Water coolers, milk coolers, etc., have been adapted for Ice-O-Matic operation. (The Good Housekeeping Institute and Underwriters' Laboratories have approved Ice-O-Matic.)

For Williams Automatic Oil Burners, see Manufacturers' Index.

Company

Ice-O-Matic is built and backed by the WILLIAMS OIL-O-MATIC HEATING CORPORATION whose home utilities are now serving more than 100,000 owners. Ice-O-Matic is sold and serviced by Williams dealers throughout the United States and in 44 other countries.

WILLIAMS
ICE-O-MATIC
REFRIGERATION

models have electrically lighted interiors.

Refrigerating Units

Williams Engineers perfected a patented device which permits successful use of the coldest known domestic refrigerant—methyl chloride. At atmospheric pressure methyl chloride boils at -10.65° F. This colder refrigerant permits compressor to operate fewer minutes each day—thus lengthens useful life—and lowers operating cost.

Methyl chloride is so pure it has long been used to "freeze" small areas for minor surgical and dental operations. Its high cost prohibited wide use but since the war it has been produced in this country on a practical, commercial scale. All gases, except pure air, are toxic to different degrees. Government tests prove that methyl chloride is among the least toxic of common refrigerants.

Methyl chloride is stable and chemically inert in the presence of metals, moisture, air and lubricating oils.

Williams Ice-O-Matic and Ice-O-Matic Capitol compressors operate only when temperature around the cooling unit rises above a predetermined point. This point may be manually changed by a new temperature control.

During a test—which is still being conducted—an Ice-O-Matic unit was operated continuously, without stopping, for more than 27 months. No oil or refrigerant was added during this severe run which is equal to more than 15 years of normal service.

Williams Ice-O-Matic compressors are built in four sizes, to efficiently handle the smallest domestic cabinets, or commercial installations. Evaporators (cooling units) are available in a multiplicity of sizes and shapes to fit practically any installation.

Note: Location of the Ice-O-Matic Capitol sealed unit is optional. It may be placed either on top of the cabinet, self-contained in a cabinet having a lower compartment, or located remotely in the basement.

Cabinets

Williams Ice-O-Matic is offered in a complete line of cabinets for all domestic needs. Various sizes and styles are in stock for immediate shipment. Several makes of commercial cabinets have earned the recommendation of Ice-O-Matic engineers for business uses. Write for details on your job.

Williams Ice-O-Matic domestic cabinets are lined and covered with rust-resisting steel mounted on a wood frame. There is no metal-to-metal contact to reduce insulating capacity. The insulating material is extra thick corkboard or other approved material, proofed against moisture or sagging. Door openings are sealed with double gaskets and the doors are closed tight automatically with self-locking latches. Several

Information

Detailed information on refrigerating problems is offered you by factory engineers.

BOHN REFRIGERATOR COMPANY

Manufacturers of Super-Quality All-Porcelain Refrigerators

ST. PAUL, MINN.

RETAIL STORES IN CHICAGO, NEW YORK AND BOSTON

Localities Not Represented by a Merchant Are Served Promptly from the Factory

The Bohn Refrigerator

Bohn is the world's largest manufacturer of all-porcelain refrigerators. Representative Bohn installations include exclusive use of Bohn refrigerators in all Pullman-built railway dining cars, thousands of America's finest homes, and many hospitals, hotels, and restaurants. Practically all of the United States army barracks and battleships are Bohn equipped, while ninety per cent of the railway refrigerator cars in this country have the Bohn insulation and Bohn Syphon system.

All Bohn refrigerators are equipped with a dual-use cooling chamber, rendering them instantly adaptable to electric refrigeration as well as ice. Special doors for outside‡ icing are available, if desired.

Model No. 23 1/4

Bohn Syphon Series

Outstanding among the several porcelain refrigerator lines is the famous Bohn Syphon series. This series, which incorporates the Bohn Syphon air circulating system, is known throughout the world for its ability to properly preserve foodstuffs and do so at minimum operating cost. These beautiful models are made of white porcelain, exterior and interior.

Fine points of construction include a one-piece steel porcelain lining with fully rounded corners, very heavy insulation and sturdy inside framing construction, hinges and automatic fasteners of solid brass, nickelplated; front drain for accessibility, safety vault door construction with cushion gaskets, stream line nickel trim on exterior case, patent syphon, and cold air reservoirs for circulation.

ILLINOIS REFRIGERATOR CO.

Manufacturer of Cabinets for Ice and Electrical Refrigeration

OFFICE AND FACTORY
MORRISON, ILL.

REPRESENTATIVES IN ALL PRINCIPAL CITIES

Products

ILLINOIS-AUTOMATIC ELECTRIC REFRIGERATION CABINETS.

Also Illinois-Automatic Ice Refrigeration Cabinets.

Illinois-Automatic Household Electric Refrigerator Cabinets

These modern cabinets are made by pioneers and leaders in the manufacture of refrigerator cabinets. Illinois-Automatic models are the up-to-date result of 40 years of experience—adequately meeting the five essential requirements of a satisfactory, economical refrigerator:

Size—Illinois-Automatic Cabinets are made in a large variety of sizes. There is therefore at least one model ideally suited to practically every requirement and size limitation. In addition, these cabinets have unusually generous shelf room.

Construction—Illinois-Automatic Cabinets are built "to last a lifetime." The workmanship and materials put into them are of exceptional quality and carefully checked at each step of manufacture. Before shipment, every Illinois Cabinet passes a rigid inspection.

Economical Operation—Dry Zero, the new insulation material, makes Illinois-Automatic Refrigerator Cabinets 15 to 25 per cent more efficient. Thus, they function at the least expense. And, because of their superior construction, these cabinets require no upkeep.

Air Circulation—To preserve the freshness and tastiness of foods, a continuous air circulation is necessary. Illinois-Automatic Cabinets are so designed as to insure the circulation of fresh air at all times.

Attractive Appearance—This requirement is becoming more important every day. The appearance and interior arrangement of the refrigerator very often help swing the sale or rental of a house or apartment.

With this clearly in mind, we have built our line of cabinets along pleasing lines, finished them in smooth,

blemish-free porcelain and enamel, and trimmed them with well-placed silvered hardware of exceptional strength and dependable operation.

Summary

Consequently, in specifying Illinois-Automatic Cabinets, the architect or contractor assures himself of well-built, lasting refrigerators, modern in construction and appearance, economical in operation, adaptable in size to practically any space and designed for adequate air circulation.

Models

Illinois-Automatic Cabinets are built in both base and leg models. However, all base models can, on special order, be furnished with legs 5, 6½, 8 or 10½ in. high.

Information

We will be glad to forward on request full details and specifications on our complete line of cabinets for both electric and ice refrigeration.

THE INTERNATIONAL NICKEL COMPANY, INC.

Monel Metal and Nickel and Allied Products

EXECUTIVE OFFICES

67 Wall Street
NEW YORK, N. Y.

MINES AND SMELTER: Copper Cliff, Ont., Canada
ROLLING MILL AND REFINERY: Huntington, W. Va.

REFINERY: Port Colborne, Ont., Canada
FOUNDRY: Bayonne, N. J.

For Our Other Products, see Manufacturers' Index

Products

MONEL METAL—available from stocks conveniently located throughout the country and made in all commercial forms required by manufacturers of refrigerators. (See Manufacturers' Index, our section on Metals, for commercial forms and location of warehouses.) All necessary accessories such as nuts, bolts, screws, rivets, etc., are also available.

Cabinets—Linings, exteriors (front, sides, etc.) trim and shelving.

Cold Food Storage Fixtures—All Monel Metal.

Cold Storage Doors—Linings, facings.

Monel Metal

Monel Metal is a registered trade-mark applied to a technically-controlled nickel-copper alloy of high nickel content. Monel Metal is mined, smelted, refined, rolled and marketed solely by International Nickel.

Advantages of Monel Metal for Refrigerators

- (1) Absolutely rustproof.
- (2) Resists corrosion by food juices and fruit acids.
- (3) Strong as steel; tougher than steel.
- (4) Easy to clean; therefore sanitary.
- (5) Beautiful appearance; has color of platinum.
- (6) Low conductivity—retains heat or cold.
- (7) Durable—proven by over 20 years of service.
- (8) Easily fabricated.

Proven Uses of Monel Metal in Refrigerator Equipment

Monel Metal is used for all exposed surfaces where appearance, cleanliness and long life are required on the following types of refrigerator equipment:

Built-in Refrigerators—Doors, linings, shelving.

Services

Architects and engineers are invited to make use of the extensive advisory service maintained by this organization. A call to any of our sales offices, listed in our section on Metals, will bring you a specialist trained in the particular application of Monel Metal you are dealing with.

In co-operation with refrigeration engineers, Monel Metal specialists can contribute materially in the application of Monel Metal to refrigerator equipment.

Available Publications

To assist architects and engineers to form a clearer conception of the possibilities for the application of Monel Metal, THE INTERNATIONAL NICKEL COMPANY, INC., has prepared a special reference book on all types of food service equipment.

"Architects Food Service Handbook"—A reference book prepared for the profession. Contains complete information on the design and construction of food service equipment, choice of materials of construction and illustrations of correct methods of writing specifications for all types of equipment. *A special section of this handbook deals exclusively with refrigerator equipment.*

Jewett Solid Porcelain Refrigerator for Residences and Hospitals

This has the unusual construction of an interior lining of *solid porcelain* (snow-white earthenware $1\frac{1}{4}$ in. thick), glazed and fired at 2500° F. The compartments for food as well as for the mechanical apparatus (or ice) are likewise of solid porcelain, without a seam, joint, crack or square corner. The shelves are the only metal part in the refrigerator. With this solid porcelain lining and pure cork insulation, these refrigerators are particularly adapted for use with any type of electric refrigeration you may select.

Complete catalogue will be furnished on application.

Jewett Solid Porcelain Refrigerator Installed

In addition to the regular Jewett Solid Porcelain Refrigerators, we have available twelve models of Jewett Solid Porcelain Refrigerators designed for use with General Electric icing units, illustrated in brochure which we invite you to write for.

G-E Model for Use with General Electric Icing Units

Jewett Refrigerators for Hotels, Hospitals, Clubs and Institutions, Mortuary Refrigerators for Hospitals

Special built-to-order refrigerators, constructed from detailed drawings and specifications, have been installed as indicated in the following reference lists. We offer our services, without obligation, in designing suitable refrigerators for the uses intended.

LEONARD REFRIGERATORS

LEONARD REFRIGERATOR COMPANY

DETROIT, MICH.

FACTORY: GRAND RAPIDS, MICH.

REPRESENTATIVES IN ALL PRINCIPAL CITIES

Service

With its half a century experience in manufacturing ice refrigerators and electric cabinets for the refrigeration industry, Leonard is in the position to give valuable information to architects and contractors regarding their specifications for all-porcelain, all-steel, all-modern and all-performance refrigerators for homes, hotels, restaurants, cafes, clubs, grocers, meat markets and delicatessens.

Leonard is one of the largest (exclusive) refrigerator cabinet plants in the world and has been a leader in

the industry for over seventeen years. Leonard is truly "Refrigerator Cabinet Headquarters," and its engineers and vast research facilities in the refrigeration field, are ever ready to help in your building and contracting problems. All requirements and specifications sent into the LEONARD REFRIGERATOR COMPANY will promptly be taken care of, and suggestions made.

Leonard offers to the building trade two special all-steel self-contained unit electric refrigerators for 1931—five and seven cu. ft. cabinets ready for immediate installation.

Standard Specifications for Five Cubic Foot Cabinets

Height (includes 4½-in. removable legs)	50 in.
Width (over all)	26½ in.
Depth (over all)	23¾ in.
Depth (without hardware or door)	21⅜ in.

Cubical capacity (total)	5.15 cu. ft.
Cubical capacity (food storage)	4.68 cu. ft.
Shelf area including bottom and defrosting pan	9.16 cu. ft.
Insulation (Leonard Approved) Door—light weight sealed slab	2½ in.
Interior finish (all rounded corners inside)	Porcelain on armco iron
Exterior finish	White lacquer enamel
Hardware	Butler chrome
Hinges	Right or left-hand optional
Defrosting pan—glass . 15 in. deep, 9¾ in. wide, 2 in. high	

Ice Maker Data for Five Cubic Foot Cabinet

Freezing trays (one metal and one rubber grid)	2
Ice cubes	42
Pounds of ice (per freezing)	4

Special Features for Five Cubic Foot Cabinet

- (1) Quick and easy removal of the cooling unit and condensing unit *together*.
- (2) Strong, all-steel construction.
- (3) Insulation has all joints lapped and sealed in place, thus adding to the rigidity of the cabinet as a whole.
- (4) Exterior finish is elastic white enamel on parkerized steel.
- (5) Cabinet finished all around back as well as front. Back ventilating opening is provided.
- (6) Inside of door is one-piece white porcelain with blue-black porcelain border, wiped to prevent chipping.
- (7) Beautiful die-cast hardware, designed to harmonize with the cabinet, in butler chrome finish.
- (8) Flooded type cooling unit, of proved efficiency.
- (9) Condensing unit of standard Kelvinator construction, separate motor and compressor with belt drive.
- (10) Condensing unit mounted on a combination of coil springs and cushion rubber.
- (11) Accessible temperature selector with five freezing speeds, and separate defrosting switch, all part of the cooling unit assembly.

Note: Specifications will be forwarded upon request on the new Leonard Electric Seven Cubic Foot Cabinet. Do not forget to also consider this cabinet when planning on larger refrigeration requirements for modern large homes. Correspondence promptly taken care of.

New Line

Leonard offers the building trade an entire new line of refrigerator cabinets built for ice or the installation of electric or gas units (a combination set-up).

Description of All-porcelain Models with Two Doors**No. 0474**

Model No.	Pounds of ice	Width, in.	Depth, in.	Height, in.
0473	75	34 $\frac{5}{16}$	21 $\frac{3}{4}$	50 $\frac{3}{8}$
0474	100	34 $\frac{5}{16}$	21 $\frac{3}{4}$	53 $\frac{3}{16}$

Description of All-steel Models with Two Doors**No. 1474**

Model No.	Pounds of ice	Width, in.	Depth, in.	Height, in.
1472	50	33	19 $\frac{1}{4}$	45 $\frac{3}{4}$
1473	75	34 $\frac{5}{16}$	21 $\frac{3}{4}$	50 $\frac{3}{8}$
1474	100	34 $\frac{5}{16}$	21 $\frac{3}{4}$	53 $\frac{3}{16}$
2472	50	33	19 $\frac{1}{4}$	45 $\frac{3}{4}$
2473	75	34 $\frac{5}{16}$	21 $\frac{3}{4}$	50 $\frac{3}{8}$
2474	100	34 $\frac{5}{16}$	21 $\frac{3}{4}$	53 $\frac{3}{16}$
2476	150	34 $\frac{5}{16}$	26 $\frac{3}{8}$	53 $\frac{3}{16}$

Interior and exterior are of genuine porcelain. Insulated with 2 in. Leonard Approved Insulation. Hardware is of brass, triple nickel plated. Drain pipe and trap, made of copper, nickel plated. Deflector shield in the ice chamber. Daylight base. Bolts and holes with hanger bars in ceiling of ice chamber for convenient installation of electric or gas units.

Exterior, steel with enamel finish. Interiors, porcelain and white enamel. Hardware, brass, nickel plated.

Insulated with 1 $\frac{1}{2}$ in. Leonard approved insulation. Daylight base. Bolts and holes with hanger bars in ice chamber for installation of electric or gas units.

Nos. 1452, 1453 and 1454 have porcelain food chambers. Nos. 2472, 2473, 2474, and 2476 (four doors) have white enamel provision chambers.

Description of No. 2953

This model is in demand for large and small apartment multiple electric hook-up.

This cabinet is built especially for this kind of electric refrigeration and is of a size approved for such installations.

It is an all steel cabinet with white enamel lining and has Leonard Approved Insulation.

**No. 2953**

Model No.	Pounds of ice	Width, in.	Depth, in.	Height, in.
2953	75	25 $\frac{3}{8}$	18 $\frac{3}{8}$	42 $\frac{7}{8}$

Description of Commercial Cabinets

Leonard Approved Insulation in all cabinets. Double gaskets on all doors.

Flush type doors. Heavy durable hardware. Equipped for ice or electric refrigeration. Wire shelves, meat hooks, sliding wood shelves, revolving trays, can be had in models.

Nos. 9111 and 9314 have porcelain linings. Rest of cabinets have galvanized steel linings.

Products

REFRIGERATORS and COOLERS.

Also Display Cases for all purposes for either ice or machine refrigeration.

Material and Workmanship in McCray Refrigerators and Cooling Rooms

Suitable, seasoned and kiln-dried lumber is the

most important material entering into construction of any refrigerator or cooling room. All lumber is carefully selected and air-dried for six months or more before entering the dry kilns, wherein the curing process is completed to a precise degree. By proper steam and heat treatment the moisture content and shrinkage are reduced to a suitable minimum, and the lumber is under constant observation during the process. Successive, carefully conducted laboratory tests tell when the lumber has been sufficiently treated. The heat is then slowly reduced, the lumber is allowed to cool gradually to prevent checking and finally withdrawn ready for manufacturing.

The properly selected and prepared lumber is manufactured into McCray refrigerator and cooling room parts by special woodworking machinery, insuring accuracy of fit and interchangeability of all parts. The gluing, assembling and finishing of the units are accomplished by skilled workmen, under direct supervision of men who have spent a lifetime in the building of high-grade McCray refrigerators.

Efficiency from an operating standpoint is gained by the special method of building into the refrigerator structure the best known insulating materials. The permanency of the units depends on this method, which prevents the air infiltration through the insulated parts, thereby eliminating the danger of moisture accumulation between outer and inner linings. Airproofing of insulation in refrigerator and cooling room structures has always been an outstanding feature of McCray factory built units and is a recognized necessity to insure lasting and sanitary construction.

McCray quality is insured by advanced design and rugged construction in minutest detail, coupled with

efficient manufacturing methods in the hands of skilled and trained men in every department.

Service

This organization with its large facilities can serve you effectively through its many Branch Offices, located in all principal cities throughout the United States. Special engineering service is offered, and no obligation is incurred by consulting with us regarding your refrigerator problems. Our experience is at your command, and however small or large your installation may be, we are in excellent position to plan and execute your work in an economical and efficient manner.

Products

INSULATED DOORS for all purposes where temperature control is necessary. Two distinct types—"Jamison," with square jambs, double seals of contact and *extra* heavy hardware.

"Stevenson," with single contact seal (double seal optional) and heavy hardware.

STEVENSON VESTIBULE DOOR ("Door That Cannot Stand Open").

TRACK DOORS.

SUPER FREEZER DOORS (Overlapping type).

STANDARD COOLER DOORS.

ICE CHUTES, self-closing: "Noequal" All-steel Automatic; "Noequal" Platform Chutes; Stevenson Ice Passing Chutes. DOORS, MISCELLANEOUS: Double, Vertical Sliding, Auto-Close (Double-Swing Batten Doors), Dutch Track, Wicket.

REFRIGERATOR FRONTS: for built-in refrigerators.

CAN PASSING VESTIBULES.

WINDOWS: for refrigerated and insulated rooms.

Any of the above may be furnished fireproofed.

Swings the door clear of the opening. Furnished with ball bearings when specified.

In a test by engineers, a Jamison Door was thrown open and slammed shut for the equivalent of 85 years of service, at which point the test was discontinued as the door was still efficient in every respect and showed no signs of weakening.

Fig. 2. Jamison Spring Hinge

The Company and Experience

JAMISON COLD STORAGE DOOR CO. combines the largest and oldest manufacturers of cold storage doors—the Jamison Cold Storage Door Co., Inc., of Hagerstown, Md., and the Stevenson Cold Storage Door Co., formerly of Chester, Pa.

Their products, by an exclusive humidity control system, embody the scientific solution of the problems of shrinking and swelling of wood under refrigeration, the amount and character of insulation, the type of construction, and the hardware for long hard service—backed by experience since 1888 in all phases of refrigeration and temperature control.

Jamison Advantages

The best material obtainable is used. Employs double seals, forming a dead air insulating space between. Material is extra heavy, insuring the extra strength and stamina for which all Jamison products are noted.

Jamison Hardware

Weights 60 lbs. for the standard cooler door, and is bolted to the door and frame. Its extra weight and strength, with simplicity of design, make it practically indestructible.

Jamison Fastener

Patented Wedgetight Fastener is described and illustrated on following page.

The Jamison Automatic Self-tightening Fastener is of the roller type, especially designed to draw heavy doors tighter each time they are slammed.

It cannot rebound. Positive in action—holding door fast till the lever handle is released, from inside or outside.

Fig. 1

Jamison Adjustable Spring Hinge

Adjustable to force the door tight against its seals at all times regardless of shrinking or swelling of the door. A heavy steel bow spring exerts constant pressure against the heel of the door, providing spring tension adjustment (Fig. 2).

Stevenson Advantages

The best material obtainable, seasoned and held under humidity content control, is used. Employs a single soft gasket seal (double seal optional) which flattens out at point of contact. Equipped with hardware strong, serviceable and elastic.

Stevenson Improved Automatic Roller Fastener (Patented)

Fig. 3 (Patented)

An efficient roller type that operates positively, quickly and noiselessly and *does not* slacken or rebound as it latches. No wrist spraining kick when closing.

(Fig. 3) Roller latch "B," passing over nose of keeper "C," wedging into pocket "D" when the door

seals against frame, reaching locked position the instant the gasket seals are most tightly compressed. Operates with a straight pull outside and a straight push from inside.

Stevenson Self-adjusting Elastic Clamping Hinge

Consists of a strong spring tempered steel hinge-leaf riding on a hardened washer. Follows the yielding gasket at all times maintaining a tight seal. Bolted to the frame. Swings the heel of the door clear of the opening. Moves as easily as ball bearing hinges. Furnished with ball bearings when specified.

Fig. 4

Stevenson Hinge Guard (Patented)

A great rigid lower hinge-leaf plate applied on the face of the elastic hinge, protecting the door from all excessive strains, but not interfering with the clamping operation of the Spring Hinge-leaf.

Its oblong pinholes engage only when the strain makes extra strength necessary.

Fig. 5

Stevenson Improved Man Size Door Closer

Suitable for installing on any make of door. Saves refrigeration by keeping door closed.

A heavy coiled-steel spring, open wound to prevent clogging with ice and rust, encircling an actuating steel arm, is placed on the side casing of the hinge edge of the door, providing instant and positive closing.

Made in several sizes. In specifying, state size of door in clear, and whether right or left.

Actual comparative engineering tests have proved this closer superior to any closing device known, and we unqualifiedly recommend it. (Tests upon application.)

 Northern Electric Co., Montreal, Que., Canada
 University Club, Philadelphia, Pa.

Jamison-Stevenson Wedgetight Fastener (Patented)

A new straight push-and-pull type proving by actual usage an outstanding improvement in fastener operation. Has these outstanding advantages: (1) closes the door tighter, (2) keeps it tighter, (3) does not slacken as it latches—cannot rebound, (4) no moving part in operator's hand in closing—eliminates wrist-spraining kick-back, (5) *always* fastens tightly, (6) automatically compensates for wear, sag and twist of door, adding years to door's life, (7) few moving parts, (8) opens easier from outside or inside, (9) essential moving part bolted to frame.

A heavy spring driven wedge drives home *at the instant of impact* against the inner bar bolted to the door, *forcing* the door to compress the gasket seals always. Made extra heavy, conforming to Jamison standards of strength and durability.

Optional on Jamison Doors at no extra cost; on Stevenson doors at slight extra cost. Obtainable for replacements on any make of door at reasonable price. Also available in polished bronze, chromium plated, or with any other desired finish—prices quoted.

Made in four sizes—No. 1, for doors over 3x6 ft.; No. 2, for doors 2x5 ft. to 3x6 ft.; No. 3, for all smaller doors and windows—all opening from inside or outside; No. 30, for doors and windows up to 2x5 ft. opening from outside only.

Fig. 6

(Patents Nos. 1637168,
1752131)

Stevenson Vestibule Door, "Door That Cannot Stand Open," (Patented)

A combination of a Stevenson insulated door with two double acting doors forming an air lock (Figs. 7 to 10), obviating in most instances a vestibule with its accompanying loss of space. Flapper doors prevent outflow of cold air and inflow of warm moist air. Extremely desirable in busy doorways where heavy traffic means frequent opening of the doors. Is replacing many standard doors, beefhouse track doors, and freezer doors, with a marked saving in refrigerating costs and the elimination of mold-spotted goods and ice-coated pipes.

The double-acting armored batten doors, insulated, strike the unlatching bar (as shown in accompanying figures) on the inside of the cold storage door, releasing fastener and throwing that door open. Trucks go through without a halt.

Double-acting doors are pivoted on a two-way cam, operating in an oil reservoir at the bottom of the frame. Doors lift a little as they swing open, and close instantly by gravity. The flapper doors can come to rest only in closed position. Entire weight of double-acting door is carried by the heavy cam.

Any Jamison or Stevenson type (Standard Cooler, Super Freezer, etc.) either with or without overhead track rail, fire-proof or non-fireproof, can be supplied with these double-acting doors. The outside cold storage door supplied with Jamison or Stevenson Hinges and Stevenson or Wedgetight Fasteners.

* 73	5 0	6 6	Double batten	5 3 1/2	6 10 1/2	1000

*Includes extra hinges.
 Special sizes furnished where required.
 Blue prints furnished on request.

Details

Batten doors on all sizes will "bump" open outer insulated door.

All batten doors on Nos. 64 to 73 provided with peep holes (see Fig. 7).

Each batten door, opened at right angle, reduces clear opening 1 7/8 in.

Jamison Standard Cooler Doors

Standard Specifications—We furnish the insulated door hung in the frame, complete with all necessary hardware, galvanized, ready to set in place. For sills see Figs. 17-19.

Front: Raised panel front, best grade yellow pine.

Back: Tongue and groove, fir or spruce. No paint or varnish.

Insulation: Cooler, 4 in. granulated cork encased in paper. Freezer, 4, 6 and 8 in. cork board laid in hot asphalt. Other insulation as specified.

Fittings: Jamison automatic self-tightening fastener regular equipment, or Wedgetight Fastener optional if specified, and Jamison adjustable spring hinges. (See Fig. 1 and description.) Diagonally braced with wood or steel. Unbroken insulation.

Fig. 11. Jamison Standard Cooler Door
Right hand, raised panel front

Wall opening: must be 7 in. wider and 5 in. higher than door in the clear. When overhead rail is used wall opening must be 8 in. higher than top edge of rail.

*Includes extra hinges. In specifying or ordering state "Jamison" or "Stevenson," giving stock number. These same sizes are also standard for Regular Freezer Doors, and other types of doors, fireproof or non-fireproof.

Track Doors

All Jamison and Stevenson Doors can be furnished with track ports for overhead rails, and the necessary opening and closing devices.

Fig. 20 shows the Jamison and Fig. 21 Stevenson Automatic Trap Lift Devices. Track port opens and closes simultaneously with insulated door through a simple system of levers. No springs or delicate mechanism. Positive motion, both in opening and closing. Wall opening must be 8 in. higher than top of rail. Otherwise dimensions same as for Jamison or Stevenson Standard Cooler Doors, or Vestibule Door, as shown in respective tables.

Fig. 20

Fig. 21

Always give height from floor level to top of rail (usually 7 ft. 2 in. or 10 ft. 2 in.)

Stevenson Super Freezer Door for Icy Doorways (Overlap Type)

Of entirely different construction and design from other types of doors described; especially designed and recommended for use where extreme temperature differences exist, such as in ice cream hardening rooms, fish freezers, and quick freeze spaces.

The frame is usually built without jambs. (Can be furnished with jambs if desired.) The heavily insulated freezer door is made with 4, 6 or 8 in. of sheet cork in hot asphalt cement. Is usually protected on the exposed face (warm side) with sheet metal. A chemically treated, grease saturated, wool-felt seal, 6 in. wide, is attached to the flat face of the door, forming a non-freezing, ample contact preventing freezing or sticking fast to frame.

Equipped with heavy Stevenson Roller Fastener, or Wedge-tight Fastener, flexible steel spring hinges and hinge guard. Can also be furnished with Jamison Adjustable Hinges and Jamison Self-Tightening Fastener if desired.

POPULAR STANDARD SIZES

Stock No.	Size of door in clear		Wall opening			Ship. Wgt. 4 in. insulation, lbs.	General
	Width ft. in.	Height ft. in.	Without jambs	with jambs			
				Width ft. in.	Height ft. in.		
80	2 0	3 0	Same as	2 4¼	3 3	350	Unless otherwise instructed, galvanized sheets furnished on front of frame and back of door. For doors swinging into anteroom we will furnish galvanized sheets on front of door instead of back, when so instructed.
* 82	2 6	6 0	door	2 10¼	6 3	590	
* 84	3 6	6 0	in	3 10¼	6 3	670	
* 86	4 0	6 6	clear	4 4¼	6 9	750	
* 87	4 6	6 6		4 10¼	6 9	825	
* 88	5 0	6 6		5 4¼	6 9	875	

*Furnished with additional hinges.
Other sizes furnished when desired.

Fig. 22

Fig. 23

Insulated with 4, 6 or 8 in. insulation laid in hot asphalt

Fig. 24

Stevenson Ice Passing Chutes (Patented)

Fig. 25

Consist of small standard insulated door (optional) and self-closing, double-swing door operating by gravity on a two-way cam, same principle as Vestibule Door. No springs. Outside door opened from inside by the advancing cake of ice. Sets entirely in the wall, made so ice slides in or out on edge (as illustrated) or upright on end. Furnished with inclined or level bottom. Ideal for handling milk or ice cream in cans or boxes. Equipped with Stevenson Roller Fastener, Jamison Self-tightening or Wedgetight Fastener as desired. Either Jamison or Stevenson Hinges.

STANDARD DIMENSIONS

No.	Size in clear or Opening between jambs of frame		No. of battens	Shipping wgt., lbs.	
	Width ft. in.	Height ft. in.		With C. S. doors	Without C. S. door
120	1 8	2 2	Single	280	130
122	1 8	2 2	Double	260	140
124	1 8	4 0	Double	400	200

Regularly furnished with cold storage door on exit end as shown or without when specified. Door may be on entrance end when so ordered. Inclined bottom protected with steel wearing plate.

Jamison Can-passing Vestibule

A vestibule with a small standard insulated door at each end for passing cans to or from the hardening room. Enables one man to operate plant without help. Practical in passing all small packages.

DIMENSION TABLE

Stock No.	5-Gal. cans—size or capacity		Sh. wgt., lbs. Box not insulated
	Cans wide	Cans deep	
111	2	3	300
112	3	2	330
113	3	3	385

Wall openings vary with type, dimensions furnished upon request.

"Noequal" All-steel Ice Chute

Sides, top and bottom are boiler plate steel, properly reinforced. The curved steel door—counterbalanced—built up of 1 $\frac{1}{2}$ -in. pure corkboard protected with sheet steel, the whole bolted together. Felt seals on the sides and bottom of door make airtight contact. "Noequal" Chute requires about 2 $\frac{1}{2}$ in. to 1 ft. less space in width than other chutes, and on the doubles and triples only $\frac{1}{8}$ in. of space between blocks, enabling them to be used at bottom of ice elevator shafts, or where the can dump is close to the wall.

Fig. 26

POPULAR SIZES

Stock No.	300 and 400 lbs. block on edge	Wall opening		Sh. wgt., lbs.
		Width ft. in.	Height ft. in.	
126	Single.....	1 2 $\frac{1}{2}$	3 1	325
127	Double.....	2 3 $\frac{1}{4}$	3 1	565
128	Triple.....	3 4 $\frac{1}{2}$	3 1	785
129	Quadruple.....	4 5 $\frac{3}{4}$	3 1	1030

Incline bottom standard (level bottom optional).

Noequal Platform Chutes—Combined chute and standard cold storage or vertical sliding cold storage door on exit end, single or multiple openings, write for complete catalogue data.

Jamison Vertical Sliding Door (Figs. 27 and 28)

Insulated and counterbalanced on galvanized steel cable and roller bearing sheaves. Rubber contact-seals all around making it airtight, yet it slides with complete freedom.

POPULAR SIZES

Stock No.	Door in clear wall opening same size (Fig. 28)		Sh. wgt. with 2-in. corkboard insulation,* lbs.
	Width ft. in.	Height ft. in.	
90	2 0	2 6	260

Other sizes furnished when required. Can be used with conveyors. Information and dimensions on request.

*Insulation 2 in. corkboard.

Fig. 28

Fig. 27

Jamison Sanitary Door

For use by hospitals, public institutions, restaurants, hotels, etc., where the sanitary feature is desired. Not recommended for freezers.

Embodies standard Jamison or Stevenson Cooler Door construction and insulation except for its smooth laminated panel front. Special types of hardware, finished as desired to meet individual requirements. For wall opening, see table on the preceding page of Jamison and Stevenson Cooler Doors.

Other Jamison and Stevenson Products

Catalogue describing other products, such as refrigerator fronts, Dutch doors, cold storage windows, etc., gladly sent on request.

For variations of above or special protection to meet local conditions, we invite you to consult our Engineering Department of 33 years' experience.

VICTOR PRODUCTS CORPORATION

FORMERLY VICTOR COOLER DOOR CO., INC.

"Standard" Refrigeration Products
HAGERSTOWN, MD.

NEW YORK, N. Y.

CHICAGO, ILL.

Products

REFRIGERATION DOORS:

Victor "Standard" Cooler Door.

Victor Auto-Close Vestibule Door.

Victor "Super" Freezer Door.

Victor "Standard" Track Door.

Special Milk Can and Case Passing Door.

Special Refrigeration Doors to suit your requirements.

VICTOR ICE CHUTES; VICTOR STANDARD HARDWARE.

Also Victor All-metal Door, Victor Fireproof Cold Storage Door, Victor "Standard" Windows, Mortuary Doors and Service Fronts, Victor "Standard" Waterproof Gaskets.

For Victor Steel Shelving, see Manufacturers' Index.

Victor "Standard" Cooler Door

The Victor "Standard" Cooler Door is furnished with angle iron, beveled oak or high sill.

Insulation—Granulated cork, corkboard (4 or 6 in.) laid between 3-ply waterproof paper.

Where corkboard is used in freezer doors, it can be laid in hot asphalt at small additional cost.

Hardware

Our Standard No. 200 Roller Fastener, as shown, is constructed of malleable castings and forged steel, galvanized by the hot dip process. Single action—easy to operate. Just pull lever forward and this one operation releases latch and operates door. Entrance doors equipped with single acting inside control.

Lumber—Panel door fronts and casings best grade yellow pine; high grade spruce or fir for backing, jambs and stiffeners.

Victor "Standard" Cooler Door

VICTOR "STANDARD" DOOR SIZES, ETC.

No.	Standard size	Approximate weight, lb.
x	2'0" x 2'0"	160
xx	2'0" x 2'6"	200
xxx	2'0" x 3'0"	220
xxxx	2'0" x 4'0"	240
1	2'0" x 6'0"	350
2	2'6" x 6'0"	390
3	2'6" x 6'6"	440
4	3'0" x 6'0"	450
5	3'0" x 6'6"	450
6	3'6" x 6'0"	460
7	3'6" x 6'6"	500
*8	3'0" x 7'0"	500
*9	3'6" x 7'0"	540

*14	4'6" x 7'0"	640
*15	5'0" x 6'6"	650
*16	5'0" x 7'0"	675

*Includes three hinges.

Brace—Iron, securely bolted in tension, with four large bolts, eliminates any possibility of joints opening. Frost line is avoided by completely covering the brace with insulation.**Shipping**—All doors shipped hung in frames, complete with hardware, ready to set in place.

Auto-Close Vestibule Door

The illustration shows door in action with truck opening

Auto-Close Vestibule Door

ing door as it passes through. Angle iron sill for concrete floor (also made with wood sill). Note the corkboard insulation in frame head over door. The Auto-Close Door is of the same standard construction as the "Standard" Door.

The Standard Victor Auto-Close Vestibule Door eliminates the necessity of building air locks, which are expensive and consume valuable storage space.

The Standard Victor Auto-Close Door will not stand open. This feature prevents the loss of refrigeration so frequently incurred by leaving doors

open, as is natural when hurried trips are made in and out of the freezer room. It is difficult indeed to estimate the losses during these periods; although of short duration, they will accumulate into a tremendous loss.

The bar on back of hinged door eliminates any possibility of being locked in the freezer, as it is only necessary to give swinging doors a push or bump with a truck which brings them in contact with hinged bar, that in turn operates the fastener. The Auto-Close Doors are practically indestructible. Bumping with trucks will not injure them.

The working drawing of the "Standard" Door on following page applies to the Auto-Close Vestibule Door as well, except that the wall opening should be 7 in. wider and 10 in. higher than door in the clear.

Victor Standard Hardware

Lock No. 200 is used on all Victor "Standard" Cooler, "Super" Freezer, Auto-Close Vestibule and all the larger doors.

It is finished either polished brass, nickel or galvanized.

This lock is a one-motion single-action lock; just pull the handle towards you and this releases the lock, at the same time opening the door.

Victor "Standard" Door Construction

Note the method of paneling Victor Door Fronts, and of insulating and bracing the doors.

The cross rails are mortised and tenoned in the stiles and pinned with iron dowels from the back.

The iron brace is sufficiently strong to prevent sagging and is surrounded with insulation which prevents the door frosting through.

The Victor Standard method of bracing is patterned after bridge construction and has proven efficient in many years of use.

Victor "Standard" Track Door

Made of the same materials and in the same sizes, with the same general specifications as the Victor "Standard" Cooler Door.

The Victor "Standard" Track Door is especially suited for use in packing houses where the meat or articles passed to and from storage are carried on tracks.

The working drawing of the "Standard" Door above applies to the "Standard" Track Door as well, except that the wall opening should be 7 in. wider and 10 1/2 in. higher than door in the clear.

Victor Standard Trap
Lifting Device

Victor "Super" Freezer Door

The Victor "Super" Freezer Door was designed especially for hardening rooms, etc. where it is desired to maintain an extremely low temperature or where on account of conditions ice would have a tendency to form in the doorway. This door cannot freeze in the frame and never needs to be cut or forced open.

The working drawing of the "Standard" Door on preceding page applies to the "Super" Freezer Door as well, the only exception being the wall opening which is 4 in. wider and 3 in. higher than door in the clear.

Victor "All-steel" Ice Chute

Victor "Standard" "All-steel" Ice Chutes are constructed of steel plates and angles of proper proportions, with patented curve door, cork insulated and carefully fitted with waterproof gaskets at points of contact. Door is pivoted on cold rolled steel shaft carefully balanced and requiring no springs to operate. No wood is used in the construction and all joints, including door joints, are riveted or welded. There are no bolts to work loose.

When a block of ice enters the opening, the top forward edge comes in contact with the curved door, which is so balanced that but little force is required to open door. This eliminates broken corners on blocks of ice.

The door and other exposed parts are insulated with corkboard. The Victor "Standard" "All-steel" Ice Chute will last indefinitely.

Victor "All-steel" Ice Chutes are also made with cold storage door on the discharge end if so desired. All bottoms are made slanting unless otherwise specified, eliminating the necessity of a man pushing the blocks of ice through.

The curved door strikes on waterproof gasket securely fastened to angle iron riveted to side of chute with curve corresponding to curve of door. The weighted flapper on point of door completes the seal. This is an *exclusive Victor feature*.

It is far more practical to use this standard Victor "All-steel" Ice Chute than any door you can buy or build. A greater quantity of ice can be handled through a Victor "All-steel" Ice Chute than through a door. You also have the advantage that the chute does not stand open waiting for some one to close

it, as compared with a door. A Victor "All-steel" Chute is always closed and the loss of refrigeration is negligible. This eliminates the chance of careless employees leaving hinged or sliding door open for short or long periods, during which time the cold air would be wasted.

Note: The block of ice fills the opening so that practically no cold air escapes while passing. Door automatically closes behind ice block in one second, reducing temperature loss to a minimum.

Provide wall opening 19 in. wide by 39 in. high for single chute. The Victor Standard Ice Chute can be furnished either single, double, or in batteries to suit these specifications.

Victor Milk Can or Case Passing Door

The Victor Milk Can or Case Passing Door was developed to meet a demand for an automatic closure for passing milk cans and cases, without upsetting. Before this door was developed it was necessary to use an ordinary hinged or sliding door that could easily be left open for indefinite periods, involving a tremendous loss of refrigeration.

The Victor Can or Case Passing Door is so sensitive that it closes a fraction of a second behind each entry. The roller bottom operates in unison with Victor gravity conveyor both to and from the door.

The Victor Milk Can or Case Passing Door is furnished for walls 12 in. thick unless otherwise specified. Hinged door hung either left or right hand. The clear opening necessary for this door is 18 by 31 in. and the wall opening 25 by 41 in.

Victor Standard Hardware

Lock No. 40 is supplied on all passing doors, windows, refrigeration fronts, etc., where a small, quick acting lock is necessary. The illustration shows the lock not engaged.

Estimates, etc.

When writing for quotations or ordering, please supply all the information that you possibly can, including:

(1) Size of door. (Use stock sizes where practicable.) The various standard sizes are listed on the second preceding page. Unless otherwise specified, 4-in. granulated cork will be furnished.

(2) State specifically what character of door.

(3) Give approximate temperature, both inside and outside of door.

(4) Kind of insulation preferred.

If you will advise purpose for which door is to be used we will be glad to offer suggestions as to the most practicable insulator.

(5) Give all dimensions necessary, see tracing.

(6) Specify whether right or left-hand door is wanted. Unless otherwise specified, we will ship right-hand door.

(7) Kind of sill. See tracing.

(8) Finish of hardware: galvanized, nickel, polished brass.

(9) Track doors; please specify height to bottom of track rails. This is very essential.

CORK
and
INSULATION

UNITED
CORK
COMPANIES

Lyndhurst, N. J.

ference in temperature per 24 hours or .267 B.t.u.'s per hour.

We think we are meeting the efficiency issue thoroughly when we unequivocally guarantee that United Corkboard (100% Pure Cork) is unexcelled in quality or efficiency by

United Corkboard Insulation (100% Pure Cork)

any other insulating board on the market.

United Corkboard (100% Pure Cork) is manufactured in standard sized boards 12 in. wide by 36 in. long, and in various thicknesses. (See table on page 5.)

USES OF CORKBOARD

The common uses of corkboard may be divided into six distinctive classes, as follows:

(a) Refrigeration—The principal uses under this class of work include insulation for cold storage buildings, refrigerated rooms, tanks, etc.; ice making plants; ice skating rinks, etc.; and refrigerators and refrigerated plants of all kinds.

The characteristic use of cork for such work, is the prevention of heat transmission where the maintenance of low temperatures is required.

The insulation of buildings against the heat of the sun and atmosphere, to provide comfortable habitation in summer, would incidentally come under this heading.

(b) Conservation of Heat—Insulation against the loss of heat covers various uses almost too numerous to mention but broadly speaking it includes all forms of insulation which prevent the escape of heat required for any heating purpose including the heating and ventilating of buildings in which economy of fuel is usually the objective. The characteristic use in this case is the prevention of heat loss.

(c) Prevention of Moisture Condensation—This class of use covers any case where neither refrigeration nor heating is the essential consideration but where damage from condensed moisture would be the difficulty to overcome. In this case the use of cork on roofs, walls, pipes, ducts, etc., accomplishes entirely satisfactory results in the most economical way. The purpose of cork insulation in this case is to prevent moisture laden heat from condensing into water upon cool surfaces.

As hereinafter mentioned, we have published a booklet on Roof Insulation which fully treats of this subject and we will gladly send it on application.

(d) Acoustics—Acoustic corrective treatment in rooms and auditoriums and soundproofing and sound-deadening are allied subjects under acoustics, and while often closely related they are also often distinctive. Acoustics concerns itself with the auditory properties of rooms, offices, auditoriums, etc.

Progress is being constantly made in the science of acoustics in which the use of cork is ever increasing. Research, experiment and actual use reveal that there is no material so versatile as cork in corrective acoustic treatment. Cork possesses unique properties in that it may, in various forms, be used to diffuse, reflect, absorb or reinforce sound. It provides a medium which

may be said to sensitively control sound, permitting different forms of correction for different zonal acoustic defects.

No problem in acoustics should be considered settled without considering the use of United Acoustic Corkboard.

Soundproofing and sound-deadening while intimately connected with acoustics are often distinctive subjects. Specifically, they have to do with sound penetration and sound absorption in numberless forms in various types of construction.

The battle against objectionable noise is being waged persistently from every possible angle. Soundproofing and sound-deadening for a very wide variety of uses are now regarded as of such importance that no architect would be justified in neglecting them, particularly for such buildings as banks, hospitals, apartments, offices, subways, overhead railroads and roadways, railroad terminals, depots, etc., and for sound-deadening in connection with machinery, etc. Cork for these uses is invaluable.

Our organization is thoroughly expert in these subjects and is keeping fully abreast of all developments in the science of acoustics in all its branches. We invite consultation on any problem dealing with this subject.

(e) Vibration Absorption—This use, while similar in some respects to sound-deadening is, nevertheless, frequently not associated with it. It is often desired to prevent the transmission to structures of the vibrations caused by machinery, which are known to cause fatigue and nervous disturbance to workers, resulting

in their discomfort and inefficiency. Of equal importance is the fact that such vibrations are often seriously injurious to the vibrating apparatus itself and the importance of the subject is therefore twofold. We manufacture a particular cork product called Crescent Machinery Isolation Corkboard which is not surpassed for this purpose.

(f) Flooring—In many respects cork provides the very best material for flooring purposes. In fact, it can be safely said that no other material offers quite so many advantages for this purpose. It is soft underfoot, noiseless, insulates against cold, and is durable. Even for the most severe uses the proper type of cork flooring will insure entirely satisfactory results.

Miscellaneous—Information in regard to the above uses and many other uses will be found in the succeeding pages.

Installing United Isolation Corkboard on Overhead Roadway Through New York Central Railroad Office Building, New York, N. Y.

ADVANTAGES OF CORKBOARD

The outstanding features which combined make cork the best and most economical form of insulation for all refrigerating plants are:

First—It provides the *maximum amount of insulation efficiency* because of its cellular structure. Each granule of cork contains thousands of small hermetically sealed air cells. The air is trapped in these cells, is consequently non-circulating, and therefore this particular construction approximates a vacuum—the highest type insulator—more closely than any other insulating material.

Second—It allows *compact construction* that occupies a

minimum of space, thus assuring increased storage capacity. That this saving of space is a factor of greatest importance is indicated by records kept of investment costs of cold storage buildings. These costs show a variation of from 45¢ to 60¢ per cu. ft. for land, building and insulation, depending upon location, exterior decoration, percentage of freezer space, etc.

Third—United Corkboard insulation remains *permanently efficient*. It has no capillarity. It resists moisture, hence undergoes no alteration in its insulation properties.

Fourth—It requires *no expense for repairs*. Once erected in a proper workmanlike manner it will stay put and last as

long as the building itself (unless structural defects appear in the building materials or in the building proper, to cause failure of the insulation).

Fifth—It is *free from odor and absolutely sanitary*, being non-absorbent, germ and vermin proof, and not subject to decay. These features are of greatest importance in rooms or buildings where perishable products such as milk, butter, eggs, meats, etc., are stored, because these products are readily affected by or are subject to contamination.

Sixth—United Corkboard applied directly to the surfaces and finished with $\frac{1}{2}$ -in. thick cement plaster or $\frac{3}{8}$ -in. United Sealite Mastic Finish is the only form of cold storage insulation that *provides an actual fire protection*.

MODERN WAREHOUSE INSULATION

Section opposite illustrates present day type of cold storage building construction. The building was designed for one of our largest cold storage warehouses. It is of the so-called mushroom type, reinforced concrete construction, enclosed with brick curtain walls. These walls are supported by a concrete wall beam extending between columns at each floor line.

The inside face of walls was coated with $\frac{1}{2}$ -in. Portland cement plaster, treated with Par-Lock to air-proof and dampproof the walls. The insulation was then erected against these Par-Locked walls in hot asphalt. United Sealite Mastic was used for the interior finish on the face of the cork.

Attention is called to the fact that each floor is insulated. This permits flexibility and economy in operation by enabling any room to be out of use without necessity of refrigerating it. First cost is so reasonable for insulating each floor slab that it is advisable to have this done in the beginning. All floor levels can then be satisfactorily established whereas if floor insulation work is delayed until later date countless troubles arise on account of levels, etc.

Bands (or ribbons) of cork are provided around the perimeter of the building as well as around elevator shafts, stairwells, etc., against the under surface of the ceiling slabs. These effectively block loss of refrigeration which might otherwise take place through the bottoms of the floor slabs. All exterior wall columns, caps and flares are also insulated.

The interior columns in the freezers are insulated from the floor line up to the bottoms of the flares to prevent transmission of heat through the column shaft. The second floor interior columns which occur over the uninsulated spaces of the first floor are insulated 6 ft. up from the floor line, for the same reason.

MATERIALS USED IN CONSTRUCTION

Nails, Discs and Skewers—Galvanized wire nails or wood skewers should always be used in erecting corkboard insulation. Common wire nails are useless as they will rust away.

Where corkboards are secured together, wooden skewers may be used. They are preferred by some engineers on account of being better non-conductors as compared to nails. Skewers should be made of hard wood $\frac{3}{8}$ in. thick and $\frac{1}{2}$ in. longer than the two thicknesses of corkboard.

Special galvanized wire nails called for in our specifications are made of small gauge to reduce the amount of metal and with extra large flat heads to give them more holding power.

When two courses of corkboard are erected to under side of wood framed and wood sheathed ceilings, first course nailed and second course erected in cement mortar with plaster finish, it is advisable to use galvanized iron discs of about 24-gauge and $1\frac{1}{4}$ -in. diameter for securely holding first course in place.

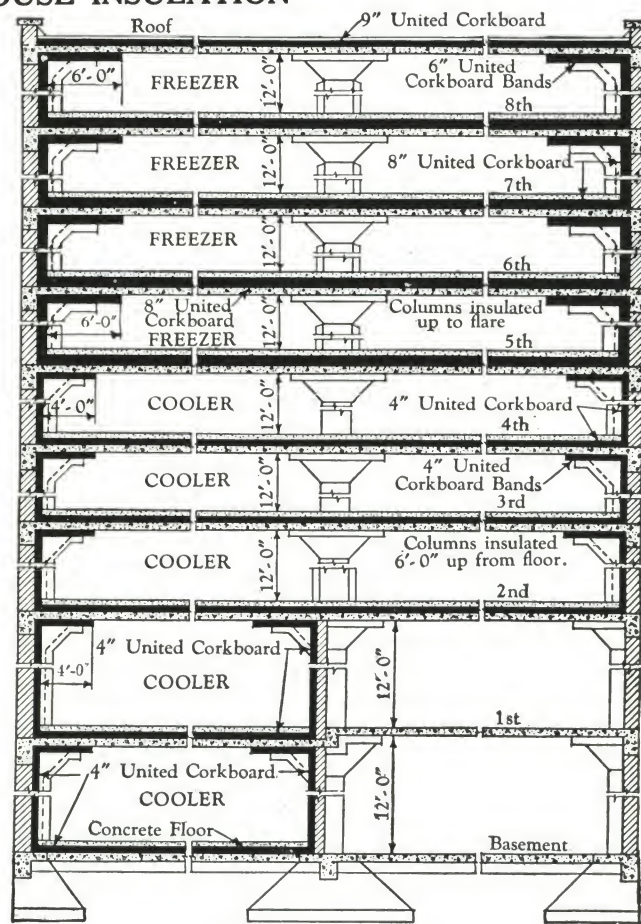

There is considerable weight to cement mortar and plaster finish which might be sufficient to pull the first course of corkboard over ordinary nail heads. Two or three special nails and one disc to each square foot of surface is all that is necessary.

Asphalt—Corkboard which is erected against walls in hot asphalt must be thoroughly coated with this material either by brushing asphalt on, or by dipping sheets of corkboard in hot asphalt. The characteristics of hot asphalt should approximate asphalt used in the Par-Locking of walls (Page 6).

Seventh—It has *superior structural strength* as compared with any other insulator. It can be used for the erection of partitions without any other supports; can be laid in floors carrying heavy loads without risk of deflection and can be built up the same as brick, also sawed, trimmed, and nailed the same as lumber.

A competent mechanic having some knowledge of cork can erect it, although we are convinced that money will be saved by placing the contract with us for *complete installation*.

Eighth—Corkboard is *the most economical insulation* that can be used when efficiency and permanent service are considered.

CROSS SECTION OF
MODERN COLD STORAGE BUILDING

In the selection of a suitable asphalt, there must be considered the following:

(a) The proper degree as to melting point. (b) Correct penetration (hardness or softness). (c) Proper ductility (stretch or yield without fracturing).

Paraffin base asphalts should always be avoided.

It has been a common practice until recently to use but one kind of asphalt for all types of construction, no matter whether the cork was to be laid on floors or roofs, or applied against walls. It is obvious, however, that an asphalt suitable for laying cork on floors would not necessarily be adaptable for applying cork against walls where much greater differences in temperature as well as stress have to be considered.

To insure permanence of the installation, the asphalt for walls should therefore be comparatively higher in melting point and relatively high in penetration and ductility; i.e., its characteristics should be such that it will not soften or run in the warmest summer temperature and still be sufficiently ductile to stretch or yield without fracturing in the coldest winter or cold storage temperature. In addition to these it must still hold the corkboard firmly in place. We have therefore made it a practice for many years to use a different grade of asphalt for wall work than that used for floors. The excellent results gained in our many large installations of corkboard conclusively prove that the asphalts we use possess the requisite properties for making permanent and efficient installations of corkboard.

GENERAL RECOMMENDATIONS AND SUGGESTIONS

In designing the proper insulation there are several factors to be considered which are likely to be different in every plant. They are:

(1) The temperatures to be maintained in the refrigerated rooms as well as the temperature outside surrounding the cold rooms.

(2) Climatic and atmospheric conditions.

(3) The kind of building, whether frame, brick, stone or concrete. (Hollow building blocks and tile construction should be avoided).

(4) Thickness of walls, ceilings and floors to which the insulation is to be applied.

(5) The kind of goods to be stored in the rooms.

(6) The cost of producing refrigeration.

Subject to these factors we have compiled the following tables giving thicknesses of corkboard that should be used for the various temperatures indicated. Under ordinary conditions these thicknesses have been found to give most economical results.

THICKNESSES OF UNITED CORKBOARD

For Rooms or Buildings					
Range of temperatures in storage areas	Walls, in.	Ceilings, in.	Floors on ground, in.	Floors above ground, in.	Roofs, in.
Below —15° F.	8	8	7	8	9
—15° F. to —5° F.	7	7	6	7	8
—5° F. to 10° F.	6	6	5	6	7
10° F. to 25° F.	5	5	4	5	6
25° F. to 40° F.	4	4	3	4	5
40° F. to 50° F.	3	3	2	3	4
50° F. to 60° F.	2	2	..	2	3
60° F. and above.	2	2	..	2	2

For Freezing Tanks					
If placed on foundation laid on ground, in.	If placed on floor above ground, in.	If placed directly over refrigerated rooms, in.	Granulated cork only, in.	Granulated cork and corkboard combined, in.	
				Gran. cork	Corkboard
Minimum, 5....	5	4	8	3	4
Preferably, 6....	6	4	12	4	3

0° F. to 10° F.	5	5	5
10° F. to 25° F.	4	4	4
25° F. to 45° F.	3	3	3
45° F. to 55° F.	2	2	2
55° F. and above.	1½	1½	1½

ERECTION OF CORKBOARD

Walls—There is taking place through the walls of most buildings a process called "breathing in of air." This is caused by the difference in air pressure between the cold interior of the room and the outside atmosphere. Where this occurs, air laden with moisture will be carried in through the walls and deposited within the cork insulation, destroying in time its insulating value.

This "breathing in of air" is a well known condition. It is aided by porous building material and it is of great importance to stop it, so that the insulation will give its maximum efficiency. Our aim should therefore be to airproof building materials as effectively as possible.

Theoretically, the outside of the building is the proper place for an airproof coating, and it is logical that the treatment should be applied there, but it is seldom practicable. We therefore have the alternative of coating the inside surface of the wall with a material which will assure both airproofing as well as the waterproofing of the surface.

To accomplish this all inside surface of walls should be "Par-Locked." This is a method of air and waterproofing which has been demonstrated to be the most highly efficient for use in connection with cork insulation; it is more particularly described on Page 6 of this catalogue.

After Par-Locking the walls, the cork insulation should be applied in two layers; the first layer in a bed of hot asphalt, and the second layer erected against the first layer also in a bed of hot asphalt. The interior should then be given a finish of either United Sealite Mastic or Portland cement as conditions require.

Ceilings—Insulation should preferably be laid on top of ceiling slabs whenever practicable. In one-story buildings, ice storages and other buildings of this type, slots may be left around the edges of the slab or ceiling construction to permit the insulation on the walls to pass between the walls and ceiling and tie in with the insulation laid on top of the ceiling.

Where the above type of insulation is precluded by the construction of the building, if it is a new building, the insulation should be laid directly in the ceiling forms when a concrete slab is used.

When the insulation is laid on top of ceiling slab and no slots are provided to permit connecting it with the wall insulation,

the underside of the slab adjacent to walls should be insulated with a band of corkboard as shown in section on page 12.

In cases where no provision has been made for slots to permit insulation to pass between walls and ceiling construction, and in cases where the insulation can not be laid on top of the ceiling, it is usually necessary to erect the insulation directly against the underneath side of the ceiling construction. Care should be taken to see that this insulation is erected securely.

When corkboard is erected against the underside of ceilings, its exposed surface should be given a finish of United Sealite Mastic or Portland cement plaster.

Where wood framed ceilings of rooms located directly under attics or ventilating lofts are insulated from the under side, the joists should be left open on top and where ceilings are insulated from the top side or floor above, the under side of joists should not be sheathed over, but left exposed.

By leaving the joists exposed to circulation of air dry rot or damp rot will be retarded.

Columns, Beams and Girders—It is just as necessary to insulate and protect columns, beams or girders as any other part of the building. Particular

attention should be given to columns in the lowest floor if the temperatures maintained are below freezing. The earth around the base of unprotected columns will freeze and expand to such an extent that serious damage to the building itself may occur.

Roofs—Adequate roof insulation is of still greater importance than that of floors or walls. Roofs are the greatest exposure of any building. Walls with northern exposure receive little or no sun; walls facing east, south or west may be exposed for several hours, but the roofs get the full effect of the direct rays of the sun all day long. Roofs, therefore, always should receive at least 1 in., but preferably 2 in., more corkboard than walls. Where roofs require protection against moisture condensation only, one course of 2 in. thick corkboard will usually suffice.

We have prepared a booklet on Roof Insulation describing the best methods of eliminating condensation and reducing heat loss through the roofs of buildings. We will gladly send copies of it to anyone interested.

Installing United Corkboard (100% Pure Cork) on Roof of Schering & Glatz Building, Bloomfield, N. J., to Prevent Condensation and Heat Loss

Cork Partitions—Cork partitions have remarkable strength, but are not intended to carry loads. This type of construction is recommended for forming walls of coolers not occupying the entire story of a building, or for making divisions between rooms. No studding or reinforcing other than the cement mortar core of plaster is required, excepting wooden frames at door or window openings. Where it is desirable not to build coolers to the full height of the story in which they are located, and it is found impracticable to suspend a ceiling from the floor above, the cork partitions may be reinforced with tee irons or wood studding to carry the weight of the roof or ceiling.

Coil Lofts or Bunkers—In many lines of trade, for example, meat packing, the desired temperature and necessary air circulation can only be obtained if the coolers are equipped with coil lofts or bunkers. They induce and promote air circulation. If the floors and curtain walls of bunkers are insulated, the rate of circulation will be increased and besides, condensation of moisture will be prevented on the under side of the bunker floor.

Floors on Ground—The importance of insulating ground floors is now generally recognized. The temperature of the ground is about 55° F., and remains fairly constant the year round. It is, therefore, of equal importance to insulate a floor on the ground as it is to insulate the walls or the ceiling. Not only will there be a great saving of refrigeration, but unless the floors of freezing rooms are adequately insulated the ground will freeze gradually and may cause an upheaval of the floor or even a derangement of the building's foundation. For this reason freezers with temperatures below 25° F. should always be located in the upper stories of a building.

Freezing Tanks—Freezing tanks should always be well insulated. The economical ice making capacity will be increased considerably if the bottoms and sides of tanks are insulated with the thicknesses given in the foregoing table.

Particular care for ample insulation should be given to the bottoms when placed on the ground. There are numerous cases on record where the bottoms of freezing tanks improperly insulated were forced up by frost to such an extent that the tanks became useless and had to be replaced at considerable expense.

Par-Locking

Failures of insulation begin because of improper contact between the corkboard and the surfaces against which it is applied. This is largely due to the fact that brick, tile, concrete, etc., against which corkboard is usually erected are porous materials.

Extensive research carried on over a period of years has shown that if the structural surface is properly coated with a sufficiently heavy layer of asphalt of permanent ductility and proper penetration (the process called Par-Locking) the following results are secured:

The ductile body of the asphalt used in the Par-Lock process equalizes the difference of expansion and contraction between the structural surface and the backing in which the corkboard is erected, thus preventing failure of the backing.

The suction of the structural surface is entirely removed, assuring full development of the entire strength of the backing (either Portland cement mortar or asphalt) while it is setting up.

The poorly formed bond between the structural surface and the backing (which has always been the weakest point in the application of corkboard) is mechanically overcome, because all detrimental surface voids of the structural surface are entirely eliminated, permitting perfect adhesion of the backing to the Par-Lock.

The action of efflorescence from the structural surface is stopped. This otherwise would weaken the grip of the backing.

In addition to the above, a positively tightly sealed wall surface stops all infiltration of air as well as moisture.

This process consists of coating the structural surfaces against which the corkboard is to be erected, with pure mineral asphalt, applied cold under gun pressure, evenly driving the asphalt into the surfaces, filling and sealing all pores.

The material used in Par-Locking walls is pure asphalt of about 210° r.m.p. which has no tendency to creep or buckle off the wall surface in warm weather. No coal tar pitch or low grade asphalt is used in the Par-Lock bond.

However, we wish to emphasize the fact that in order to obtain best results it is essential that the structural surfaces against which corkboard is to be erected with Par-Lock bond, are reasonably level. If there is unevenness, the surfaces should be first leveled up with a coat of Portland cement mortar, so that when the Par-Lock bond and corkboard are erected, there will be a smooth and even surface against which the corkboard may be stuck, thus leaving no chance for voids. Otherwise there remains the danger of an insufficient bond.

The backing in which the corkboard is erected is homogeneously tied to the structural surface with an adhesive strength several times greater than the tensile strength of the corkboard itself.

The method of Par-Locking serves to waterproof the insulation to a greater degree than any other method yet developed, as has been demonstrated by installations made as long as twelve years ago. We were the first to employ this method. It has since been adopted by all leading architects and engineers. Nearly all important modern cold storage plants are now insulated with walls airproofed and waterproofed by the Par-Lock method.

Par-Lock—One of the greatest improvements of all times for erecting insulation—is exclusively a "United Service" development.

Portland Cement Plaster

Portland cement plaster is the most durable finish over corkboard insulation on walls or ceilings of rooms where moisture conditions are not severe. It will, however, develop shrinkage cracks to some extent.

It should be scored off in squares of not over 5 ft. to minimize cracking. Cracks, however, will appear, but usually in the score marks. While these cracks do not impair the efficiency of the insulation it is well to point them up with a filler.

Portland cement plaster affords a hard, clean, sanitary finish for rooms where edible products are stored. It may be readily washed and it contains no irregularities or crevices where food particles may lodge and decay or rot. It thoroughly protects the insulation against damage from knocks and jars.

In many plants, especially where there is much trucking or moving of cased goods, etc., Portland cement plaster finish for walls is the very best material which we can recommend. However, where moisture conditions are severe and for ceiling work of many kinds, United Sealite Mastic is recommended in preference to Portland cement plaster. It is considerably lighter, sticks to the corkboard more tenaciously, does not check or crack like plaster, and affords a lighter and more waterproof ceiling finish for coolers of every description.

United Sealite Mastic

In ice storage rooms; cold storage rooms where doors are opened frequently; chill rooms in packing houses into which warm meats are placed to take out the animal heat; sweat rooms; coil bunkers, etc., moisture conditions are very severe.

Realizing that insulation must be properly protected on the interior from moisture as well as from the exterior, we have developed

A. Brick Wall. B. Par-Lock. C. United Corkboard (100% Pure Cork). D. United Sealite Mastic Finish

United Sealtite Mastic which is a moistureproof and airproof material applied cold directly on to the surfaces of the corkboard.

United Sealtite Mastic consists of an asphaltic base material and may be applied without the aid of heat or asphalt solvents. This is made possible by emulsifying the asphalt, i.e., the breaking up of it into minute particles suspended in water. Asphalt emulsion is one of the most important of recent process developments in the industry.

The water used in the emulsifying process acts both to keep the asphalt particles apart, and as a vehicle by means of which the asphalt or finished mastic may be spread on to the cork. Thus the mastic may be applied to the surface of the corkboard with a trowel and be

readily and smoothly worked. Any experienced plasterer can apply our Sealtite Mastic on to the corkboard just as easily as he can apply Portland cement plaster.

After the mastic has been applied, the water evaporates, the asphalt particles flow together and unite and form a continuous sheet of waterproof and airproof coating over the entire surface of the corkboard. There are no joints or cracks to be filled with a foreign material. Ultimate peeling and falling out of filler strips is eliminated and smooth, even appearances can be given to the room.

Where a color is desired, other than the natural gray black of our United Sealtite Mastic, we are in position to furnish and apply especially prepared paints with which the mastic may be given any desired color finish.

CRESCENT CORK COVERING

Crescent Cork Covering is a most efficient and economical insulation for brine lines, ammonia lines, ice or cold water lines, and special cold lines of every kind. It is manufactured of pure, clean, granulated cork, compressed and moulded in sectional forms to fit the various sizes of pipe. The fitting covers are moulded to conform to the shape and size of the various fittings in ordinary use. It is finished with a coating of mineral rubber that provides a waterproof covering for all lines and fittings. The insulation is applied with waterproof cement on all joints, which further assures covering that is impervious to moisture.

Crescent Cork Covering Provides—(1) Maximum insulating efficiency. (2) Permanent and durable insulation. (3) Neat, clean and sanitary covering. (4) A sav-

ing of at least 80% of the refrigeration lost from bare pipes. (5) An easily applied covering at a moderate cost.

Thicknesses—*Standard Brine Thickness*: 2 to 3 in. thick. Designed for brine and ammonia gas lines, and for lines where the refrigerant temperature ranges from 0° F. to 25° F. *Ice Water Thickness*: approximately 1½ in. thick—for drinking water lines, cold water lines, etc., where temperature of 25° F. and higher is carried. *Special Heavy Brine Thickness*: 3 to 4 in. thick—for lines where the temperature runs below 0° F.

Note: Covering of the proper thickness must be used to secure satisfactory results.

Crescent Cork Covering

United Cork Lagging for Cylindrical Tanks—United Cork Lagging and Discs beveled to any desired radius without finish, coated one side, or coated both sides with mineral rubber finish, are furnished for covering cylindrical brine tanks, ammonia accumulators, ice water tanks, filters, etc.

Send for our literature giving detailed information, list prices, etc., and for samples if desired.

CRESCENT CORK BRICK FLOORS, CORK TILE AND BULLETIN BOARDS

Crescent Cork Bricks—Consist of a mixture of finely ground cork and specially prepared asphalt binder. They make a floor which is warm and comfortable. They do not rot, chip or splinter, and will sustain exceptionally heavy loads. They resist wear indefinitely and are especially adaptable for floors of machine shops, industrial plants, factories, etc.—in fact, wherever heavy duty floors are required. They are never slippery when wet or dry. Size, 1¾x4x9 in. Laid flat, four will cover

a square foot. Weight, approximately 2½ lb. each.

Crescent Cork Tile—Manufactured in three shades of brown and in many sizes. It is either ¼ or ½ in. thick as may be desired, and it is a quiet, dignified yet attractive, and wearproof floor.

Crescent Cork Bulletin Boards—¼ in. thick unmounted; ½ in. thick mounted, and in various sizes up to 4x6 ft.

CRESCENT MACHINERY ISOLATION CORKBOARD

Every moving piece of machinery sets up vibrations. In the average manufacturing plant it is also the principal source of noise. Vibrations and noise have proved to be a direct cause of fatigue, accidents, and carelessness. They diminish the efficiency and output of employees. Vibrations and noise should be eliminated whenever possible.

Pumps, fans, compressors, generators, motors, steam hammers, lathes, presses, etc., produce vibration noises that are transmitted to and frequently amplified by the foundations or floors upon which machines stand. They should be isolated from foundation or floor with

a material capable of absorbing their vibrations.

Crescent Machinery Isolation Corkboard, because of its natural elasticity and vibration absorption qualities, is the logical material for this purpose. Similar to United Corkboard (100% Pure Cork) but more densely compressed, it consists of thousands of granules of cork. Each granule is a mass of small, sealed cells containing trapped air. Hence these sheets of isolation corkboard form a large air cushion that absorbs and

breaks up the vibrations of the machines placed upon it. The structure of this material is very strong and will support exceptionally heavy loads with negligible compression. It is moisture-proof, easily installed and reasonable in price.

SPECIFICATIONS

The following detailed specifications show practically every type of construction that may be employed in insulating old as well as new cold storage buildings. We recommend that they be used as given, changing the thickness of corkboard to suit the temperatures that are to be maintained.

There will occur, of course, special constructions to meet particular purposes, unusual atmospheric conditions, temperatures, etc. For such cases separate and individual consideration is required. We cannot too strongly advise consulting our experienced engineers before going ahead with any kind of insulation work.

Specification No. 1

Walls—Masonry

One Course of Corkboard—

APPLIED WITH CEMENT TO BRICK, CONCRETE OR STONE—Two, three or four-inch United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The walls shall be insulated with a single course of . . . in. United Corkboard applied with a ½-in. bed of Portland cement mortar mixed one part cement and two parts clean, sharp sand. Corkboards shall be butted up close, making tight fitting joints, and all vertical joints shall be broken. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

Specification No. 2

Walls—Masonry

Two Courses of Corkboard—

FIRST COURSE APPLIED WITH CEMENT; SECOND COURSE APPLIED WITH CEMENT TO BRICK, CONCRETE OR STONE—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The walls shall be insulated with . . . in. of United Corkboard in two courses. The first course shall be . . . in. thick applied with a ½-in. bed of Portland cement mortar, mixed one part cement and two parts clean, sharp sand. The second course shall be . . . in. thick applied against the first course in a ½-in. bed of Portland cement mortar and additionally secured with wood skewers or special galvanized wire nails of proper length. All corkboards shall be butted up

close, making tight fitting joints. All vertical joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

Specification No. 3

Walls—Masonry

One Course Corkboard—AP-

PLIED WITH ASPHALT CEMENT TO BRICK OR CONCRETE—Two, three or four-inch United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The walls shall be insulated with a single course of . . . in. United Corkboard applied with hot asphalt cement. Before applying the cork-

board, the walls shall be Par-Locked according to Specification No. 33. All corkboards shall be butted up close, making tight fitting joints, and all vertical joints shall be broken. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

Specification No. 4

Walls—Masonry

Two Courses of Corkboard—

APPLIED WITH ASPHALT CEMENT TO BRICK OR CONCRETE—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The walls shall be insulated with . . . in. of United Corkboard in two courses. Before applying the corkboard, the walls shall be Par-Locked according to specification No. 33. The first course of corkboard shall be . . . in. thick applied with hot asphalt cement. The second course of corkboard shall be . . . in. thick applied against the first course with hot asphalt cement and additionally secured with wood skewers or special galvanized wire nails of proper length. All corkboards shall be butted up close, making tight fitting joints. All vertical joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

Specification No. 5

Walls—Masonry

Two Courses of Corkboard—FIRST COURSE APPLIED WITH CEMENT AND SECOND COURSE WITH ASPHALT CEMENT TO BRICK, CONCRETE OR STONE—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The walls shall be insulated with . . . in. of United Corkboard in two courses. The first course shall be . . . in. thick applied with a ½-in. bed of Portland cement mortar, mixed one part cement and two parts clean, sharp sand. The second course shall be . . . in. thick applied against the first course with hot asphalt cement and additionally secured with wood skewers or special galvanized wire nails of proper length. All corkboards shall be butted up close, making tight fitting joints. All vertical joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

**Specification No. 6****Walls—Frame**

One Course of Corkboard—NAILED TO WOOD FRAME WALLS—Two, three or four-inch United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The walls shall be insulated with two layers of waterproof insulation paper lapped not less than 3 in., followed by a single course of in. United Corkboard securely fastened with special galvanized wire nails of proper length. Corkboards shall be butted up close, making tight fitting joints and all vertical joints shall be broken. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

Specification No. 7**Walls—Frame**

Two Courses of Corkboard—APPLIED BY NAILING AND ASPHALT CEMENT TO WOOD FRAME WALLS—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The walls shall be insulated with two layers of waterproof paper and in. of United Corkboard in two courses. Two layers of waterproof paper lapped not less than 3 in. shall be applied against walls, followed by the first course of corkboard in. thick, securely fastened with special galvanized wire nails of proper length. The second course of corkboard in. thick shall be applied against the first course in a bed of hot asphalt, and additionally secured with wood skewers or special galvanized wire nails of proper length. All corkboards shall be butted up close, making tight fitting joints. All vertical joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

**Specification No. 8****Partitions—Cork**

One Course of Corkboard—SELF-SUPPORTED—Two, three or four-inch United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The partitions shall be solid cork and cement, constructed of a single course of in. United Corkboard erected on edge against temporary studs, securely toe-nailing each corkboard to adjacent corkboards with wood skewers or special galvanized wire nails of proper length. All corkboards shall be butted up close, making tight fitting joints and all vertical joints shall be broken. The exposed cork surface on each side shall be finished as described in Specification No. 34 or Specification No. 35.

Note: This class of construction is advantageous where no loads are to be carried and may safely be used with satisfactory results up to 9 ft. high for 2-in. corkboard, up to 12 ft. high for 3-in. corkboard and up to 15 ft. high for 4-in. corkboard.

Specification No. 9**Partitions—Cork**

Two Courses of Corkboard—SELF-SUPPORTED, CEMENT CORE—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The partitions shall be solid cork and cement constructed of in. of United Corkboard in two courses with a Portland cement core between. The first course shall be in. thick erected on edge against temporary studs, securely toe-nailing each corkboard to adjacent corkboards with wood skewers or special galvanized wire nails of proper length. The second course shall be in. thick erected against the first course with a ½-in. bed of Portland cement mortar, mixed one part cement and two parts clean, sharp sand and additionally secured with wood skewers or special galvanized wire nails of proper length. All corkboards shall be butted up close, making tight fitting joints. All vertical joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The exposed cork surface on each side shall be finished as described in Specification No. 34 or Specification No. 35.

Note: This class of construction is advantageous where no loads are to be carried and may be used safely up to 25 ft. in height.

**Specification No. 10****Partitions—Cork**

Two Courses of Corkboard—STEEL SUPPORTED, FOR CARRYING CEILINGS—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The partition shall be cork and cement, constructed of in. of United Corkboard in two courses reinforced by steel Tees. The first course shall be in. thick erected between 1½x1½x¼-in. steel Tees placed 36 in. apart well secured to floor and ceiling. The second course shall be in. thick applied against the first course with a ½-in. bed of Portland cement mortar, mixed one part cement and two parts clean, sharp sand and additionally secured with wood skewers or galvanized wire nails of proper length. All corkboards shall be butted up close, making tight fitting joints. All joints in the second course shall be broken in both directions with the joints in the first course. The exposed cork surface on each side shall be finished as described in Specification No. 34 or Specification No. 35.

**Specification No. 11****Floors—Concrete or Wood**

One Course of Corkboard—LAID ON CONCRETE OR WOOD BASE—CONCRETE AND CEMENT FINISH—Two, three or four-inch United Corkboard (100% Pure Cork) may be put down according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The floor shall be insulated with a single course of in. United Corkboard laid in a heavy mop coat of hot asphalt on a reasonably smooth and level concrete base. (Concrete base to be furnished by Owner). All corkboards shall be butted up close, making tight fitting joints and all transverse joints shall be broken. The top surface of cork shall be mopped with a coat of hot asphalt not less than ¼ in. thick, thoroughly sealing all joints. The insulation shall be finished with a

concrete and cement wearing floor 4 in. thick, consisting of 3-in. concrete and 1-in. Portland cement topping.

Note: This class of construction as specified may be used on wood floors, first covering the wood floor with one layer of waterproof paper lapped not less than 3 in. at each joint.

Specification No. 12

Floors—Concrete or Wood

Two Courses of Corkboard—Laid on Concrete or Wood Base, Concrete and Cement Finish—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be put down according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The floor shall be insulated with in. of United Corkboard in two courses laid on a reasonably smooth and even concrete base. (Concrete base to be furnished by Owner). The first course shall be in. thick laid in a heavy mop coat of hot asphalt. The second course shall be in. thick laid on the first course in a heavy mop coat of hot asphalt. All corkboards shall be butted up close, making tight fitting joints. All transverse joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The top surface of cork shall be mopped with a coat of hot asphalt not less than 1/8 in. thick, thoroughly sealing all joints. The insulation shall be finished with a concrete and cement wearing floor 4 in.

thick, consisting of 3 in. of concrete and 1 in. of Portland cement topping.

Note: This class of construction as specified may be used on wood floors, first covering the wood floor with one layer of waterproof paper lapped not less than 3 in. at each joint.

Specification No. 13

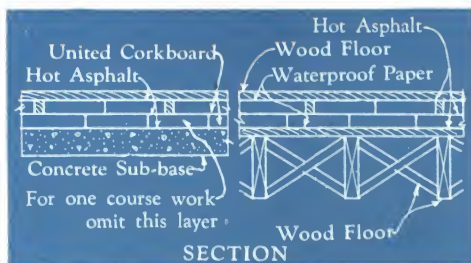

Floors—Concrete

One or Two Courses of Corkboard—Laid on Concrete or Wood Base—Wood Finish—Two, three or four-inch United Corkboard (100% Pure Cork) may be put down according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

One-course Work on Concrete—The floor shall be insulated with a single course of in. United Corkboard laid in a heavy mop coat of hot asphalt on a reasonably smooth and level concrete base. (Concrete base to be furnished by Owner.) Corkboards shall be laid between 2x.... in. wood sleepers placed 24 in. apart. All corkboards and sleepers shall be butted up close, making tight fitting joints and all transverse joints shall be broken. The top surface shall be mopped with a coat of hot asphalt not less than 1/8 in. thick, thoroughly sealing all joints. One layer of waterproof insulation paper lapped not less than 3 in. shall be laid on the cork followed by a wooden wearing floor of securely nailed to the sleepers.

Two-course Work on Concrete—When two courses of corkboard are required, the construction shall be similar to the

course in hot asphalt with wood sleepers as specified above. All joints shall be broken. A wood wearing floor of shall be securely nailed to the sleepers.

Note: Wood Construction—Either of these above types of construction as specified may be used on wood floors, first covering the wood floor with one layer of waterproof paper lapped not less than 3 in. at each joint.

Specification No. 14

Ceilings—Masonry

One Course of Corkboard—Applied with Cement to Concrete, Brick or Hollow Tile Ceilings—Two, three or four-inch United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The ceiling shall be insulated with a single course of in. United Corkboard applied with a 1/2-in. bed of portland cement mortar, mixed one part cement and two parts clean, sharp sand. All corkboards shall be butted up close, making tight fitting joints, and all transverse joints shall be broken. Each corkboard shall be shored up with a suitable support firmly holding it against ceiling to insure proper adhesion. The shoring shall be left in place for at least 12 hours, but shall not be removed until the cement mortar is well set. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

Specification No. 15

Ceilings—Masonry

Two Courses of Corkboard—Applied with Cement and Asphalt to Concrete, Brick or Hollow Tile Ceilings—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be applied according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The ceiling shall be insulated with in. of United Corkboard in two courses. The first course shall be in. thick applied with a 1/2-in. bed of Portland cement mortar, mixed one part cement and two parts clean, sharp sand. The second course shall be in. thick applied against the first course in hot asphalt and additionally secured with wood skewers or special galvanized wire nails of proper length. Each corkboard of the first course shall be shored up with a suitable support firmly holding it against the ceiling to insure proper adhesion. The shoring shall be left in place for at least 12 hours, but shall not be removed until the cement mortar is well set. All corkboards shall be butted up close, making tight fitting joints. All transverse joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The exposed cork surface shall be finished as described in Specification No. 34 or

Specification No. 35.

Note: This class of construction may also be used, applying the second course of corkboard with a 1/2-in. bed of Portland cement mortar instead of hot asphalt.

Specification No. 16

Ceilings—Concrete

One or Two Courses of Corkboard—Laid in Ceiling Forms Before Concrete Is Poured—Two, three or four-inch United Corkboard (100% Pure Cork) may be laid according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

One-course Work—The ceiling shall be insulated with a single course of in. pure corkboard laid dry in ceiling forms. Forms shall be erected by concrete contractor and left in. lower for slabs, and in. lower and in. wider for beams than would otherwise be required. Special

galvanized wire nails $1\frac{1}{2}$ in. longer than the thickness of the corkboard shall be driven obliquely into the upper side of the corkboards, using not less than two nails to each square foot, leaving the heads protruding approximately $1\frac{1}{2}$ in. All corkboards shall be butted up close, making tight fitting joints, and all transverse joints shall be broken. Concrete contractor shall then pour the concrete slab directly upon the corkboard. After the forms are removed (by the concrete contractor), the exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

Two-course Work—When two courses of corkboard are required, the construction shall be similar to the above except that a second course (of the required thickness) shall be laid

directly on the first course in $\frac{1}{2}$ in. of Portland cement mortar or hot asphalt. This course shall be additionally secured to the bottom course with not less than two wood skewers or galvanized wire nails to each square foot, driven through the top course to within at least $\frac{1}{2}$ in. of the underside of the bottom course. The special galvanized wire nails for anchoring the corkboard into the concrete shall be driven into the upper course as specified above.

Specification No. 17

Ceilings—Concrete

Two Courses of Corkboard—FIRST COURSE LAID IN CEILING FORMS BEFORE CONCRETE IS POURED AND SECOND COURSE APPLIED WITH HOT ASPHALT OR CEMENT AFTER FORMS ARE REMOVED—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be laid according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The ceiling shall be insulated with in. of United Corkboard, the first course in. thick laid dry in the ceiling forms. Forms shall be erected by concrete contractor and left in. lower for slabs; in. lower and in. wider for beams than would otherwise be required. Special galvanized wire nails $1\frac{1}{2}$ in. longer than the thickness of the corkboard shall be driven obliquely into the corkboards, using not less than two nails to each square foot, leaving the head protruding approximately $1\frac{1}{2}$ in. Concrete contractor shall then pour the concrete slab directly upon the corkboard. After the forms are removed (by the concrete contractor) the second course of in. thick United Corkboard shall be erected against the first layer with a $\frac{1}{2}$ -in. bed of Portland cement mortar mixed one part cement and two parts clean, sharp sand. The two courses shall be securely nailed to each other with wood skewers or special galvanized wire nails of proper length, using not less than two nails per square foot. All corkboards shall be butted up closely, making tight fitting joints. All transverse joints in the first course shall be broken. All joints in the second course shall be broken in both directions with the joints in the first course. The exposed cork surface shall be finished as described in Specification

Specification No. 18

Ceilings—Wood Frame

One Course of Corkboard—NAILED TO WOOD FRAME CEILING—Two, three or four-inch United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The sheathed ceiling shall be insulated with two layers of waterproof insulation paper lapped not less than 3 in., followed by a single course of in. United Corkboard securely fastened with special galvanized wire nails of proper length driven through No. 22 galvanized iron discs $1\frac{1}{4}$ -in. diameter. All corkboards shall be butted up close, making tight fitting

joints and all transverse joints shall be broken. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

Specification No. 19

Ceilings—Wood Frame

Two Courses of Corkboard—APPLIED BY NAILING AND ASPHALT CEMENT TO WOOD FRAME CEILING—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The sheathed ceiling shall be insulated with two layers of waterproof insulation paper and in. of United Corkboard in two courses. The two layers of paper lapped not less than 3 in. shall be applied against sheathing, followed by the first course of corkboard in. thick, securely fastened with not less than 2 galvanized wire nails of proper length to each square foot, driven through No. 22 galvanized iron discs $1\frac{1}{4}$ -in. diameter. The second course of corkboard in. thick shall be applied against the first course with hot asphalt cement and additionally secured with not less than 2 wood skewers or special galvanized wire nails of proper length to each square

foot. All corkboards shall be butted up close, making tight fitting joints. All transverse joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The exposed cork surface shall be finished as described in Specification No. 34 or Specification No. 35.

Note: This class of construction may also be used, applying second course of corkboard in Portland cement mortar instead of asphalt.

Specification No. 20

Ceilings—Wood Frame

Granulated Cork and One Course of Corkboard—APPLIED TO WOOD FRAME CEILINGS—Two, three or four-inch United Corkboard (100% Pure Cork) and granulated cork filling may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The ceiling shall be insulated with granulated cork filling and one course of in. United Corkboard. The underside of ceiling beams shall be sheathed with one course of $\frac{3}{4}$ -in. tongued and grooved boards and the spaces between beams shall be filled with granulated cork well packed in place. Two layers of waterproof insulation paper lapped not less than 3 in. shall be applied to sheathing followed by a single course of in. corkboard securely fastened with not less than 2 special galvanized wire nails of proper length to each square foot driven through No. 22 galvanized iron discs $1\frac{1}{4}$ in. in diameter. All corkboards shall be butted up close, making tight fitting joints

Specification No. 21

Roofs—Concrete

One Course of Corkboard—LAID ON CONCRETE ROOF SLAB—Two, three or four-inch United Corkboard (100% Pure Cork) may be put down according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The roof slab shall be prepared by giving the concrete surface a coat of special asphalt (or pitch) primer, evenly brushed on.

The concrete roof slab shall be insulated with one course of United Corkboard in. thick laid in a heavy coating of hot asphalt (or pitch); all joints to be sealed with the hot asphalt (or pitch) by pushing the corkboard a few inches into place. All corkboards shall be butted up close, making tight

fitting joints, and all transverse joints shall be broken.

On surfaces that are horizontal or nearly so, the slab shall be coated heavily

with hot asphalt and the boards pushed into place. On surfaces that are inclined or vertical, the corkboards shall be dipped in, or mopped with hot asphalt, to coat one side and two edges; then placed in position and nailed or held securely until the asphalt has cooled.

Note: Experience has demonstrated that hot asphalt (or pitch) mopped or poured, will not bond thoroughly to concrete surfaces, whereas the application of a primer will give the proper adhesion.

Specification No. 22

Roofs—Concrete

Two or Three Courses of Corkboard—LAID ON CONCRETE ROOF SLAB—Two, three or four-inch United Corkboard (100% Pure Cork) may be put down according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The roof slab shall be prepared by giving the concrete surface a coat of special asphalt (or pitch) primer, evenly brushed on.

The concrete roof slab shall be insulated with two courses of United Corkboard. The first course shall be in. thick laid in a heavy mopped coat of hot asphalt. The second course shall be in. thick laid on the first course in a heavy mopped coat of hot asphalt. (For three-course work, the third course shall be laid exactly like the second course). All corkboards shall be butted up close, making tight fitting joints. All transverse joints in the first course shall be broken and all joints in the second (or third) course shall be broken in both directions with the joints in the first (or second) course. The top surface of cork shall be left bare, and the roofing contractor, closely following the installation of the corkboard, shall lay the roofing in hot pitch or asphalt, directly upon the top of the corkboard.

Note: Experience has demonstrated that hot asphalt (or pitch) mopped or poured, will not bond thoroughly to concrete surfaces, whereas the application of a primer will give the proper adhesion.

Specification No. 23

Roofs—Wood Frame

One Course of Corkboard—LAID ON WOOD SHEATHED ROOF—Two, three or four-inch United Corkboard (100% Pure Cork) may be put down according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The wood roof deck shall be insulated with two layers of waterproof insulating paper weighing not less than nine (9) pounds per hundred square feet laid with hot asphalt between the two layers; all pa-

per shall be lapped not less than 3 in. and tacked down. One course of United Corkboard in. thick shall be securely nailed in position directly on top of the paper with two galvanized wire nails to each sheet of corkboard. All corkboards shall be butted up close, making tight fitting joints and all transverse joints shall be broken. The top surface of the cork shall be left bare, and the roofing contractor, closely following the installation of the corkboard, shall lay the roofing in hot pitch or asphalt directly upon the top of the corkboard.

Specification No. 24

Roofs—Wood Frame

Two or Three Courses of Corkboard—LAID ON WOOD SHEATHED ROOFS—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be put down according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The wood roof deck shall be insulated with two layers of waterproof insulating paper weighing not less than nine (9) pounds per hundred square feet, laid with hot asphalt between the two layers; all paper shall be lapped not less than 3 in. and tacked down. Two courses of United

Corkboard shall be laid directly upon the paper. The first course shall be in. thick laid dry. The second course shall be in. thick laid on the first course in a heavy mopped coat of hot asphalt. (For three-course work the third course shall be laid exactly like the second course). All corkboards shall be butted up close, making tight fitting joints. All transverse joints in the first course shall be broken and all joints in the second (or third) course shall be broken in both directions with the joints in the first (or second) course. The top surface of cork shall be left bare, and the roofing contractor, closely following the installation of the corkboard, shall lay the roofing in hot pitch or asphalt directly upon the top of the corkboard.

Specification No. 25

Concrete Construction Floor and Ceiling Bands (Ribbons)

Two Courses of Corkboard—APPLIED TO ENDS OF BEAMS, GIRDERS, FLOOR AND ROOF SLABS EXTENDING INTO WALLS—Two, three or four-inch United Corkboard (100% Pure Cork) may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

All beams and girders extending into the building walls shall be insulated on the sides and bottoms in from ends for a distance of 4 ft. 0 in. for coolers and 6 ft. 0 in. for freezers. All intermediate floor slabs shall be insulated on the bottom with a band (ribbon) extending 4 ft. 0 in. for coolers and 6 ft. 0 in. for freezers, in from insulated walls. All floor slabs and the roof slab shall be insulated on the top, from wall to wall, over the entire area. The insulation shall consist of two courses of in. thick United Corkboard. The application of the band (ribbon) to the bottom of the slabs, and to beams, shall be made as described in Specification No. 15. The application of the in-

sulation to the top of the floor and roof slabs shall be made as described in Specifications No. 12 and No. 22 respectively. All band (ribbon) insulation shall be thoroughly tied in with the wall insulation, breaking all joints.

Specification No. 26

Freezing Tanks

Two Courses of Corkboard Under Bottom and Granulated Cork on Sides—ON WOOD FLOOR OR CONCRETE FOUNDATION—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) and any thickness of granulated cork may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

Bottom—The bottom of the tank shall be insulated with in. of United Corkboard in two courses laid on a reasonably smooth and even foundation. (Foundation to be furnished by Owner.)

The first course shall be in. thick laid in a heavy mop coat of hot asphalt. The second course shall be in. thick laid on the first course in a heavy mop coat of hot asphalt. All corkboards shall be butted up close, making tight fitting joints. All transverse joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The top surface of cork shall be mopped with a coat of hot asphalt not less than 1/8 in. thick, thoroughly sealing all joints, ready for the tank to be placed on top. This insulation shall be extended to

the outside of the insulation on the sides of the tank.

Sides—The sides of the tank adjacent to building walls shall be insulated by filling in the in. space between the tank and the walls with granulated cork well packed in place. The building walls shall be waterproofed with a heavy coat of hot asphalt to the full height of the tank, leaving no unprotected places. The top of granulated cork all around the tank shall be covered with a single course of in. thick United Corkboard carefully fitted between the tank and the building walls and the top surface coated with hot asphalt, thoroughly sealing all joints. The top of the insulation all around the tank shall be protected by a curbing consisting of two courses of 7/8-in. tongued and grooved boards with two courses of waterproof insulation paper between, laid on properly supported framing so that the top surface of curbing is flush with the ice can covers. The curbing shall extend from the outside of insulation to the ice can covers.

Specification No. 27

Freezing Tanks

Two Courses of Corkboard Under Bottom and Granulated Cork on Sides, Wood Finish—ON WOOD FLOOR OR CONCRETE FOUNDATION—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) and any thickness of granulated cork may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

Bottom—The bottom of the tank shall be insulated with in. of United Corkboard in two courses laid on a reasonably smooth and even foundation. (Foundation to be furnished by Owner.) The first course shall be in. thick laid in a heavy mop coat of hot asphalt. The second course shall be in. thick laid on the first course in a heavy mop coat of hot asphalt. All corkboards shall be butted up close, making tight fitting joints. All transverse joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The top surface of cork shall be mopped with hot asphalt not less than 1/8 in. thick, thoroughly sealing all joints, ready for the tank to be placed on top. This insulation shall be extended to the outside of the insulation on the sides of the tank.

Sides—The sides of the tank shall be insulated with

in. of granulated cork well packed in between tank and retaining walls constructed of 2x6-in. studs at 16-in. centers placed in. away from the sides of the tank. The studding shall be sheathed on outside with two courses of 7/8-in. tongued and grooved boards with two layers of waterproof insulation paper between, lapping the paper not less than 3 in. The first course of tongued and grooved boards shall be erected horizontally and the second course vertically. The studs shall be nailed to a 2x6-in. plate at the bottom and shall be substantially secured to the top of the tank with suitable framing. The top of insulation all around the tank shall be protected by a curbing consisting of two courses of 7/8-in. tongued and grooved boards with two layers of waterproof insulation paper between laid on properly supported framing so that the top surface of curbing is flush with the ice can covers. The curbing shall extend from the outside of the installation to the ice can covers.

Specification No. 28

Freezing Tanks

Two Courses of Corkboard Under Bottom and One Course of Corkboard and Granulated Cork on Sides, Cement Plaster or United Sealtite Mastic Finish—ON WOOD FLOOR OR CONCRETE FOUNDATION—Two, three, or four-inch United Corkboard (100% Pure Cork) and 4 or 6 in. of granulated cork may be erected according to the following specifications: (See catalogue page 5 for recommendations of thicknesses).

Bottom—The bottom of the tank shall be insulated with in. of United Corkboard in two courses, laid on a reasonably smooth and even foundation. (Foundation to be furnished by Owner.) The first course shall be in. thick laid in a heavy mop coat of hot asphalt. The second course shall be in. thick laid on the first course in a heavy mop coat of hot asphalt. All cork boards shall be butted up close, making tight fitting joints. All transverse joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The top surface of cork shall be mopped with a coat of hot asphalt not less than 1/8 in. thick, thoroughly sealing all joints ready for the tank to be placed on top. This insulation shall be extended to the outside of the insulation on the sides of the tank.

Sides—The sides of the tank shall be insulated with in. of granulated cork and one course of in. pure corkboard. 3x4-in. (or 3x6-in.) studs shall be erected against the sides of the tank at 18-in. centers well secured to the top of the tank and to a 2x4-in. wood plate at bottom. The corkboard

shall be erected against the studs securely fastened with special galvanized wire nails of proper length. The space between the corkboard and the tank shall be filled with granulated cork well packed in place. All corkboards shall be butted up close making tight fitting joints and all vertical joints shall be staggered. The exposed cork surface shall be finished as described in Specification No. 34 or No. 35. The top of the insulation all around the tank shall be protected by a curbing consisting of two courses of 7/8-in. tongued and grooved boards, with two layers of waterproof insulation paper between, laid on properly supported framing so that the top surface of curbing is flush with the ice can covers. The curbing shall extend from the outside of the insulation to the ice can covers.

Note: Wood finish according to Specification No. 29 may be substituted for the cement or mastic finish.

Specification No. 29**Freezing Tanks**

Two Courses of Corkboard Under Bottom and Two Courses of Corkboard on Sides, Wood Finish, Portland Cement or Mastic Finish—ON WOOD FLOOR OR CONCRETE FOUNDATION—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) under bottom and on sides may be erected according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

Bottom—The bottom of the tank shall be insulated with in. of United Corkboard in two courses laid on a reasonably smooth and even foundation. (Foundation to be furnished by Owner). The first course shall be in. thick laid in a heavy mop coat of hot asphalt. The second course shall be in. thick laid on the first course in a heavy mop coat of hot asphalt. All corkboards shall be butted up close, making tight fitting joints. All transverse joints in the first course shall be broken and all joints in the second course shall be broken in both directions with the joints in the first course. The top surface of cork shall be mopped with a coat of hot asphalt not less than $\frac{1}{8}$ in. thick, thoroughly sealing all joints, ready for the tank to be placed on top. This insulation shall be extended to the outside of the insulation on the sides of tank.

Sides—The sides of the tank shall be insulated with in. of United Corkboard in two courses. Studs (2x3 in., 3x3 in., 3x4 in.) shall be erected against the tank 36 in. apart, well secured to the top of the tank and to a wood plate at the bottom. The first course shall be in. thick set between studs and applied against tank with hot asphalt and toe-nailed to studs. The second course shall be in. thick applied against the first course with hot asphalt and nailed to studding. All corkboards shall be butted up close, making tight fitting joints. All joints in the second course shall be broken in both directions with the joints of the first course and all vertical joints shall lap the studs by at least 6 in. The insulation shall be finished with two courses of $\frac{7}{8}$ -in. tongued and grooved lumber erected vertically with two layers of waterproof paper between, lapping the paper not less than 3 in. The wood finish shall be securely nailed to suitable wood furring strips placed along the top and bottom of the tank.

Note: Cement or mastic finish according to Specification No. 34 or No. 35 may be substituted for the wood finish.

Specification No. 30**Cylindrical Tanks, Coolers, Filters, etc., with Flat or Curved Tops**

One Course of Corkboard, Asphalt Finish—Two, three or four-inch United Corkboard (100% Pure Cork) Lagging may be applied according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The shall be insulated with one course of in. United Corkboard Lagging beveled to the proper radius to fit the cylindrical surface. The inside and outside surfaces of lags shall be asphalt coated. The lags shall be applied to the shell of the and to each other with asphalt paint and securely fastened with wire

every 6 in. The entire insulated surface shall be finished with a heavy coat of asphalt paint applied evenly, or given a mastic finish according to Specification No. 35.

The bottom of the shall be insulated with a disc of in. United Corkboard laid in hot asphalt. The top surface shall be flooded with a coat of hot asphalt.

For Flat Top—The top of the shall be insulated with a removable cover constructed in two halves of one course in. corkboard coated on all sides with asphalt placed between two courses of $\frac{7}{8}$ -in. tongued and grooved lumber and two layers of waterproof paper.

For Curved Top—For tanks, coolers, etc., with heads as changing instruction for top insulation to read as follows: per drawing (Specification No. 31), use the above specifications

The head of the shall be insulated with a cork disc made of in. United Corkboard, lagging quality, asphalt coated both sides and cemented together with asphalt, breaking all transverse joints. The disc shall be cemented to the ends of cork lagging on the sides of the with asphalt paint and the space between the head and the disc shall be filled in with fine re-granulated cork. The entire insulated surface shall be finished with a heavy coat of asphalt paint applied evenly, or given a mastic finish according to Specification No. 35.

Specification No. 31**Cylindrical Coolers, Brine Tanks, etc.**

Two Courses of Corkboard—ASPHALT FINISH—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be applied according to the following specifications:

(See catalogue page 5 for recommendations of thicknesses).

The shall be insulated with two courses of in. United Corkboard Lagging beveled to the proper radius to fit the cylindrical surface. The inside and outside surfaces of lags shall be asphalt coated. The lags of the first course shall be applied to the shell of the and to each other with asphalt paint and securely wired in place. The lags of the second course shall be applied against the first course and to each other than asphalt paint and securely fastened with wire every 6 in. All joints in the second course shall be broken in both directions with the joints in the first course. The entire insulated surface shall be finished with a heavy coat of asphalt paint applied evenly, or given a mastic finish according to Specification No. 35.

The bottom of the shall be insulated with a cork disc in. thick made of two courses of in. United Corkboard, lagging quality, asphalt coated both sides and cemented together with asphalt. The joints of each course shall be broken in both directions with the joints of the other course. The disc shall be laid in hot asphalt and coated on all sides.

The head of the shall be insulated with a cork disc in. thick made of two courses of in. United Corkboard, lagging quality, asphalt coated both sides and cemented together with asphalt. The joints of each course shall be broken in both directions with the joints of the other course. The disc shall be cemented to the ends of cork lagging on the sides of the with asphalt paint and the space between head and disc shall be filled in with fine re-granulated cork. The entire insulated surface shall be finished with a heavy coat of asphalt paint applied evenly, or given a mastic finish according to Specification No. 35.

Specification No. 32**Cylindrical Brine Coolers**

Two Courses of Corkboard, Asphalt Finish—Four, five, six, seven or eight inches of United Corkboard (100% Pure Cork) may be applied according to the following specifications: (See catalogue page 5 for recommendations of thicknesses).

The body of the cooler shall be insulated between the flanges with two courses of . . . in. United Corkboard Lagging beveled to the proper radius to fit the cylindrical surface. The inside and outside surfaces of lags shall be asphalt coated. The lags of the first course, extending from flange to flange, shall be applied to the shell of the cooler and to each other with asphalt paint and securely wired in place. The lags of the second course, extending from top to bottom disc, shall be applied against the first course and to each other with asphalt paint and securely fastened with wire every 6 in. All joints in the second course shall be broken in both directions with the joints in the first course. The entire insulated surface shall be finished with a heavy coat of asphalt paint applied evenly, or given a mastic finish according to Specification No. 35.

The bottom of the cooler shall be insulated with a cork disc . . . in. thick made of two courses of . . . in. United Corkboard, lagging quality, asphalt coated both sides and cemented together with asphalt. The joints of each course shall be broken in both directions with the joints of the other course. The disc shall be laid in hot asphalt and coated on all sides. The space between the bottom of cooler and disc shall be filled in with fine re-granulated cork.

The head of the cooler shall be insulated with a cork disc . . . in. thick made of two courses of . . . in. United Corkboard, lagging quality, asphalt coated both sides and cemented together with asphalt. The joints of each course shall be cemented to the ends of cork lagging on the sides of the cooler with asphalt paint and the space between cooler head and disc shall be filled in with fine re-granulated cork. The entire insulated surface shall be finished with a heavy coat of asphalt paint applied evenly, or given a mastic finish according to Specification No. 35.

The flanges of the cooler shall be insulated with an additional course of . . . in. thick United Corkboard, lagging quality, applied in the same manner as specified for body lags. The top flange lags shall extend from the top disc to a point 6 in. below top flange of cooler.

The bottom flange lags shall extend from the bottom disc to a point 6 in. above bottom flange of cooler.

Specification No. 33**Par-Lock**

For Dampproofing and Airproofing Concrete, Brick or Tile Surfaces, Against Which United Corkboard (100% Pure Cork) Is to Be Erected—All surfaces to be Par-Locked shall be sufficiently cleaned to remove all dirt, oil, grease and other foreign matter. All large concrete and masonry clinkers and projections

necessary to be removed, and all interstices necessary to be filled up, shall be removed and filled before the application of Par-Lock. In case the surface to be Par-Locked is not perfectly uniform and level, such as would be the case with terra-cotta tile, uneven brick or masonry, etc., the inside surface of the walls shall be coated with one coat of Portland cement plaster mixed one part Portland cement, two parts clean, sharp sand, and proper amount of integral waterproofing, applied approximately $\frac{1}{2}$ in. thick, leaving a true, level and perpendicular surface.

All frozen surfaces shall be heated and the ice or frost thawed sufficiently to permit the driving of the bonding material into the voids. The surfaces must be dry when the Par-Lock is applied.

The Par-Lock bonding material furnished and installed by the UNITED CORK COMPANIES, Lyndhurst, N. J., shall be applied in the same consistency as received in the original package. If the bonding material thickens because of exposure to the air or during very cold weather, it may be thinned with naphtha sufficiently to permit an even flow for application.

The surfaces to be Par-Locked shall receive two thorough coats of bonding material evenly applied. Each course shall lap back one-half over the preceding course, and be applied sufficiently heavy for the first coat to cover approximately 200 sq. ft. and the second coat to cover approximately 125 sq. ft. per gal., and to afford an impervious film between the structural surface and the insulation. The first coat is to become hard dry before the second is applied. The Par-Lock should preferably be applied through a Par-Lock Asphalt gun under an air pressure of 50 lb. per sq. in. Where the job is not of sufficient size to warrant the use of a gun, Par-Lock bond may be applied with a brush by hand, taking particular care to thoroughly coat all surfaces.

United Corkboard shall then be erected against the Par-Lock bond in hot asphalt. (See Specifications Nos. 3 and 4.)

Specification No. 34**Portland Cement Plaster**

For Finish for United Corkboard (100% Pure Cork)—All exposed surfaces of the corkboard shall be finished with approximately $\frac{1}{2}$ in. Portland cement plaster applied in two coats, mixed one part Portland cement and two parts clean, sharp sand. The second coat shall be floated or troweled to a smooth and even finish and scored off in squares of not over 5 ft.

Note: Portland cement plaster is the best and most durable finish for corkboard insulation, but it will develop shrinkage cracks to some extent. The mixture of cement mortar as specified will give best results but cannot be guaranteed to be entirely free from cracking. Such cracks, however, do not impair the efficiency of the insulation, and if the surfaces are scored off in squares as specified the cracking will usually occur in the score marks and will not show.

Specification No. 35**United Sealtite Mastic Finish**

For Finish for United Corkboard (100% Pure Cork)—All exposed surfaces of the corkboard shall be finished with approximately $\frac{1}{8}$ in. United Sealtite Mastic applied in two coats and troweled to a smooth and even finish. Care shall be taken that all trowel marks are thoroughly worked out of the Mastic Finish.

The Mastic Finish shall be applied in accordance with the following specifications:

(1) A priming coat of United Sealtite Neat Emulsion shall be applied directly on to the face of the corkboard of only sufficient thickness to well cover the granules of cork and the interstices. This priming coat may be readily brushed on. If it is necessary to thin out the material, add only sufficient water to bring it to the proper consistency. If a troweled on priming coat is desired, United Sealtite Fibrated Emulsion shall be used instead of Neat Emulsion, as it trowels much more readily.

(2) The second and finish coat shall be troweled on approximately $\frac{1}{8}$ in. thick, after the primer is hard and dry. It shall be mixed in the proportion, two parts United Sealtite Fibrated Emulsion and one part clean, sharp sand. Care shall be taken to see that the sand is thoroughly screened and free from all loam and gravel. Sufficient water shall be added to the mix to make it work easily.

After the finish coat has been applied, it shall be allowed to partly dry out and then it shall be troweled down again, when the trowel marks can be very readily worked out.

No artificial means of promoting the drying of the Mastic shall be applied.

Specification No. 36

Ice Storage Houses

The method of insulating ice storage houses is of such importance that we believe it is necessary to adopt a standard recommendation for this particular type of construction. If the following specifications are strictly adhered to, failures of insulation in Ice Storages will appear very seldom, as has been proven by actual installations that have been in use for a number of years.

(1) Walls: All exterior exposed walls should be erected of a required thickness with back bricks of No. 1 Common Brick and a face course of bricks which are impervious to water. The outside of the wall should preferably be treated with colorless waterproofing. (Hollow terra-cotta tile, cement tile and cinder block walls should be avoided).

(2) The inside surface of the wall shall be coated with one coat of Portland cement plaster mixed one part Portland cement, two parts clean, sharp sand, with proper amount of integral waterproofing compound floated on approximately $\frac{1}{2}$ in. thick, leaving a true, level perpendicular surface.

(3) After this coat of Portland cement plaster has thoroughly dried out, two coats of Par-Lock Bond shall be applied through a pressure gun.

(4) Directly against this wall one layer of 2 in. thick United Corkboard shall be erected against the Par-Lock in hot asphalt, followed by an additional layer of 2 in. thick United Corkboard erected against the first layer of corkboard in hot asphalt; and additionally secured in position by means of six $4\frac{1}{2}$ -in. wooden skewers to each sheet of corkboard. All joints between the sheets of corkboard shall be broken both horizontally and vertically.

(5) The exposed surface of the corkboard shall be given a finish of United Sealite Mastic approximately $\frac{1}{8}$ in. thick, applied in two coats and troweled to a smooth even finish. Care shall be taken that all trowel marks be thoroughly worked out of the Mastic.

(6) In new ice storages, $\frac{5}{8}$ -in. round expansion or $\frac{5}{8}$ -in. round anchor bolts shall be built into the brick walls 5 ft. 0 in. apart and 5 ft. 0 in. vertical centers. In existing buildings which are to be converted into ice storages, $\frac{5}{8}$ -in. round expansion bolts shall be anchored into the brick walls on the same centers as specified above. After the insulation is erected, 4x6-in. wooden vertical buck stays shall then be erected on edge drawn up tight against the surface of the insulation by means of wing nuts on the anchor bolts. Each bolt head shall be counter-sunk in the wooden buck stay at least 1 in. so that a 2-in. thick plug of corkboard may be wedged in, insulating the bolt head. The plug shall be mopped with hot asphalt. These buck stays positively must be used on all walls over 15 ft. 0 in. high.

(7) United Sealite Mastic shall be used in all seasonal ice storages, and preferably in all daily ice storages, except that in daily ice storages up to 16 ft. 0 in. high Portland cement finish may be used.

(8) A 3x6-in. wood bumper strip shall be installed at the floor line of all walls to protect the mastic finish from knocks and jars caused by sliding cakes of ice.

(9) Ceilings—In every ice storage where a trussed roof type of construction is used, a ventilated air space or loft shall be provided over the ceiling of the ice storage. This air space shall be thoroughly ventilated by means of louvers located in the walls at the ends of the loft.

(10) The wall spaces between each of the roof rafters shall be left open and covered on the outside with $\frac{1}{4}$ -in. galvanized wire mesh, to provide air circulation in the eaves of the building. Roof ventilators shall be provided whenever possible.

(11) Insulation shall be placed on the top side of ice storage house ceilings in every instance. A slot shall

be left around the entire perimeter of the building in the ceiling construction and be tied in with the insulation which is laid directly on top of the ceiling.

(12) In ceilings of wood construction, two layers of heavy insulating paper shall be laid directly on top of the wood sheathed ceiling. The first layer shall be laid dry but spotted with hot asphalt, and the second layer shall be laid in mopped hot asphalt. Directly on top of the paper, two layers of 2 in. thick United Corkboard shall be laid in hot asphalt, and the top surface of the corkboard shall be flooded with hot asphalt. All joints between the sheets of corkboard shall be broken.

(13) Five inches of corkboard (one layer of 3 in. and one layer of 2 in.) should be used in every instance where possible, although we will place our guarantee on an installation where two layers of 2 in. are used, only however, for an ice storage where there is an air space or loft above the ceiling.

(14) For ceilings of concrete construction, two layers of paper may be laid directly on the concrete in hot asphalt. For this type construction, however, the paper may be eliminated and concrete slab primed with asphaltic concrete primer or emulsified asphalt. The two layers of United Corkboard shall then be laid directly on top of the concrete slab in hot asphalt, and the top surface of the corkboard shall be flooded with hot asphalt. This also applies to ice storages only where there is an air space above the ceiling.

(15) In all ice storages where the ceiling of the ice storage is the roof of the building and has no air space over it, the corkboard shall be laid directly upon the roof construction in exactly the same manner as specified above except that two layers of 3 in. thick United Corkboard is the minimum amount of insulation that must be placed upon roofs of such ice storages. Two layers of 4 in. thick United Corkboard is preferable, and is recommended for warm climates, although we will guarantee an installation with 6 in. thick corkboard on the roof. No asphalt should be applied to the top surface of the corkboard, unless asphalt roofing is used. When pitch and felt roofing is used the top surface of the corkboard shall be left bare, and the roofing applied directly on the corkboard.

(16) In this type of construction, the ends of all beams bearing in the exposed walls shall be insulated by insulating the pocket in the brick wall on all sides with two layers of 2 in. thick United Corkboard, and by insulating each beam on the sides and bottom 4 ft. 0 in. in from each end with one layer of 3 in. thick United Corkboard erected in hot asphalt.

(17) In all installations where the corkboard is to be laid upon a concrete slab, the concrete slab must be floated to a smooth and even surface with no voids or pockets which would tend to prevent the insulation from lying absolutely flat. It is recommended that concrete slabs be given one coat of asphalt primer before laying the corkboard.

(18) Floors—A 6-in. concrete sub-base should be provided for the floors of all ice storage houses, and the top surface of this concrete sub-base must be floated smooth and even. (Thickness of and reinforcing for floors must be designed to suit conditions in each individual ice storage). Directly on top of this base, two layers of 2-in. thick United Corkboard shall be laid in hot asphalt flooding the top surface of the corkboard with hot asphalt. A 4-in. concrete wearing floor must then be installed directly on top of the corkboard with the floor pitched to the center of the storage for drainage. 4x4-in. racks shall then be placed on the floor 12 in. apart with a wood slat floor laid upon them on which the ice will rest. These racks provide for circulation of air under the ice pile.

A bell trap drain shall be provided in the floor at the center of the storage.

(19) Doors—Standard make regular cold storage doors shall be installed with door bucks thoroughly insulated.

The Company

The CORK INSULATION COMPANY, INC., was organized in 1924 to provide a complete insulation service for architects, owners and builders. It manufactures its own cork products in modern factories at Wilmington, Delaware, and Algeciras, Spain. Staff engineers of the CORK INSULATION COMPANY, INC. are specialists in refrigeration and insulation, and are ready to assist architects without fee or obligation. Many noteworthy installations in the United States, Canada and Mexico stand to their credit. A typical example is the Pennsylvania Dock and Warehouse at Jersey City, New Jersey, where 3,500,000 ft. of Corinco Corkboard were installed. The engineering work and actual construction were entrusted entirely to CIC.

Advantages of Cork Insulation

Cork is composed of millions of tiny air cells and is therefore an excellent non-conductor of heat. As these

resinous cells repel moisture, cork is durable in service. It is odorless and sanitary; will not taint footstuffs or harbor vermin. It is compact and takes up little usable space; a feature of great importance where rooms are small and costs per cubic feet high. It is strong and easy to install. It is fire-retarding and slow burning, thus taking low insurance rates. Cork is moderately priced and effects great savings in refrigeration.

Corinco Corkboard

Firm, compact, long-lived, Corinco Corkboard is internationally known for its high insulating efficiency and great durability. It is made of granulated cork, compressed in moulds and baked until the natural gum melts

Unloading Baled Cork
Waste at Factory,
Wilmington, Del.

Cork Stripper Removing Bark from
the Cork Oak Tree in Spain

and binds the mass together. No artificial binder is used.

Corinco Corkboard is unexcelled for all cold insulation. Properly applied, it will not lose its efficiency even after years of use. It is handled like lumber, cut, sawed and nailed; and may be set in mortar or asphalt against masonry. Manufactured in sheets 12x36 in. and in the following thicknesses: 1, 1½, 2, 3 and 4 in.

Specification and Instruction Books—For the guidance of architects and builders, the CORK INSULATION COMPANY, INC. has prepared a manual of specification sheets covering the various methods of properly applying Corinco Corkboard. This manual may be obtained on request.

Corinco Cork Pipe Covering

Corinco Cork Pipe Covering, like Corinco Cork-board, is made of pure cork granules baked under compression to bring out the natural waterproof gum. It is made to fit all sizes of piping from $\frac{1}{4}$ in. up, and moulded jacket coverings are furnished for all types of fittings. Both the inside and outside surfaces of the covering are finished with a special airtight mastic ironed-on at the factory. With all cork covering sufficient Corinco Waterproof Cement for the joints, together with Corinco Seam Filler, copper clad steel wire and Corinco Cork Pipe Covering Paint, are furnished for the proper application of this material.

The use of regular fitting covers cannot be too strongly recommended. Materials that are built up on the job almost always leave air-pockets in which frost will form. Frost will break away the cover and attack the entire insulation. Corinco fittings covers are made to exact dimensions and fit as tightly as the straight pipe covering.

Thicknesses

Corinco Cork Pipe Covering is furnished in three thicknesses: *Special Thick Brine* (from 3 to 4 in. thick) for temperatures below 0° F.; *Brine* (from 2 to 3 in. thick) for temperatures 0° F. and 25° F.; *Ice Water* ($1\frac{1}{2}$ to 2 in. thick) for temperatures 25° F. to 45° F.

Corinco Cork Lag Covering

The insulation of cylindrical coolers, accumulators, and tanks for brine, ice water, etc., requires the use of Corinco Cork Lag Covering. This insulation is a special grade cork of extra density. It is built up on the surface to be insulated, as moulded covers for this purpose could not be manufactured practicably. For insulating the ends of tanks, discs of the required thickness of cork are made to order. Both these discs and the lagging are coated inside and out with a special airtight mastic ironed-on at the factory.

The many sizes and styles of this type of equipment make it necessary that we be furnished with a sketch

Right:

Corinco Cork Pipe Covering Installations

Drinking Water Lines

The refrigerated drinking water system is now recognized as an essential safeguard to health, as well as an economy in money and labor, in all public and semipublic buildings. When the lines are covered with Corinco Cork Pipe Covering, water will be delivered to all points at the most palatable temperature (45° to 50°) with a minimum of refrigeration. The use of cork pipe covering is essential where the lines are to be run behind walls or through chases, as inferior insulating materials will quickly become water soaked, damaging walls and ceilings in addition to losing efficiency.

giving accurate measurements, so that the covering may be supplied in the proper lengths, widths and bevel.

Catalog and Price List

The Corinco Cork Pipe Covering Catalog fully describes the entire line of Corinco Cork Pipe Covering, and also includes a detailed section of specifications for the proper application of Corinco Cork Pipe Covering and Lagging. The Corinco Cork Pipe Covering Price List supplies full information for determining and ordering the required units. These booklets will be forwarded on request.

Laying Corinco Corkboard on the Roof of a 300-ton Ice Plant for Rubel Corp., Brooklyn, N. Y.

Insulation was 8 in. thick and was built up in two layers of 3-in. corkboard and one layer of 2-in. corkboard

Engineering and Construction Service

While cork is generally recognized as one of the finest materials for use in its several fields of application, much depends upon the methods of installation that are employed. This is particularly true of cold storage, where, for example, such factors as the inside temperature, outside temperature, mean annual temperatures and atmospheric densities must be correlated to the rate of thermal transmission of the walls, the ductility of the asphalt, etc., before the proper thickness of corkboard can be determined, or the methods of installation specified. To assist architects in this work, the services of the staff of insulation engineers of the CORK INSULATION COMPANY, INC., are freely offered.

As the actual work of installation is also highly specialized, the CORK INSULATION COMPANY, INC., maintains trained crews of erection men to properly handle insulation work.

The services of these crews are usually no more expensive than the work of local mechanics, and are invariably more satisfactory.

For any installations CIC *complete service* is recommended.

Patented Panel System of Marine Insulation

The CORK INSULATION COMPANY, INC., has the exclusive American rights to the revolutionary new

Panel System of Marine Insulation. This system is applicable to all types of refrigerated space on ships, and makes possible great

savings in time, labor, initial cost, and upkeep. Its outstanding features are, the independent insulation of each frame and beam space; the portability of the insulation linings; the standardization of the panel linings and the wood grounds; and the total elimination of wood buried in the insulation. The panels are filled with a mixture of light, clean, granulated cork and silicate cotton. At bulkheads or decks in the way of the machinery space and at bunkers, special fireproof construction is possible with this system. Scupper and brine service pipes, etc., behind insulation may be very readily inspected by simply removing one panel—or part of a panel.

As the Panel System is standardized throughout, all grounds being identical, all holes being bored to template, etc., much time and labor can be saved in designing, drafting, and installing. The CORK INSULATION COMPANY, INC., is equipped to furnish complete panel installations at less than the cost of the ordinary systems now in use. The Panel System is fully protected by patents and the rights to its exclusive use in the United States have been assigned to the CORK INSULATION COMPANY, INC. A folder giving all details of the Panel System will be sent on request.

Products

ARMSTRONG'S CORKBOARD for the insulation of cold storage, freezing and constant temperature rooms and tanks.

ARMSTRONG'S CORK COVERING for brine, ammonia, refrigerated drinking water and all other low temperature pipe lines.

For Armstrong's Corkboard for house and roof insulation, cork machinery isolation, Corkoustic for sound-quieting and acoustical treatment, Temlok for house and roof insulation, see Manufacturers' Index.

Armstrong's Corkboard

Armstrong's Corkboard is generally recognized as the standard insulation for cold storage and constant temperature rooms of all kinds.

Advantages—Containing no foreign substances and consisting only of pure cork, the heat conductivity of Armstrong's Corkboard is low. It will not absorb moisture. It is easy to install, and when erected properly, Armstrong's Corkboard is proof against mold, rot and vermin, and will not absorb or give off offensive odors or deteriorate in any way. Furthermore, Armstrong's Corkboard is slow burning and does not smolder or carry fire. It has been tested and approved by the National Board of Fire Underwriters.

Erecting Armstrong's Corkboard Against Concrete Walls in Portland Cement Mortar

Armstrong's Corkboard is giving excellent satisfaction in thousands of plants employing refrigeration, situated throughout the civilized world.

Cold Storage Room Insulated with 6 Inches of Armstrong's Corkboard, Fisherman's Cooperative Sales & Cold Storage Co., Detroit, Mich.

Specifications—An efficient barrier to heat flow to refrigerator areas necessitates the following:

(1) Insulation which is structurally strong, a non-supporter of combustion, moisture resisting, easy to apply, and low in conductivity.

(2) Application with the right kind of sundry material including the proper preparation of the wall and selection of the right kind of material for finishing the insulation.

(3) Application by experienced craftsmen.

Generally speaking, a dense wall structure such as monolithic concrete is preferred. A porous material such as hollow tile should be avoided. The walls should be sprayed with two coats of Armstrong's No. 3 Asphaltic Paint according to our standard specifications. Armstrong's Corkboard in the proper thickness should then be erected in Armstrong's special erection asphalt, specially selected because of its ductility and holding qualities at low temperatures.

Ordinarily, Armstrong's Corkboard on walls and ceilings can be finished with portland cement plaster applied directly to the exposed cork surface. However, for ceilings or for other conditions where considerable mois-

Applying Armstrong's Cork Covering and Lagging at the Plant of J. Butler & Co., Long Island City, N. Y.

ture is prevalent, Armstrong's Mastic Finish should be used.

For a finish not quite as impervious as mastic finish, but which will give a smoother surface, specify Armstrong's Asphalt Emulsion, a plastic finish applied on the job in two coats, each one 1 in. thick.

Partition Walls—Partition walls can be erected of Armstrong's Corkboard without the necessity of a concrete, brick or tile supporting surface. If such a wall is built of an asphalt core it should have at least one surface plaster finish to give the wall rigidity. Some architects and engineers specify tee irons embodied in such walls to obtain the same result.

Thickness of Insulation to Be Used—The cost of refrigeration determines the economic thickness of insulation. Generally speaking, the following thicknesses should prove effective: Temperature differential between exterior and interior surface of insulation and corresponding insulation thickness.

30° F. difference.....	3 in.
40° F. difference.....	4 in.
50° F. difference.....	5 in.
60° F. difference.....	6 in.
70° F. difference.....	8 in.
90° F. difference.....	9 in.
100° F. difference.....	10 in.

Erection Service—For best results insist on Armstrong's Corkboard erected by Armstrong's Construction Department, or authorized agents employing qualified mechanics.

Armstrong's Cork Covering

Armstrong's Cork Covering has been used for insulation of cold lines for approximately thirty years. Its worth has been proved. Coated inside and out with a mineral rubber finish ironed on, Armstrong's Cork Covering is protected against deterioration due to moisture absorption and the dangers of frost. Armstrong's Cork Covering effects a saving of approximately 85% of the refrigeration which would be lost from bare pipes. Accuracy in manufacturing methods and good

application insure a finished job that frequently will outlast the pipe. You should therefore insist on Armstrong's Cork Covering being applied by Armstrong's Construction Department, or our authorized agents.

Forms and Sizes—Armstrong's Cork Covering is supplied in moulded covers for practically all standard, screwed and flanged fittings and in 36-in. split sections for straight pipe runs of the sizes ordinarily used. Armstrong's Cork Covering is made in three thicknesses:

(1) **Special Thick Brine**—For lines carrying refrigerant from 0° to -25° F.

(2) **Brine Thickness**—For lines carrying refrigerant between 0° F. and 35° F.

(3) **Ice Water Thickness**—For refrigerated drinking water lines and others where temperatures are above 35° F.

Armstrong's Cork Covering is also furnished in the form of lagging for the larger sizes of pipes and fittings, beveled to the proper radius; and in any thickness up to 6 in. for the insulation of tanks and other cylindrical cold surfaces.

Samples and Literature—Our book, "Armstrong's Cork Covering," contains complete information and specifications of inestimable value to all users of refrigeration. A copy of this book and a sample of the covering will be sent on request without charge or obligation.

Drinking Water Systems

The refrigerated drinking water system has, in recent years, become firmly established not only as a modern convenience, but as a requisite of economy and efficiency in mills and factories, hotels, office buildings, and other public and semi-public buildings.

Armstrong's Cork Covering in ice water thickness is especially adapted for the insulation of the distributing lines and apparatus. It is neat in appearance, moisture-proof and fire retardant. Its high insulating efficiency insures a minimum use of refrigeration, and its durability is a guarantee of long life in service.

Booklet—A new publication, "Refrigerated Drinking Water for Mills, Public Buildings, Hotels and Office Buildings" contains valuable data on water, power and refrigeration requirements, approximate costs, etc. A copy will gladly be mailed on request.

Special Service

The application of refrigeration to various kinds of equipment, the cost of refrigeration under various circumstances, and other factors make this science so complicated that few architects and engineers can specialize enough to keep step with the progress in the industry. We employ experienced sales engineers whose function it is to keep advised on what is best for each type of installation. We strongly suggest, therefore, that in contemplating a specification you avail yourself of the recommendations and services of our sales engineers. With a thoroughly trained construction force the ARMSTRONG CORK & INSULATION COMPANY is prepared to handle complete contracts of any size for the erection of its products.

CORK IMPORT CORPORATION

Pure Baked Corkboard and Cork Pipe Covering

345-349 West 40th Street, NEW YORK, N. Y.

BRANCH OFFICES AND DISTRIBUTORS IN PRINCIPAL CITIES

Warehouse stocks at New York, Newark, Houston, New Orleans, San Francisco, Los Angeles, Seattle, St. Louis, Chicago

Products

NOVOID CORKBOARD INSULATION—for all cold storage rooms, refrigerators, and the walls and roofs of all kinds of buildings.

NOVOID CORK PIPE COVERING—for all cold lines, tanks and refrigerated drinking water systems.

NOVOID CORK MACHINERY ISOLATION—for reducing the noise and vibration of moving machinery.

Novoid Corkboard

Made in the largest cork manufacturing plants in Spain, the home of cork, Novoid Corkboard is a high grade product with maximum insulating value and structural qualities.

In the making of champagne and fine tapered corks, cork discs for crown caps, cork lined helmets, cork paper for cigarette tips, and cork specialties, only the choicest grades of cork bark are used. The cork waste is granulated and sifted to remove dust and fine particles. Then it is screened and sorted according to the size of the granules and the different sizes of granules are mixed in the proper proportion to produce a close structured board

Double Width (24x36-in.) Sheets of Novoid Corkboard Are Especially Suitable for Insulating Roofs and Floors
They save labor in laying and reduce the number of joints 50%

—small granules between large ones—which eliminates voids in the finished material and makes for greater moisture-resistance and better all around insulation. The cork waste is compressed in moulds, and then baked by a slow and careful process in specially constructed ovens. In the baking process the natural resin binds the cork granules into strong, solid sheets that have *no voids or air spaces between granules*. No foreign binder is used.

Novoid Corkboard is entirely free from hard-back and "green centers." Green or improperly baked centers are disastrous to

any insulating job *after* the corkboard has been installed for some time. A surface inspection will not reveal "green centers" so, to guard against them, Novoid Corkboard is baked in special moulds 25x37 in. in size. After removal from the mould, each sheet is split and then finished full standard 12x36 in. As a result, the center of each sheet is open to thorough inspection by the purchaser and its high quality verified *before* it is installed. Corners and edges are cut true and square, insuring tight joints and reducing to a minimum the labor of erection.

Apple Storage of the Winchester Cold Storage Co., Winchester, Va.

Insulated with Novoid Corkboard

Six-story Factory Building of American Tobacco Co., Richmond, Va.

Insulated with 2-in. thick Novoid Corkboard on walls and roof

Novoid Corkboard Roof Insulation

Used on roofs, Novoid Corkboard prevents the transmission of heat, making a building *warmer in winter and cooler in summer*, saving fuel and adding to the comfort of the building's occupants. *Novoid Corkboard is unaffected by moisture. It is fire retarding, and will not smolder.*

Double Width Novoid Corkboard

Novoid Corkboard in the 24x36-in. size is as easy to handle as the usual 12x36-in. sheets. Every board covers twice the area and there are only half as many joints between the sheets when laid. In this way the chance of joint leakage is reduced 50%.

Double width Novoid Corkboard provides permanent insulation that never warps, shrinks, or buckles, and makes an ideal base for roofing. Packed in handy cartons, these 24-in. sheets save time, are handled quickly, and go down with an appreciable saving in labor.

NOVOID CORKBOARD

*One size packed to a carton.

Novoid Cork Pipe Covering

This companion product to Novoid Corkboard is made in three thicknesses; *Heavy Brine*, for temperatures below 0° F.; *Brine*, for temperatures from 0° F. to 25° F.; *Ice Water*, for temperatures above 25° F.

Novoid Cork Pipe Covering is used for covering all brine and ammonia lines, wherever located, and for insu-

Novoid Cork Covering and Fitting Jackets

Made in three thicknesses for all sizes of pipes and fittings in general use

lating the ice water lines of refrigerated drinking water systems in hotels, office buildings, and factories. The accurately moulded, mineral rubber coated, sections fit

Novoid Cork Covering on the Refrigerated Lines in the Plant of Foremost Dairy Products, Inc., Charlotte, N. C.

pipes tightly leaving no spaces in which moisture might accumulate, freeze and disrupt the insulation.

Novoid Cork Covering is made of pure cork. Its insulating efficiency is permanent as it will not absorb moisture.

For covering all fittings Novoid Cork Fitting Jackets are used. These cork jackets are moulded to fit closely so that no air spaces will exist between the fittings and the insulation.

For covering tanks we recommend the use of Novoid Cork Lagging.

Novoid Cork Machinery Isolation

Novoid Cork Machinery Isolation provides an economical and effective means of reducing the noise and vibration produced by fans, motors, pumps, engines, presses, and practically all other kinds of moving machinery.

Being made of pure cork it will not absorb moisture and does not rot. Furthermore it will not harden or take a permanent set, but retains its resilience indefinitely.

Novoid Cork Machinery Isolation is made in three densities—Light, Medium and Heavy—which provide a proper material for use under practically all conditions of service.

BABCOCK-DAVIS CORPORATION

Mortuary Slides, Special Blanket Warmers, Bed Pan Racks, Sanitary
Legs and Cabinets

474 Dorchester Avenue
BOSTON, MASS.

For Our Other Pages, see Manufacturers' Index

BABCOCK-DAVIS SELF-SUPPORTING FULL LENGTH MORTUARY SLIDES

Patent Applied For

Mortuary racks and trays shown here and manufactured by us were carefully designed for rigidity, ease of operation and accessibility. They are self-supporting and insulating is not damaged in erection.

Heavy ball bearings are placed in every moving part so that the racks will move with the least possible effort.

With our equipment, when it is desired to view the cadaver, the easy moving ball bearing carriage is drawn out with tray on it fully supported its entire length. The tray remains in a horizontal position and is not released unless it is desired to remove it.

Trays cannot be pulled off the carriage accidentally. They are arranged so that at no time is it possible for

fluids or acids to flow towards the head; thus eliminating head rests. The entire rack is hot galvanized, double dipped.

All ball bearings are enclosed so that moisture or dampness cannot reach them.

The trays are manufactured in one piece and can be used for a stretcher; also they can be put on the carriage either way.

If you have any special problems, our engineers would be glad to confer with you.

Right:

Part of Battery of 15 Mortuary Racks Showing Trays Extended in Various Positions at Admission Building, Sanatorium Division, Mattapan, Mass. Boston City Hospital

Below:

Tray Removed to Show Sturdy Construction of Tray Support and Guides

Specification

Each opening shall be equipped with a removable mortuary tray telescoping track and rigidly braced tray carriage as manufactured by BABCOCK-DAVIS CORPORATION, 474 Dorchester Avenue, Boston, Mass.

Tray—Shall be formed of No. 18 gauge iron over a continuous pipe frame which also forms handle full width of pan on each end.

Each tray shall be 31½ in. deep and of welded construction.

No rivets, heads, or crevices inside the pans to allow acids to accumulate.

Trays are to be set so acids will not collect at head of cadaver.

Tray Carriage—Shall be rigidly braced and equipped with ball bearing guides and rolls to support pans. Trays shall be locked in position on the carriage so that they cannot be pulled off of carriage until patented spring latch on front of carriage is released.

Tracks—Shall be of the Babcock-Davis progressive extension type affording complete support of tray for its entire length of travel and being equipped with specially designed ball bearings in bronze rollers. Shall be practically frictionless in their operation.

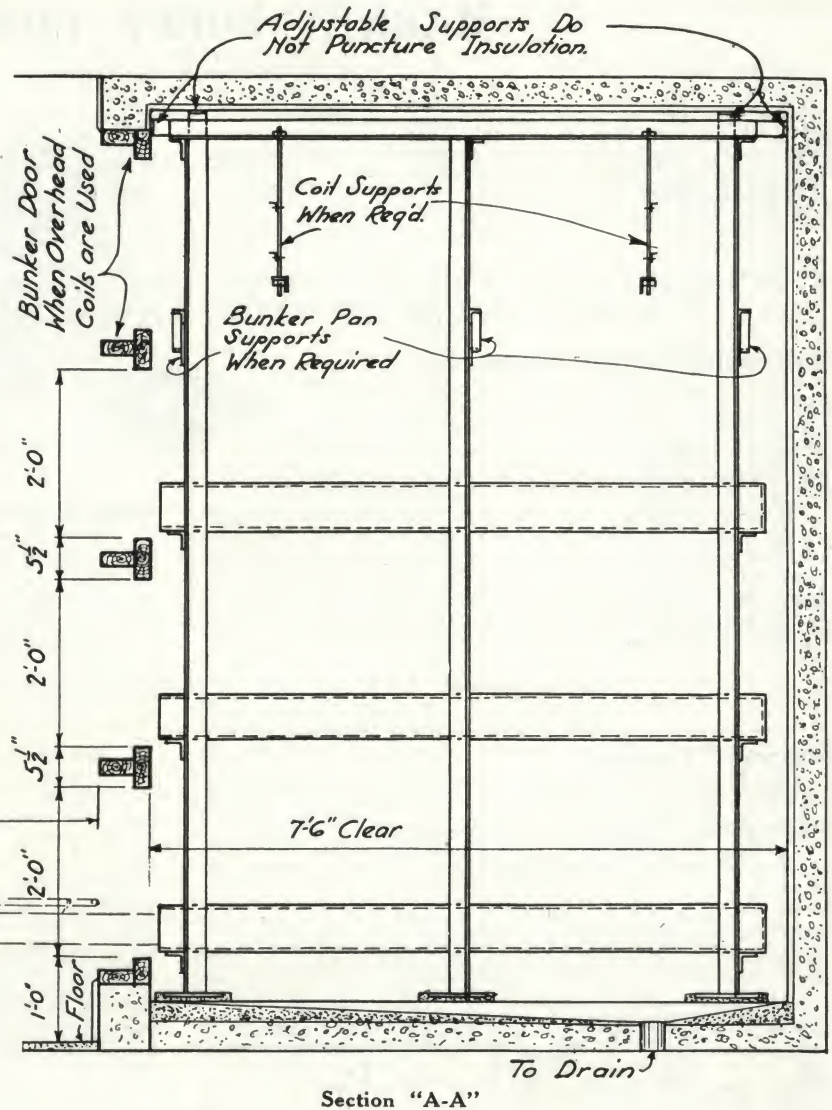

The tracks shall be equipped with rubber stops to insure quiet operation.

Supports—Shall be of angle iron construction held in position without puncturing the insulation in any way.

Note: Should the refrigerating system require overhead coils, track supports which can be extended to support the coils and bunker pans may be specified.

All parts shall be heavily hot galvanized to prevent corrosion and special composition bronze shall be used on rolling parts to insure the longevity of the mechanism.

The refrigerator front, insulation, equipment, construction of the coils and chest, are not in this contract.

SPECIALISTS IN SANITARY SPACE SAVING INTERIOR EQUIPMENT FOR ALL TYPES OF REFRIGERATION STORAGE AND GENERAL STORAGE

Refrigeration Storage Equipment

The MARKET FORGE COMPANY was founded in 1897 and has since that time gradually and carefully developed its original line of refrigerator shelving to include the most complete, thoroughly satisfactory and practical designs to meet the needs of any and all types of refrigeration storage requirements.

Walk-in shelving; reach-in shelving; hook rails; cork insulated baffles; combined bunker equipment and coil supports; insulated and plain front drawers of all types, for all purposes; cheese drums; oyster and pastry pans; complete garde manger equipment. Drip pans and coil supports, fur storage racks and trucks, mortuary racks and trucks, rug storage racks.

The general and widespread acceptance of this equipment

has led the MARKET FORGE COMPANY to develop equally desirable products for general storage requirements.

There is now a standard type "Maforco" storage equipment to serve every conceivable storage requirement.

General Storage Equipment

Trunk storage racks; picture storage racks; tapestry racks; silver storage racks; florist fixtures; department store shipping room racks and trucks; hotel and hospital storeroom shelving; expanded metal and wire mesh partitions; linen room shelving and counters; and coffin storage racks.

Metal tables, trucks and skids for handling all material.

"MAFORCO" WALK-IN REFRIGERATOR EQUIPMENT

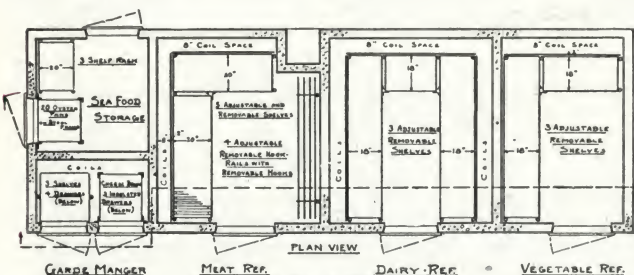

All Supports and Fittings Designed to Eliminate Puncturing of Insulation

Distinctive Features

Rigid and self-supporting, eliminating anchorage to refrigeration construction. This avoids puncturing of insulation and resulting disintegration. Racks assembled without bolts.

Vertical adjustment of post brackets to meet any need.

Shelves are continuous angle-bound units of strong construction. Straps are 1 in. wide, 1 in. apart, flush riveted to frame with edges well rounded and chamfered. It is vitally important that you insist upon riveted shelves. This construction leaves the slats permanently in place and should one come off, it can easily be repaired. Spot-welding is not satisfactory

Typical Plan and Elevation of Refrigerator Layout Where Wall Coils Are Used

for the slats come off easily, particularly after the action of hot galvanizing, and are difficult to repair in the field. Slatted construction permits a free circulation of air. Shelves are also furnished perforated or solid as desired. Standard finish, hot galvanized; also furnished in monel or Allegheny metal.

Posts are round, set on liberal diameter floor flanges and neatly finished with acorns.

Typical Shelf Rack

Shimming under posts is avoided by vertical adjustment of brackets to meet slope of floor.

Valuable refrigeration space is conserved because the equipment fits snugly into all corners and every inch of space is available.

Rail rack uprights are expanded between floor and ceiling. Indestructible rail brackets of stamped steel are vertically adjustable, also removable without disturbing uprights. Hooks are removable or rigid, as desired.

Where wall coils occur, "Maforco" cork insulated galvanized steel baffle boards supported by shelf posts are recommended.

These shields assist circulation of cold air—making the refrigerator more efficient, protecting products from the coil frosting and at the same time providing a stop at the rear of the rack.

"Maforco" equipment is all heavily hot galvanized after assembly, except meat hooks, which are tinned.

Wall Coil Supports

"Maforco" coil supports satisfy the demand for a simple economical method of hanging coils. By their use valuable refrigerator space is conserved since it is possible to bring coils nearer the wall than by old methods.

Coil brackets are furnished with 1/4-in. iron pipe size uprights expanded between floor and ceiling, eliminating puncturing of insulation.

This construction does away entirely with built-in supports and expensive special work.

Coil brackets are made to carry pipe coils of any size with hook offset, so drip will not run down the upright. Same type of clamp is furnished with hooks to carry special sections and drip pans. Standard brackets are also available to carry baffles on same posts.

Typical Installation

"MAFORCO" REACH-IN REFRIGERATOR EQUIPMENT

Distinctive Features

Drawers operate upon ball bearing extension supports and may be withdrawn their full length outside the front of refrigerator and yet remain in a horizontal position. Galvanized ball bearing steel wheels turning on bronze axles are attached to the sides of each drawer. Wheels ride in hot galvanized telescoping channel construction rigidly attached to hot galvanized substantial angle frame. Insulated front drawers are provided with 2-in. cork insulation sealed in sheet metal. All drawers constructed of galvanized sheet iron or monel metal soldered watertight.

Drawers are furnished with perforations in the sides—also perforated false bottoms if desired. Front has overlapping galvanized steel plate for attaching wood facia and gasket. (Wood facia and gaskets not included by MARKET FORGE COMPANY.)

Insulated Front Drawer
Cabinet Type 113

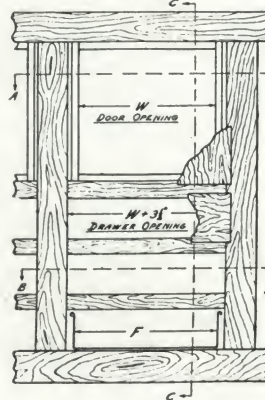

Where shelves are furnished over drawers, they are of "Maforco" standard slatted construction with no side angles and have front angles turned down to provide a stop, and back angles turned up to permit free sliding of shelves on angle bearers. This also prevents stored stuffs falling in back of refrigerator.

The shelf separating drawers and slatted shelves is of solid sheet metal to avoid any dripping into drawers below.

Oyster or pastry pans, as shown, are made of galvanized sheet steel or monel metal with double bent top edge soldered watertight if required. Pastry pans regularly furnished 7 to a half door, oyster pans, 10 to a half door. "Maforco" galvanized angle framework construction is applicable where all shelves, drawers, pans or any combinations are required. Framework is self-supporting but is provided with holes in front angles so that it may be fastened to inside face of door frame to insure rigidity.

Oyster or Pastry
Pan Cabinet
No. 109

STOCK SIZES OF DRAWERS

WIDTHS "F"	18", 24", 30"
LENGTHS "E"	18", 24", 30"
DEPTHS "D"	6", 8", 10"

Any combination of width, length, and depth may be had
Special sizes made to order

$$W = F - \frac{1}{2} \quad D = d + \frac{1}{2} \quad A = E - \frac{1}{2}$$

For drawers below with shelves above—
 $H = X + 6" + (\text{No. of drawers})(D + 2\frac{1}{2})$

For all drawers—
 $H = \frac{1}{2} + (\text{No. of drawers})(D + 2\frac{1}{2})$

Standard Construction of Refrigerator Fronts to Fit Standard "Maforco" Cabinets

Fits stock cold storage door sizes

Unless otherwise specified, "Maforco" equipment is furnished hot-galvanized. As an alternate we use and advocate monel metal or Allegheny metal.

The importance of proper handling and storage of food can not be overemphasized; "Maforco" equipment in every detail lends itself to all requirements.

Specify—"Maforco" Refrigerator Equipment as made by the MARKET FORGE COMPANY, Everett, Mass.

"MAFORCO" VERMIN-PROOF SHELVING AND SUPPORTS FOR FINEST INSTALLATIONS

Originally designed for those who seek the finest type of shelving made, its many desirable features have led to a generally popular demand for its use in better grade projects.

Made of polished monel metal in gauges proportioned to size of shelves. All edges doubled and soldered at all joints.

Brackets of stamped monel metal vertically adjustable on posts.

Generally used for reach-in shelving. The same design

has been and is readily adaptable for those who require a superior class of equipment for walk-in refrigerators.

Supported on monel metal tubular posts expanded between floor and ceiling. All fittings and brackets of polished monel metal.

Other types of rust-resisting metal may be adapted to this construction.

In this respect the industrial shapes and sizes available of material to be used should be borne in mind.

IMPROVED TYPES OF "MAFORCO" STANDARD REACH-IN SHELVING

Aluminum Rod Shelf

Desirable construction for hospital work. Furnished with $\frac{1}{4}$ -in. or $\frac{1}{8}$ -in. rods $1\frac{1}{2}$ in. on centers machine riveted to flat stock aluminum end bars. Exceptionally strong and attractive

Slatted Shelf

Standard "Maforco" Slatted Shelves have 1-in. wide slats with 1 in. space between. Front angle has flange down to act as a stop and back angle with flange up to permit free sliding on angle bearers, also to prohibit stored stuffs dropping in back of refrigerator

Welded Wire Shelf

A light strong shelf made with wire electrically welded 1 in. on centers to frame. Finish hot-galvanized or tinned. This type of shelf is especially desirable where monel metal is required. Its strength and light weight make for the utmost in economy

"MAFORCO" IMPROVED DESIGN BUNKER EQUIPMENT

Affords Longer Life at Less Cost and Eliminates Puncturing of Insulation

All equipment is adjustable and removable—a very valuable feature allowing ready access to refrigerating equipment repairing service. Expensive built-in work is entirely avoided and the use of hot-galvanized material throughout insures long life at the lowest cost consistent with sensible economy.

Uprights are of 1½-in. iron pipe size rigidly expanded between floor and ceiling. Uprights run side walls spaced approximately 4 ft. on centers.

Longitudinal angles "A" supported by angle bearing brackets carry heavy cross angles "B" through which are bolted hangers for lower angles "C" on which refrigerating equipment is supported. Threads on trapeze rods allow for liberal vertical adjustment.

Bunker pan is furnished as shown in section. Construction eliminates any possible sag between supporting angles. Bunker pans and baffles are carried on angles "D" resting on vertically adjustable angle bearing brackets.

STANDARD CONSTRUCTION "MAFORCO" BUNKER PAN & BAFFLE FOR SINGLE OR DOUBLE CYCLE CIRCULATION

Section Through Bunker Pan and Baffle

Adjustability of brackets, angles supporting bunker pan, provides necessary tilt for proper circulation, approximately ¾ in. per ft.

Bunker pan is watertight and furnished with threaded outlet ready for attachment of drain pipe.

Width of bunker depends upon allowance for cold and warm air flues. We suggest a cold air flue allowing 1½ in. per ft. of cooler width and 1 in. per ft. warm air flue. This

Plan

Typical Refrigerator Layout Showing Combined "Maforco" Storage Racks and Bunker Equipment

Typical Bunker Pan Complete with Baffle Board and Coil Supports for a Single Cycle Box

same type of construction is readily applicable to rooms requiring double cycle construction.

For reach-in boxes the same construction may be used. Also the same uprights may be used to carry "Maforco" shelving, thereby effecting a considerable saving.

Likewise same uprights used for supporting the bunker pan construction in walk-in boxes are also used to support rail racks and shelving where specified.

In addition to economy and satisfactory design, your attention is further directed to the very fine appearance of a box equipped completely with "Maforco" all-steel hot-galvanized bunker pan construction and shelving.

Where available ceiling height permits it, always use overhead location of refrigerating equipment.

This assists circulation and good circulation is one of the vital requisites of proper refrigeration.

For the finest installations specify monel metal lined and covered "Maforco" bunker equipment.

We suggest you specify "Maforco" bunker pan baffle

Section Through Double Bunker Pan Baffle and Racks

"A"—1 in. per foot of refrigerator width
"B"—1½ in. per foot of refrigerator width

board and coil support equipment as made by the MARKET FORGE COMPANY, Everett, Mass., wherever overhead coils are possible.

Elevation

"MAFORCO" EQUIPMENT FOR FUR STORAGE

All Equipment Designed to Allow Maximum Storage Capacity with Every Garment Readily Accessible and Protected from Damage in Handling

Single post construction, made possible by the use of "Maforco" fur fixtures, makes for the utmost in simplicity, economy of construction and low cost of erection.

Expensive pipe fittings are entirely eliminated; single posts also allow greater trucking space. Brackets are vertically adjustable for any desired spacing. Brackets added or removed without disturbing uprights.

Centers of robe rails made 24 in. for double brackets and 12 in. for single brackets.

Posts expanded between floor and ceiling eliminate puncturing of insulation. Posts are 1½-in. iron pipe size. Robe rails, 1¼-in. iron pipe size.

For ceiling heights from 14 to 20 ft. 2-in. iron pipe size uprights should be used. On greater ceiling heights up-

A Typical Installation of Fur Storage Racks

rights should be proportionately heavier.

Ends of robe rails are neatly finished with end caps serving the double purpose of stopping garments from slipping off the ends of rails and giving the equipment a finished appearance.

All equipment is built to eliminate projecting sharp corners, thus avoiding any possibility of damage to garments when handled in the vaults.

Posts are expanded between floor and ceiling avoiding puncture of insulation.

Do not puncture insulation to support sprinklers, ducts, and electric conduit. Same posts carrying fur storage racks provided with single and double angle bearing brackets are readily furnished with light angles laid out to carry this equipment.

Standard Layout Practice

In many vaults, where space is sublet to individual users, separate compartments are economically and readily made available by the use of expanded metal partitions. The same posts which carry the fur storage racks are provided with special stamped steel brackets to which partitions are rigidly clamped.

To simplify loading and unloading upper tiers we recommend our standard fur storage hoist. This is manually operated and equipped to automatically stop at any desired height.

Construction allows relocation of equipment to suit revised space requirements.

In planning vaults make the rack layout first and from this work out wiring, duct, and sprinkler system.

Expansion Fitting

Top Flange, Lock Nut, and Bottom Flange

Bracket for Close Mounting

Posts adjacent to walls furnished with half round top and bottom flanges. Other posts with full round flanges

Hot Galvanized Finish on "Maforco" Equipment

We unconditionally advocate the use of hot galvanized finish throughout and unless otherwise specified "Maforco" Equipment is so furnished.

"MAFORCO" MORTUARY EQUIPMENT FOR HOSPITALS, MUNICIPAL MORGUES, AND MEDICAL SCHOOLS

Slides and Trays

Each compartment is equipped with removable telescoping tray carriage operating on ball bearing wheels in substantial steel frame. Framework is rigidly secured into place without puncturing of installation.

Tray of one-piece galvanized sheet steel or monel metal bent over continuous galvanized pipe frame with a handle formed at each end. No rivets pass through the body of the tray, thus eliminating all crevices leading to the accumulation of acids; tray rides on steel rollers. Frame, slide and tray are all heavily hot-galvanized. This is a most vital feature to consider where cadavers handled are mutilated or where death has occurred from a contagious disease.

Tray operates on telescoping carriage in such a manner that it may be withdrawn its full length and will remain in horizontal position without sagging. Tray is provided with handles the full width of both ends, for use as a stretcher. Units are furnished to slide one way, two ways, or sideways.

Ends of tray and carriage when slid back into position strike rubber bumpers thus insuring quiet operation.

Cook County Morgue, Chicago, Ill.
Capacity 135 cadavers

Where overhead coils occur we suggest the use of "Maforco" bunker pan equipment in conjunction with the mortuary units. There is the two-fold advantage of more desirable construction simpler to install yet low in cost.

Every morgue large or small for human or animal storage presents a different engineering problem. Let the MARKET FORGE COMPANY as specialists work with you.

"Maforco" Tilting and Tray Carrying Mortuary Trucks

Designed especially to eliminate unnecessary handling of cadavers on and off of trays. Tilting type truck No. 525 especially desirable for use in viewing room of municipal and large hospital morgues.

Regularly furnished mounted on rubber tired wheels and finished hot-galvanized or in baked-on white enamel.

"Maforco" Tray Carrying Truck No. 526

"Maforco" Tilting Mortuary Truck No. 525

Both types built to carry standard "Maforco" Mortuary Trays

General Information

All mortuary racks are built in sizes shown carried in stock ready for immediate shipment. Refrigerators should be built to conform with these specifications. Units are designed to conform with standard cold storage door sizes thereby lowering costs through the use of standard equipment and eliminating delay of securing special sizes.

Style No. 1 shows method of supporting the type which slides one way, by lagscrewing the front end to the inside of the door frame and the rear end to studs.

Style No. 2 construction shows mortuary units supported in rear by attachment to brackets vertically adjustable on 1 1/4-in. iron pipe size uprights expanded between floor and ceiling. If desirable, same construction may be used at both front and rear.

Style No. 3 unit is the type that is furnished to slide both ways. This makes it practical to have the mortuary refrigerator installed between the receiving room and the post mortem laboratory. The cadaver is then readily accessible from either room at a saving of much time and labor.

Style No. 4 is the unit which operates from the side. Many times space available does not permit the use of the end operating units. We advocate, however, the use of end operating units wherever possible.

Where installations are more than two units high the upper units are made accessible by means of a tiering machine furnished with a roller platform.

Furnished with crank for manual operation or with 1/2 hp. motor and equipped with automatic stops. Machine is mounted on rubber tired wheels making it readily portable. Finished in baked-on white enamel.

Portable Refrigerating Body Boxes

For small installations, funeral homes, etc., we recommend two-body capacity portable boxes with self-containing refrigerating unit. This eliminates the need of running pipe lines to the morgue storage space and keeps the body storage separated as it should be.

Boxes are cork-insulated, metal lined and covered, and are furnished to take sidewalls or overhead cooling apparatus, preferably the latter, as shown.

Equipment is standard "Maforco" mortuary racks, end operating type, with galvanized or monel metal trays as specified.

"MAFORCO" CRYPT RACKS FOR COFFIN STORAGE

Racks are of angle iron uprights substantially gusseted and reinforced. Coffins slide on 1-in. tube rollers provided with ball bearings at each end.

End operated units are most practical, but where space available warrants it, side operated units are also furnished. Standard size racks are shown. Special sizes also may be secured.

All equipment is hot galvanized after fabrication and may be painted in the field to match finish.

All equipment is self-supporting, requiring no anchorage to walls, floor or ceiling.

Where installations are more than two units high, the upper units are made accessible by means of hand or electrically operated 500-lb. capacity tiering machine designed especially for this type of storage.

Specify "Maforco" Crypt Racks for coffin storage.

"MAFORCO" LINEN ROOM SHELVING AND COUNTERS

Front uprights are 1¼-in. pipe equipped with cast brass nickel-plated sanitary base (fitting No. D9), which allows vertical adjustment with no threads showing or crevices for dirt and vermin to collect.

Rear uprights are 1¼-in. pipe furnished with flush socket elbow flange to provide for attachment to angle framework set in walls.

This construction keeps material away from walls and allows plenty clear space for cleaning.

Aluminum shelves are made with 1-in. aluminum tube frames with ¼-in. aluminum rods spaced 1½ in. on center. Shelves rest on pressed steel section rigidly welded to uprights. They are removable and exceptionally light and easy to handle.

Shelves are furnished in natural finish. All other parts with one coat of flat white enamel baked on.

Monel counters are of No. 20 gauge polished monel rolled over No. 16 gauge galvanized iron, supported on front and rear legs similar in design to shelving.

Alternate layouts with shelves over monel counter also practical where space available is limited.

Specify "Maforco" linen room shelving and counters for linen rooms.

"MAFORCO" TRUNK STORAGE

For Use in General Storage or with Expanded Metal Compartments for Individual Storage

Uprights $1\frac{1}{4}$ -in. outside diameter tube expanded between floor and ceiling. Shelves of sheet steel with reinforced edges are supported by means of malleable iron brackets vertically adjustable on the uprights. Shelves are readily removable. Standard size 4x3 ft. wide. Other sizes to conform with conditions. Furnished to conform with contour of room making "U" or "L" shaped racks, eliminating inside corner posts by means of a special fitting. This allows full sweep around all corners with no interfering posts.

Trunk Rack Tubular Construction

Four-way brackets at junction of four shelves and double brackets at junction of two shelves allows installation of racks in two or three sections in width and any number of sections in length. Shelves may be spaced on any desired vertical centers but for trunk storage we suggest 30-in. centers. To simplify loading and unloading shelves many users favor a roller along the front line of shelves. A slightly more economical design of trunk racks is effected by the use of angle iron uprights instead of tubular uprights. If this construction is used all fittings are eliminated and shelves are furnished to bolt in place. Uprights are punched 2 in. on centers to allow for vertical adjustment. Same type of roller is furnished where required.

Section Through Shelf Showing Application of Roller

Many times large spaces equipped are allotted to individuals or separate business houses. Either type of "Maforco" Trunk Rack lends itself readily to answering this requirement by the use of expanded metal partitions. They are clamped to the uprights by means of standard clamps and do not in any way interfere with the storage space.

Oval head carriage bolts hold partitions rigidly in position, all nuts are on inside of compartments thereby formed obviating the possibility of tampering by others. This construction permits separating individual shelves or entire tiers of shelving for separate users. Doors are furnished with approved cylinder locks, each with two keys and mastered if desired. Hasp is provided for use of additional padlock if specified.

Finish—We cannot advocate too strenuously the desirability of hot-galvanized finish for all storage racks. It does not scratch or mar readily and lasts indefinitely. It costs slightly more than an enameled finish but is well worth the small additional investment involved. As an alternate, all racks may be finished in either air-dry or baked-on high gloss enamel.

"MAFORCO" RUG STORAGE RACKS

The desirable features of single post construction are well illustrated in connection with "Maforco" Rug Storage Equipment.

Cantilever brackets single or double arm are vertically adjustable and removable. Standard single brackets 30 and 36 in. Standard double brackets 60 and 72 in.

Solid sheet steel shelves are removable and vertically adjustable on the cantilever brackets. Standard length shelf 5-ft. width to suit brackets.

Pipe uprights varying in size according to ceiling height, are rigidly expanded between floor and ceiling.

Utmost care has been used in the design of this equipment. There are no sharp corners to mar rugs. Any size rug may be stored. Construction makes available tiers of continuous open shelving with no crevices between shelves easily loaded or unloaded.

Finish hot-galvanized throughout.

Specify—"Maforco" Rug Storage Racks as made by the MARKET FORGE COMPANY, Everett, Mass.

Installation Rug Storage Racks—Lincoln Storage Warehouse, East Orange, N. J.

"MAFORCO" UPHOLSTERED FURNITURE RACKS

Standard "Maforco" post fittings and brackets have been readily adapted to the most economical and practical type of upholstered furniture racks built.

Posts are $1\frac{1}{4}$ -in. iron pipe size, expanded between floor and ceiling. Shelves are of galvanized sheet iron built-in sections as shown for strength, ease of handling and installation.

Shelves rest on angle iron bearers bolted to cast iron brackets vertically adjustable to any desired spacing.

Standard size sections are 6 ft. x 6 ft. wide. Other sizes may be furnished to suit requirements.

There are no sharp corners to injure or mar in any way stored materials.

Standard finish of racks throughout hot galvanized. For obvious reasons there is no other finish so completely desirable.

ELEVATION

"MAFORCO" HEAVY GENERAL STORAGE SHELVING

For Hospitals, Hotels, Schools, Institutions, Warehouses, and Manufacturing Plants

For heavy duty storage the usual type of commercial shelving is not rugged enough. The MARKET FORGE COMPANY has adapted its standard posts, brackets and fittings to satisfy this common requirement. It is not only the heavy loads carried that makes this heavier type of shelving necessary but years of rough abuse it must withstand.

"Maforco" construction allows vertical adjustment to the last fraction of an inch. Ordinary steel shelving is not adjustable to this fine point. This means in many cases inches of valuable space lost at every shelf. When you multiply this by total shelf areas the loss is amazing. Space in any building, anywhere, is valuable and should not be wasted.

Racks are built with shelving having all "loose" corners with posts expanded between floor and ceiling or furnished with "tight" corners where necessary, to make self supporting where posts cannot extend to ceiling.

Furnished any number of sections long, wide or any number of shelves high. Racks readily furnished to fit around wall projections or in any shape room.

Shelves made in any width up to 36 in. and in any length up to 6 ft. to suit individual requirements. They are vertically adjustable and removable. Shelves over 24 in. wide are reinforced longitudinally with a stamped steel channel shaped member.

Posts are of 1¼-in. outside diameter tubing of heavy gauge. All brackets are malleable castings.

Shelves of galvanized sheet iron, all other parts hot-galvanized after fabrication.

Standard Post Fittings

justable and removable. Shelves over 24 in. wide are reinforced longitudinally with a stamped steel channel shaped member.

Typical Layout of Hospital Kitchen Storage for Canned Goods

"MAFORCO" EXPANDED METAL PARTITIONS

Many users of "Maforco" storages find it exceptionally economical and convenient to divide storage space into individual compartments by means of "Maforco" expanded metal partitions.

The advantages are manifold and exceptionally so in the case of refrigerated space.

Large areas can be insulated and refrigerated, then divided for individual users at a relatively very low cost. The saving in doors, insulation and refrigeration is readily apparent.

All "Maforco" racks are designed to permit application of this equipment. All parts are standard, avoiding special work. Construction permits of relocation or adjustment at any time, yet users are as thoroughly protected as if in an entirely separate compartment.

Different types of installations require different sizes and gauges of expanded metal. Submit your requirements to the MARKET FORGE COMPANY and let our engineers work out a proposal for your consideration.

SPECIAL "MAFORCO" FITTINGS AND FIXTURES

Our many years of close connection to this specialty field has led to the development of many special types of fittings and fixtures of sanitary and adjustable nature.

Fittings D9, D10, L13 and D14 are exceptionally fine for hospital, hotel and kitchen equipment work. They permit adjustment with no exposed threads and are verminproof. Their uses for tables, racks and stands are readily seen and need not be itemized here.

"Maforco" Telescoping Slides with Ball Bearing Rollers

The fittings in the opposite column are made for any size pipe or angle. Furnished in cast iron, cast brass, white metal, monel metal, and nickel or chromium plated and polished as desired.

Typical Section Through Sink Support

Utility Brackets

Wherever heavily loaded drawers are required specify them to be equipped with "Maforco" telescoping drawer slides. Their use permits easy operation and allows drawers to be withdrawn full length without sagging.

Slides are made in black iron, enameled or hot-galvanized after fabrication, or of monel metal, with chromium plated ball bearing rollers.

Guarantee and Facilities

Victor shelving has behind it our regular guarantee against defective materials and workmanship and to satisfactorily do the work for which it was intended.

The Victor plant is located in the heart of Maryland, excellent railroad facilities to all points.

A large stock of Victor standard products is always available for immediate shipment.

Steel Shelving

Victor standard steel shelving equipment comprises practically every type and kind of equipment required for the handling and storage of articles in cold storage from meats and vegetables to furs, rugs or flowers.

Victor steel shelving can be purchased very economically. It is extremely easy to erect and the shelves and racks are vertically adjustable. Additions can be made without disturbing your present equipment.

All equipment is galvanized after assembly to prevent rust, uprights and robe rails of fur racks are made of high carbon steel tubing. Supporting brackets are pressed steel or malleable iron. Shelving is made of $1 \times \frac{1}{8}$ in. steel flats spaced 1 in. apart and riveted to angle irons.

How Furnished—Shelves can be furnished either single or double section as desired but we do not recommend that any single shelf be more than 7 ft. 6 in. long. Furnished any number of shelves high. If shelves are to be only 2 or 3 shelves high we recommend that posts

Victor Shelving Along Two Sides of a Room

shown in illustration here. Shelves could be extended to third side of room if desired (see typical layout following page). Shelves are so constructed as to fit close to walls leaving no cracks behind through which produce can fall.

Where space will permit shelves in the center of refrigerator, the style of rack shown below gives maximum storage capacity with no loss of space. Can be furnished as single shelf if desired to a maximum of 2 ft. 6 in. wide. This type shelf gives access from either side, and insures rigidity. Racks can be furnished to any length desired and any number of racks high.

A Victor Double Section

Victor Refrigerator Shelving

Meat Rails and Brackets

Meat rails and brackets for use where it is permissible to attach direct to walls. Bracket extension, flush 3, 6, 9 and 12 in. from wall. Meat rack sup-

ported by posts expanded between ceiling and floor. Brackets are vertically adjustable and have the same extensions as the wall type brackets. $1\frac{5}{16}$ in. posts for heavy duty. Rails either $1\frac{1}{2} \times \frac{3}{8}$ in. or $2 \times \frac{3}{8}$ in. Hooks either loose; attached with setscrews or riveted.

Expansion Stud

Detail of expansion stud used on shelves, meat racks, fur racks, etc. Stud is made cast brass and provides 2-in. expansion, giving ample space for adjustment. This device eliminates necessity of puncturing insulation and plaster.

Detail of Shelving

Victor steel shelving is made of angles with 1 in. by No. 12 gauge straps riveted 1 in. apart and mounted on vertically adjustable brackets. Shelves are galvanized after assembly. They can be lifted out for cleaning without use of tools of any kind. Illustration at left

shows a typical arrangement of shelving and meat racks. Standard shelving can be made to fit any character or shape room and can be any number of shelves high. Note how closely shelves fit to walls.

Fur Racks

Fur racks are also part of our standard products furnished to meet any condition.

We manufacture a complete line of fur storage equipment, including lifts, garment trucks and racks, walkways, etc.

Engineering Service

The Victor Refrigeration Engineering Service is available to you, without cost. We are only too glad to give you the benefit of our years of experience on any problem of shelving or refrigeration equipment. Of course you will not be obligated in any way.

Catalogue and Co-operative Service

Architects and builders are invited to write for Bulletin No. S-28 which contains complete data and information pertaining to all clothes dryers and laundry appliances which we manufacture. Mailed free on request. Our engineering department is at your free disposal.

Scope of Use

Especially adapted for use in residences, apartment buildings, schools, clubs, colleges, gymnasiums, hotels, hospitals, sanitariums and institutions of all kinds.

Dryer Measurements and Sizes

All our dryers when equipped with racks or draws are built to order. These dryers (with exceptions as noted under illustrations) are generally built 7 ft. high and 7 ft. long, exclusive of the space where the racks pull out. When necessary, can vary the above measurements to suit conditions. Framework of each dryer is made of 1/8-in. thick angles of suitable size, firmly and substantially bolted together. Casing is of best quality galvanized sheet steel. When so specified, casing may be made double with air space intervening or double and interlined with sheet asbestos.

Front panels of racks are all made double and lined with sheet asbestos. Brackets of panels are equipped with all metal rollers with self-lubricating bearings or ball bearing type if so preferred.

Ventilated Hanging Bars

The bars on which the clothes are hung consist of *specially galvanized* tubular pipe. These bars are *ventilated* so as to prevent overheating or injury to the most delicate fabrics.

Racks or Draws

In order to meet various specifications, we can supply Dryers equipped with rack panels of various widths, viz: 7, 9, 12, 18 and 24 in. Except for special requirements, we recommend rack panels 9 in. wide. Each rack with 9-in. panel, unless otherwise specified, is provided with six bars on which to hang clothes. When dryer is built 7 ft. long, this provides a hanging capacity of 39 lin. ft. for each rack. When built 6 ft. long, it provides hanging capacity of 32 1/2 lin. ft. for each rack.

When dryers are built 7 ft. long, the total length over all when the racks are pulled out is 13 ft. 10 in.

Ventilation

Clothes dryer designated as "Chicago-Francis" indicates that it is a "Chicago" Dryer, equipped with our "Chicago-Francis" patented heating and ventilating system, which has been perfected and is used exclusively on dryers manufactured by us. With this ventilating system, we secure and maintain at all times a natural and constant circulation of air, and the moisture is carried away with minimum loss of heat, thus insuring maximum efficiency.

WIDTH OF DRYERS, NUMBER OF RACKS AND DIMENSIONS

Number of racks	Racks or draws 7 in. wide	Racks or draws 9 in. wide	Racks or draws 12 in. wide
2	21 in.	25 in.	31 in.
3	28 in.	34 in.	43 in.
4	35 in.	43 in.	55 in.
5	42 in.	52 in.	67 in.
6	49 in.	61 in.	82 in.
7	56 in.	70 in.	94 in.
8	63 in.	82 in.	106 in.

Widths are exclusive of laundry stove.

For gas heated dryers, provide a 3/4 or 1-in. gas supply, depending on size and number of dryers used.

Type S.C. (Self-contained) Rack

The illustration No. S.C. 296 on following page shows dryer equipped with what is known as our *self-contained rack*. With this type of rack, the overhead track system on the outside of the dryer is completely eliminated.

With the self-contained type of rack construction, the inside of dryer at top is provided with a heavy galvanized angle track made with 1/8 and 3/16 in. thick angle irons. This track is provided with antifriction metallic ball bearing rollers upon which the racks operate. The racks may be pulled out or pushed into the dryer with the utmost ease. The track construction is so made that when the racks are pulled out, even their full length, the rack retains its rigidity. The various dryers shown in illustrations with outside overhead tracks, can be supplied with Type S.C. Racks, when so specified.

Patents Pending

Type S.C. Chicago-Interior Gas Heated Dryer

Equipped with Type S.C. (Self-contained) Racks.
Standard sizes as follows:

Dryer No.	Contains	Height, in.	Length, in.	Width, in.	Hang. cap., lin. ft.
S.C. 296	2—9" racks	72	72	21	65
S.C. 297	2—9" racks	72	84	21	78
S.C. 396	3—9" racks	72	72	30	97
S.C. 397	3—9" racks	72	84	30	117
S.C. 497	4—9" racks	72	84	39	156

*When used in apartment buildings recommend one No. S.C. 296 or S.C. 297 with each set of laundry tubs.

Equipped with indirect gas heating system. Gas burners are contained in an interior drum which extends full length of dryer. Vent pipe measures 5 in. in diameter and is brought out at top at rear end unless otherwise specified.

**Chicago-Interior Gas Heated Compartment Dryer**

Built in compartments containing two 9-in. racks, viz.:

Comp. No.	Contains	Height, in.	Length, in.	Width, in.	Hang. cap., lin. ft.
2972	2—9" racks	78	72	21	65
2984	2—9" racks	78	84	21	78

Each compartment equipped with indirect individual gas heating and complete ventilating system. When used in apartment buildings, we recommend one compartment for each set of laundry tubs. Vent pipe may be brought out at top or either side close to rear end, as may be required. Each compartment may be provided with locking bar attachment, when so specified. Can be supplied with any number of compartments desired.

**Chicago-Francis Interior Gas Heated Dryer, No. 5909**

When so specified, may be equipped with Type S.C. (Self-contained) Racks.

Sizes—Built in various sizes containing 2, 3, 4, 5, 6, 7, 8 or more racks or draws, as may be specified. Each rack measures 9 in. wide and has a hanging capacity of 39 lin. ft. Vent outlet from dryer, 5 in. in diameter.

Uses and Descriptions—Adapted for use in residences, apartment buildings and institutions of all kinds. Equipped with indirect gas heating system. Gas burners are contained in an interior heat retaining galvanized sheet steel drum, thus heating the dryer with minimum gas consumption. No flame is exposed. Only pure and clean heat. Provided with one or more burners, depending on size. Each burner provided with independent shut-off valve so that the heat in the dryer can be regulated to suit conditions. Base provided with independent vent ducts so that moisture is carried away by natural air circulation; minimum loss of heat. This is a very economically operated dryer.

Note: When so specified, may be equipped with Type S.C. (Self-contained) Racks.

Chicago-Francis Dryer with Gas Laundry Stove Attached, No. 4906

Sizes—Various, containing 2, 3, 4, 5 or 6 racks or draws, as may be specified. Vent outlet from dryer, 5 in. in diameter. Stove, 22 in. square. Racks measure 9 in. wide. Hanging capacity of each rack, 39 lin. ft.

Uses and Operating Cost—Used in residences, apartment buildings, schools and institutions of all kinds. Stove may be used for boiling clothes or heating flat irons—waste heat heats drying cabinet and dries the clothes. Cost of operating stove 2 to 3½ cents per hour, figuring gas at \$1.00 per 1000 cu. ft. For residences we recommend dryers containing 3, 4 or 5 racks. Economically operated.

These dryers when built with three or more racks, may, when so specified, be provided (in lieu of gas stove) with our No. 10 stove which is designed for burning coal or wood. Our No. 10 stove occupies space of 27x30 in.

Chicago-Francis Gas Heated Cabinet Dryer

Uses and Sizes—Adapted for use in residences, apartment buildings, schools, clubs, etc. Sizes as follows:

Dryer No.	Height, in.	Width, in.	Depth, in.	Hanging capacity
G-209	72	62	21	60 lin. ft.
G-309	72	80	21	85 lin. ft.
G-409	72	80	26	117 lin. ft.

Description—Gas burner is contained in an interior drum. No flame exposed. No fumes or odors can possibly come in contact with the clothes. Complete air circulating system. Moisture carried away with minimum loss of heat. Equipped with ventilated hanging bars, which prevent overheating or injury to the most delicate fabric.

When used in apartment buildings, it is customary to provide one No. G-209 or G-309 size with each set of tubs. For residences, we recommend using the No. G-309 or G-409.

May be equipped with thermostatic heat control when so specified.

Chicago-Francis Electrically Heated Cabinet Dryer

Built in various sizes as follows:

Dryer No.	Height, in.	Width, in.	Depth, in.	Hanging capacity, lin. ft.
E-209	74	62	21	60
E-309	74	80	21	85
E-409	74	80	26	117

Approximate current consumption, 3 kw.

These dryers can be supplied for steam heat, in lieu of electric heat, when so specified. When steam heated, recommend that high pressure steam be provided.

Chicago-Francis Cabinet Type Garment Dryer, No. 609

Suitable for use in golf club buildings for drying golf toggery, shoes, etc. Fire engine houses, athletic field houses, gymnasiums, baseball clubs, telephone exchanges, etc. Interior hanging arrangement may be varied to suit kind of garments, uniforms, athletic wearing apparel, boots, shoes, etc., to be dried. Standard size measures 84 in. high, 26 in. deep, 80 in. wide. Heated by means of gas, steam or electricity, as may be specified. When heated by electricity the current consumption is 4½ kw.

Chicago-Francis Electrically Heated Dryer (Rack Type) No. E49

Built in various sizes containing 2, 3, 4, 5 or 6 racks or draws, as may be specified. Each rack measures 9 in. wide and has a hanging capacity of 39 lin. ft.

Approximate current consumption, 1½ to 2½ kw. per each rack or draw, depending on requirements.

Chicago-Steam Heated Dryer, No. 8990

Built in various sizes containing 2, 3, 4, 5, 6, 7 or 8 or more racks or draws. Each rack measures 9 in. wide. Furnished either with or without heating coils as may be ordered. When we furnish heating coils, we supply 20 sq. ft. of radiation for each rack or draw.

For rapid service recommend that high pressure steam be provided.

*Chicago Electric Washer and Safety Wringer

Adapted for use in residences and small institutions.

Only machine on the market with wringer equipped with automatic conveyor for conveying clothes into rolls, and automatic safety stop which prevents tearing of clothes and insures absolute protection against possible accident to operator when wringing clothes.

Washer tub made of copper with nickeloid plating on inside. Framework is of heavy iron. Outside of washer tub, including framework, finished in white enamel. Provided with water inlet for stationary water and drain connections.

Will wash clothes thoroughly clean and without injury in 10 to 15 minutes. Equipped with $\frac{1}{4}$ hp. motor, which may be connected to any lighting circuit.

When planning, recommend washing machine being placed at either right or left end of stationary laundry tubs as shown in illustration.

Made in the following sizes:

No.	Capacity, sheets	Size wringer, in.	Washer tub measures, in.	Occupies floor space, in.
214	9	14	26x18	26x34
314	12	14	26x21	26x37
414	15	14	26x24	26x40

*Tested and approved by the Good Housekeeping Institute conducted by the "Good Housekeeping Magazine."

Floor Plan of Modern and Up-to-date Residence Laundry Room

Shows installation of Chicago laundry appliances.

SWEET'S

*Chicago Three-roll Gas Heated Ironer

Suitable for ironing all kinds of flat work, such as sheets, pillow cases, towels, table linens, etc. Adapted for use in residences, apartment buildings and small institutions.

Equipped with 3 rolls, consisting of 1 heated and 2 compression rolls. All the rolls revolve. No wear on linens.

These machines are furnished equipped with atmospheric gas burner or burner with gas blower attachment in the following sizes:

Ironer No.	Length rolls, in.	Outside dimensions, in.	Size motor, h. p.	Type of gas burner
3-50A	50	28x 75	$\frac{1}{4}$	Atmospheric
3-50B	50	28x 75	$\frac{1}{4}$	Blower att.
3-60A	60	28x 85	$\frac{1}{4}$	Atmospheric
3-60B	60	28x 85	$\frac{1}{4}$	Blower att.
3-75B	75	28x100	$\frac{1}{2}$	Blower att.

*Tested and approved by the Good Housekeeping Institute conducted by the "Good Housekeeping Magazine."
Automatic Safety Stop Finger Guard approved by New York State Labor Safety Commission.

Chicago Ironing Board and Stand with Electric Attachment, *No. 302

Ironing board measures 60 in. long by $1\frac{3}{4}$ in. thick. Large end measures 16 in. wide and tapers to 10 in. at small end. Underside of board provided with patented attachment for holding padding. Base and stand finished in white enamel. Stand is self-contained and need not be fastened to floor.

*Tested and approved by the Good Housekeeping Institute conducted by the "Good Housekeeping Magazine."

Continued on next page

Chicago-Institutional Laundry Appliances

Chicago-Institutional Laundry Appliances may be advantageously used in hotels, hospitals, clubs, cafeterias, sanitariums, including public and private institutions of all kinds.

Chicago-Laundry Equipment eliminates the necessity of providing high pressure steam. Its initial cost as well as its operating cost is less than steam operated outfits. Our engineering department is at your free disposal. Plans and estimates submitted without obligation. We invite your inquiry.

We can supply individual machines or complete outfits consisting of Direct Motor Driven Cylinder Type Washing Machines, Gas or Electrically Heated Ironing Machines, Extractors, Tumbler Dry Rooms, etc. Our largest size gas heated ironer has a capacity of approximately 2000 lb. dry weight daily. Our complete outfits are used in hundreds of institutions with 100% satisfactory results in every instance. List of installations furnished on request.

Write for Bulletin No. 33.

Chicago-Direct Motor Driven Cylinder Type Washing Machine, No. E-3136, No. E-3152 and No. E-3652

Operated by means of electric motor contained in housing. The direct unit drive attachment allows easy installation and economy in operation. Eliminates noisy and overhead line shaft. Made with wood shell and wood cylinder.

Built in sizes as follows:

Washer No.	Cylinder size, in.	Size motor, h. p.	Approximate capacity, sheets	Occupies floor space, in.
E-3136	31x36	$\frac{3}{4}$	30	46x76
E-3152	31x52	$\frac{3}{4}$	50	46x92
E-3652	36x52	1	75	54x100

Chicago-Six Roll Gas Heated Flatwork Ironer with Motor and Blower Attached

Completely Solves the Ironing Problem

For use in moderate sized hotels, hospitals, schools, clubs, sanitariums and institutions of all kinds.

Linens when run through singly may be taken *direct* from *extractor*, *dried* and *ironed* in *one pass*, at speed ranging from 10 to 20 lin. ft. per minute. Equipped with 6 rolls consisting of one hollow steel roll $10\frac{1}{2}$ in. in diameter which is heated internally by means of gas burner and 5 padded compression rolls. All the rolls revolve. No wear on linens. Compression rolls are compressed and raised from heated roll by means of *instantaneous foot control*. Equipped with ribbon feed attachment, including automatic safety stop finger guard and wire screen guard over compression rolls, approved by the New York State Labor Safety Commission.

Sizes as follows:

Ironer No.	Length of rolls, in.	Occupies floor space, in.	Size motor, h. p.	Approximate gas consumption per hour, cu. ft.
6-60	60	40x 90	$\frac{1}{2}$	75
6-80	80	40x110	$\frac{1}{2}$	100
6-100	100	40x130	$\frac{1}{2}$	125
6-120	120	40x150	$\frac{1}{2}$	150

Provide 1-in. gas supply.

Chicago-Direct Motor Driven Extractor, No. 20 in. Type M. D.

Basket measures 20 in. in diameter and is spun from extra heavy copper, tinned on inside and heavily reinforced to prevent bulging. Is supplied with safety cover interlocking device. Operated by means of $1\frac{1}{2}$ hp. motor. Occupies floor space 30x56 in.

Chicago-Six Roll Electrically Heated Ironer with Motor Attached

Made in two sizes, viz.:

Ironer No.	Length of rolls, in.	Occupies floor space, in.	Size motor, h. p.	Current consumption, k. w.
E6-75	75	40x105	$\frac{1}{2}$	16
E6-100	100	40x130	$\frac{1}{2}$	24

Descriptive folder with illustration furnished on request.

Chicago-Eleven Roll Gas Heated Flatwork Ironer with Motor and Blower Attached. No. 11-104

This machine has been designed to meet the requirements of larger sized hotels, hospitals, clubs and institutions, including commercial laundries, where capacity ironers are required. Our No. 11-104 is similar in design to our Six Roll Type. It is, however, equipped with 11 rolls consisting of one hollow steel roll, highly polished on external surface, measuring 24 in. in diameter, which is heated internally by means of 2 gas burners and 10 padded compression rolls. All the rolls revolve. No wear on linens. Rolls measure 104 in. in length.

Linens when run through singly may be taken *direct* from *extractor*—*dried* and *ironed* in *one pass* at speed ranging approximately from 10 to 40 lin. ft. per minute. Provided with ribbon feed attachment, including automatic safety stop finger guard and wire screen guard over compression rolls which has been approved by the New York State Labor Safety Commission. Capacity: approximately 2000 lb. dry weight daily.

The 10 padded compression rolls are compressed or released and raised from the heated roll by means of an *instantaneous foot control*. Our No. 11-104 measures 56 in. in width and 134 in. in length. Descriptive folder with illustrations furnished on request.

THE INTERNATIONAL NICKEL COMPANY, INC.

Monel Metal and Nickel and Allied Products

EXECUTIVE OFFICES
67 Wall Street
NEW YORK, N. Y.

MINES AND SMELTER: Copper Cliff, Ont., Canada
ROLLING MILL AND REFINERY: Huntington, W. Va.

REFINERY: Port Colborne, Ont., Canada
FOUNDRY: Bayonne, N. J.

For Our Other Products, see Manufacturers' Index

Products

MONEL METAL—available from stocks conveniently located throughout the country and made in all commercial forms required by manufacturers of laundry equipment. (See Manufacturers' Index, our section on Metals, for commercial forms and location of warehouses.) All necessary accessories such as nuts, bolts, screws, rivets, etc., are also available.

Monel Metal

Monel Metal is a registered trade-mark applied to a technically-controlled nickel-copper alloy of high nickel content. Monel Metal is mined, smelted, refined, rolled and marketed solely by International Nickel.

Advantages of Monel Metal in the Laundry

- (1) Resists corrosive action of soaps, sour, bleaches, etc. Rustproof.
- (2) Does not spot or stain the wash.
- (3) Solid, glass smooth, wear-resisting surface that cannot harm delicate fabrics.
- (4) Saves floor space.
- (5) Strong as steel, withstands abuse.
- (6) Clean, sanitary and attractive in appearance.

Uses

Washers, extractors, trucks, utensils, chutes, hoppers, table tops, starching equipment, soap tanks, identification tags, clips, etc.

Development of Modern Laundry Machinery

In 1917 the first Monel Metal washers were built. These were placed in commercial laundry service for test and observation. The service given by these and other Monel Metal washers built during this experimental period was so satisfactory that Monel Metal was adopted as a standard material of construction for washers.

The new metal washers met with the general acceptance of the laundry industry and in the last ten years more than 15,000,000 lbs. of Monel Metal have been used in commercial, industrial, institutional and hotel laundries.

In 1929 one company adopted Monel Metal as standard basket construction for extractors. The satisfactory service of Monel Metal in laundries has naturally led to its wide adoption in dry cleaning plants.

Some of the Monel Metal Washers in the Hotel New Yorker, New York, N. Y.

Transportation in the Modern Laundry

Chutes, hoppers and trucks. There is a definite trend in the modern laundry to adopt the production line principles so effective in industrial plants. Monel Metal construction has been found ideal for the various gravity hoppers and conveying chutes leading from washers on one floor to extractors below and for the trucks used to transport from washers to extractors where chutes are not used.

The same properties of Monel Metal, freedom from rust and corrosion, glass-smooth surface, strength and durability, as evidenced in washer service have been responsible for its wide specification for hoppers, chutes and trucks.

The names of reliable sheet metal workers skilled in building Monel Metal chutes, hoppers, and trucks will gladly be sent on request.

Monel Metal Washers and Trucks in the Laundry of the Montefiore Hospital, Pittsburgh, Pa.

Experience

Over thirty years of actual knowledge of, and experience with, the requirements in this line have caused us to create and develop the most efficient and highest type of laundry devices for the domestic service, and our many complete equipment installations in the finest homes have won for us the distinction of being specialists in this field.

Note to Architects

We solicit the privilege of assisting and co-operating in the planning and proper arrangement of laundry rooms for apartment houses, residences or institutions. Send in blue print or tracing of space to be allotted to the purpose and a general idea of the requirements, and we will return plans, specifications, illustrations and prices.

"Judelson" Dryer with (Patented) Indirect Interior Gas Radiator

Floor Plan of a Typical Residence Installation

An outstanding feature of this Dryer (illustrated above) is the new "Judelson" Type of hanging rack construction which eliminates both (1) overhead traveler bars, and (2) the floor carriage rack arrangement previously in use.

This is the latest and most perfect development in rack construction, and is adaptable to conditions where doors and overhead obstructions interfere. Its appearance is a radical improvement over former types, doing away with the unsightly superstructure heretofore required.

Heated by either interior gas radiator, gas or coal stove attached, steam coils or electric elements.

The number of racks selected is determined by the volume and character of work to be done.

Standard over-all dimensions—length 7 ft., height 7 ft. 6 in. (subject to modification to suit job conditions), width determined by number of racks required.

Rack widths 9 in. (6 bars 39 lin. ft.) and 10 in. (8 bars 52 lin. ft.).

JUDELSON DRYERS—APPROVED BY AMERICAN GAS ASSOCIATION TESTING LABORATORIES

Drawer Style

This style of Judelson Dryer has been given the preference in many of America's finest homes and apartment houses. The racks slide in and out smoothly on a ball bearing arrangement and laundry may be placed on or removed from the hanging bars with the utmost ease and comfort. When racks are extended the rear panels of the drawers seal the front of the cabinet, preventing escape of heat and discomfort to user.

No. 903. Three-drawer Type

Eighteen-sheet capacity—equal to 97½ feet of clothes line. Dimensions: width, 2 ft. 7 in.; height, 6 ft. 3 in.; height, including down-draft diverter, 6 ft. 9 in.; length, 6 ft.; rack extension, 5½ ft. Floor space, 3x11½ ft. Shown with one rack extended. Note how rear panel on extended rack seals front of dryer—preventing escape of heat and discomfort to user when drawer is opened for hanging or removing clothes.

The body construction is exceedingly rigid and rests on sturdy legs raising it 3 in. from the floor. *Double wall panels with ¾-in. air insulating space between casings* are made of heavy gauge, rust-resisting Cop-R-Loy steel. The unique method of construction not only adds strength and rigidity to the cabinet but also conserves the heat in the dryer, prevents it from radiating into the laundry room and eliminates hot outer casings.

The patented Judelson Heating System is highly efficient, distributes the heat evenly throughout the drying chamber and is controlled by *automatic thermostat*. A protective screen is placed above the enclosed heating element and there is an extra screen at the bottom of each individual drawer for drying anything that cannot be readily placed on the bars. Finished attractively in French gray with light blue trim.

No. 902. Two-drawer Type

Twelve-sheet capacity—equal to 65 feet of clothes line. Dimensions: width, 1 ft. 10 in.; height, 6 ft. 3 in.; height, including down-draft diverter, 6 ft. 9 in.; length, 6 ft.; rack extension, 5½ ft. Floor space, 2 ft. 3 in. x 11½ ft.

Cabinet Style

The Judelson Cabinet Dryer embodies the most desirable features ever combined in a cabinet style dryer. The heating, ventilating and evaporating system is the same as that used in the Judelson drawer style dryer and carries the same high standards of workmanship and materials. The cabinet is made of heavy gauge Cop-R-Loy rust-resisting steel and the rigid, *air-insulated double panels* prevent radiation of heat into the laundry room and eliminate hot outside casings.

Another special feature of the Judelson Cabinet Dryer is the arrangement of baffles which prevent the escape of heat and discomfort to the user when the cabinet doors

are open for hanging or removing clothes. The baffles operate automatically with opening and closing of cabinet doors. An interior view is shown below at right.

The patented Judelson Heating System is highly efficient, distributes the heat evenly throughout the drying chamber and is controlled by *automatic thermostat*. A protective screen is placed above the baffles and enclosed heating element. The hanging bars are conveniently arranged and have a capacity in excess of the full load of a domestic washer. Finished attractively in French gray with light blue trim.

No. 602. Cabinet Type

Twelve-sheet capacity—equal to 65 feet of clothes line. Dimensions: width, 6 ft.; height, 6 ft.; depth, 2 ft. Floor space, 2 ft. 5 in. x 7½ ft.

All Judelson Dryers forwarded in knock-down form, properly crated and marked for assembling and erection. No bolts or screws required. Easily assembled by following instructions in about thirty minutes.

The Judelson Heating Element for Gas

The interior portion of the Judelson Gas Heating Element is shown at the right.

An unusually long heat travel is created in the radiating drum by means of the patented arrangement of baffling, which controls the flow of heat and breaks up the products of combustion. The construction and arrangement of the essential parts develop the highest efficiency ever obtained in a gas-heated dryer.

All products of combustion consumed within heating unit; only moist vapors passing through to flue. Adapted for city, manufactured, mixed or natural gas. In ordering, designate which is required. Maximum efficiency at minimum operating cost.

"DOMESTIC" DRYERS OF VARIOUS TYPES FOR VARIOUS PURPOSES

All our dryers are built-to-order to suit the locations for which they are intended. The number and size of racks are determined by the number of persons to be provided for and the character of work to be done. The heating system is chosen by conditions governing the jobs—if gas is available it should have preference; if not, coal stove, steam or electric heating may be employed.

All dryers are constructed of heavy angle iron framework, with casing or housing of best galvanized iron. Housing and top doubled with 1-in. air space to prevent heat radiation. Rack fronts are doubled and asbestos lined. Separate hinged access doors

to heating system. Handles and hardware of brass.

All dryers are equipped with double wire mesh screen guard, one over the heating system and one attached to bottom of each rack for drying articles that cannot be conveniently hung on bars, and to catch garments that may slip from bars while racks are in motion.

When racks are extended the rear frame seals the aperture in face of dryer cabinet, conserving temperature and preventing escape of heat. All hanging bars are specially hot galvanized and ventilated.

All features are patented.

Standard over-all dimensions of all dryers—length 7 ft., height 7 ft. 6 in. (subject to modification to suit job conditions), width determined by number of racks required.

Rack dimensions are 9 in. wide (6 hanging bars 39 lin. ft.) and 12 in. wide (8 bars 52 lin. ft.).

"Domestic" Athletic Garment Dryer—For Golf, Tennis Clubs, Squash Courts, Stadiums, Gymnasiums, etc.

A sanitary cabinet designed for the efficient drying of wearing apparel in the locker room. Eliminates the discomfort of wet clothes and their menace to health; removes body moisture from garments and insures an odorless locker room with clean smelling garments for the day's play. A vital and essential service for the comfort and convenience of members and guests.

Heated by interior gas, steam or electric units. Contains two 15-in. and two 9-in. racks (or such sizes and combinations as required). Wide racks for coats, knickers, sweaters, hose, etc. Narrow racks for underwear, towels and flatwork. Screen shelves for shoes, etc.

"Domestic" Model Type Steam Heated Dryer

For use in institutions where steam is available. Dryer is heated by steam coils within casing.

Requires steam supply and return connections—sizes governed by amount of radiation

"Judelson" Multiple Family or Apartment House (Locking) Dryer

For use in apartment houses or similar requirements. Built in sections or compartments each containing two or three racks, with angle iron uprights and galvanized iron partitions between compartments. Each compartment is numbered and secured with a cross bar and individual lock with duplicate keys. Racks are 7½ or 9 in. wide. Interior gas or steam heated.

Allow one compartment for each set of tubs, or the number of compartments may be determined by the number of families based on a 3-day service, for example—a 30-family apartment requires a 10-compartment dryer to do the work in 3 consecutive days

"Domestic" Type "U" Uniform, Garment, Blanket and Rubber Boot Dryer

Designed for use in fire houses, police stations, post offices, stables, milk depots and similar requirements.

Equipped with coat and trouser hangers, garment and blanket racks, boot holders, etc., in such combination as may best suit the purpose in hand. Cabinet is 7 ft. 6 in. long and 7 ft. 6 in. high, the width determined by the number and sizes of racks. The racks are 15, 16¼ or 18 in. wide. Heated by either steam, gas or electricity

"Domestic" Washer and Safety Wringer

A substantial and efficient motor driven washer. Made in two sizes, 20 and 25-sheet capacity; particularly adapted to large families, clubs, institutions, etc. Brass cylinder, copper body

"Domestic" Simplex Ironer

Stationary shoe and revolving padded roll, gives results of handwork on all kinds of flat work. Gas or electric heated. Made for every requirement in three sizes, 46, 48 and 56-in. roll lengths

A Comprehensive "Domestic" Laundry Plant, Designed for Institutions or Hospitals Where High Pressure Steam Is Not Available

LAUNDRY MACHINERY

Troy-equipped Laundry of Essex County Isolation Hospital, Belleville, N. J.

Troy Engineering Service

Our Engineering Service Department will assist in planning, laying out and preparing specifications for laundries of any size or type.

Care and expert attention should be employed in planning the laundry. Many factors are to be considered. Machinery installations and equipment layout vary with the work to be done, the space available, the location of doors, windows and bin space. Linens and garments should pass through the various processes without waste motion—in a direct line from one operation to another.

As an aid to architects, engineers, building committees and executives in laying out laundry facilities, Troy offers without charge the Troy Engineering Service for assisting in any phase of planning and equipping laundry plants in any size or type of project.

Troy Laundry Machinery

Feel free to consult Troy Engineering Service on any problems involving laundry plans, construction, equipment and operation. Write for complete information on Troy Machinery and Troy Service.

Troy Machinery in the Laundry of the Ambassador Hotel, Los Angeles, Cal.

Information Required

When estimating or planning laundry equipment it is necessary and advantageous to all parties concerned to supply the following information:

- (1) Type and size of institution or plant.
- (2) Nature of work to be done.
- (3) Number of square feet of floor space available for laundry.
- (4) Height of ceiling.
- (5) Size of doors, windows, or other openings to laundry.
- (6) Current characteristics of lighting system and power lines.
- (7) Ventilation facilities available.
- (8) Number and size of electric power outlets.
- (9) Number and size of electric motors.
- (10) Number and size of steam, water and waste outlets.
- (11) Size of soiled linen room.
- (12) Size of clean linen room.

Premier Washers, Motor or Belt Driven

Troy Premier Washers are built in three cylinder diameter sizes, 36, 42 and 54 in. The two smaller sizes are available with horizontally or vertically partitioned monel cylinders and either wood or monel shells. The 54-in. Premier has the "Y pocket" type of horizontal partition and is monel throughout.

Premier Washers are made in either motor or belt driven models.

Type A motor drive consists of (a) direct geared reversing motor, mounted on channel supports; (b) a combined inching switch and mechanical brake in conjunction with gear lock; (c) a timer station and re-

versing control, arranged for wall or panel mounting; and (d) a safety switch on shell doors.

Type B motor drive consists of a one-way motor belted to countershaft by Graton & Knight chain belt, with starting switch or rheostat in steel cabinet.

Belt drive with elevated header consists of a positive reversing mechanism, arranged for wide belts and furnished with handle for starting and stopping machine.

Titan Washers, Wood Cylinder, Motor or Belt Driven

This new Troy Washer, the Titan, is built to handle large volume at low cost for operating and maintenance expenses. Its cylinder diameter is 44 in. and may be had in lengths up to 120 in.

The cylinder is made of close-figured, long-leaf yellow pine. Perforations are staggered for cross-sectional strength. Cylinder hoops, shell trim, ribs and

Titan Washer, 44x84 In., Wood Cylinder, Wood Shell with Monel Trim, Type A Motor Drive

pullman partitions are made of strong brass or monel metal, whichever the purchaser prefers.

The frame of the Titan—made of iron cast in one piece—supports the shell and cylinder independently, assuring full absorption of driving strength. Every advanced safety feature is incorporated to make operation absolutely danger-free.

Titan Washers may be had in either Type A motor drive or belt drive-elevated header models.

*Width of belt driven-elevated header washers is 67 in.; height is 73 in. †Shipping weight on belt driven-elevated header washers averages 300 to 500 lbs. less than on Type A motor driven washers.

Marathon Extractors, Motor or Belt Driven

The Marathon Extractor is designed to handle large size loads with an economy of space and power consumption. Its speed, smooth running, easy starting and stopping assure savings in operation. Its rigid construction—shell and curb of heavy cast iron; basket of hand hammered, corrosion-defying copper, reinforced by steel bands—guarantees long service under stress and

strain. Perfect balance, improved lubrication make operation and maintenance simple.

Vertical motor, mounted on cast iron base with adjustable platform for tightening belt and equipped with push button starter and control for wall mounting, is standard motor drive for Marathons. Horizontal motor if desired.

When belt driven, the Marathon Extractor is equipped with angle or straight type countershaft attached, consisting of tight and loose pulleys with friction pulley, mounted in a cast iron frame bolted to the curb. The countershaft is so arranged that the extractor can be set either facing the same direction as the washers when driven off the same lineshaft, or at end of a row of washers, or between a row of washers. The Marathon is also available with a detached countershaft.

Mercury Clear Top Extractor, Motor Drive

The Mercury Extractor is a highly perfected self-balancing, time controlled and automatically operated clear top extractor of large capacity. Its design is a complete departure from that commonly used in clear top machines in that all exterior parts of the extractor,

**Mercury Clear Top
Extractor, Motor Drive,
48-in. Size**

including the entire curb and motor, are all stationary, the basket being of the self-balancing type, free to oscillate independently of curb and motor mounting. This insures vibrationless operation with the resultant freedom from shocks, strains and jars which weaken floor bolts and transmit stress to foundations.

All of these bearings are provided with alenite lubrication.

Easily accessible brake, safety cover and automatic timing control are additional Mercury features which make for fast, efficient, trouble-free extraction.

Premier Drying Tumblers, Motor or Belt Driven

The Premier Drying Tumbler, utilizing the most modern, nature-like drying principle, constant up-draft suction of great volumes of fresh air at low temperature, leads in drying capacity and cleanliness of operation.

High speed, high volume fans, with fan inlet ducts at the top of the tumbler, assure perfect circulation of air through wide-mesh wire cylinder. Steam coil is at bottom of machine, correctly placed. Steady up-draft suction and absence of blast-drying eliminate lint trouble, as all lint is blown away from machine through outlet piped to outside of building.

Premier Tumblers are motor or belt driven. 120-in. models are available in Type A motor drive or belt drive with elevated header only.

All other models may be had in Type A, Type B motor drives and belt drive.

For special installations all models other than 120-in. size can be had with belt driven cylinder—motor driven fan, or with countershaft drive.

Troy "Big Six" Flatwork Ironers

This flatwork ironer is a chest type machine, having six steam chests and six padded rolls, with the necessary canvas aprons for conveying the goods being ironed, from chest No. 6 to the front side of the machine and back to the delivery table. Fully equipped with controlling and safety devices, Troy Flatwork Ironers provide an economical, efficient machine for turning out large quantities of smooth-finished flatwork.

The driving mechanism of this machine is what is known as the *motor belt drive*. This drive consists of a motor located at the rear of the ironer, then belted direct to the pulley on the drive shaft of the ironer. A suitable drum controller or rheostat is provided, this device enabling the user to change or vary the speed of the machine according to the class of work being ironed, without the use of countershaft or any variable speed device not directly connected with the machine.

Troy "Big Six" Ironers are made in the 110 and 120-in. widths only. The Troy "Big Four" Flatwork Ironer, made in 100, 110 and 120-in. widths, each having four steam chests and four padded rolls, is constructed in accordance with the general specifications of the "Big Six."

For heavier work there is the Troy "Big Eight" Flatwork Ironer constructed on the same plan as the "Big Six" Ironer but with eight steam chests and eight padded rolls. The "Big Eight" Ironer is made in the 120-in. width only.

Troy Standard Two-roll Ironers (Motor or Belt Driven)

This machine is a chest type ironer, having two steam chests and two padded rolls and using the same major parts and general construction as is used in the Troy "Big Four," "Big Six," and "Big Eight" Roll Flatwork Ironers. The principal difference is that the Two-roll Ironer utilizes a set of return ribbons which hold the goods being ironed against the bottom of the chest, and deposit them on a table directly below the feed. This eliminates the necessity of maintaining operators on the side of the machine opposite the feed. This feature of same-side feed and delivery provides an ironer of exceptional capacity for the floor space required and cuts labor costs practically in half.

The drive of this machine consists of a variable speed motor directly geared to the main drive shaft.

A suitable rheostat or speed changing controller is provided for changing the speed of the ironer according to the thickness of work being put through. Just above the ribbon feed device is hung a safety stop plate so arranged that the operator's fingers cannot pass between it and the ribbon feed, and a very slight touch of the fingers moving the plate will disengage the power mechanism and bring the machine to an instantaneous stop.

This ironer is also made in belt driven types.

LONG ISLAND CITY, N. Y.

Product and Service

HILL "INDESTRUCTO" LAUNDRY DRYERS of all descriptions for the residence, club, apartment and institution.

We have on hand drawings and statistics covering the development of laundry equipment for the past thirty years, and are glad always to place these at the disposal of architects, builders and owners in the form of advice on plans and specifications, which will undoubtedly result in great saving and efficiency.

System of Heating and Ventilating in "Indestructo" Gas Radiator

Arrows indicate moisture, vapor and fumes being drawn out of the dryer through the ventilating duct

"Indestructo" Laundry Dryer Provides Positive Ventilation

The "Indestructo" laundry dryer we believe is the only indoor dryer in which thorough ventilation is actually accomplished while the clothes are being dried.

Our sanitary radiator, which is an *exclusive* feature, distributes the heat equally through the cabinet on a *minimum* of gas consumption.

Rapid drying can be accomplished only through perfect ventilation—and our dryer has the only system which does this without requiring a flue.

Dampness is removed from the bottom of the dryer, thus facilitating heating and insuring pure white clothes

at a great saving in gas. If this dampness is not removed it requires additional gas heat to overcome it.

Construction Features

The individual drying compartment of our apartment house dryers having 10 hanging bars, each 6½ ft. long, has a linear equivalent of 66 ft. of hanging space. In a residence type of dryer, each rack has 6 hanging bars totaling 39 linear feet.

Hanging bars are spaced about 5 in. apart thus allowing *adequate circulation* for drying and are ventilated and rustproof. "Indestructo" dryers are built en-

"Indestructo" Apartment Dryer

This dryer has 18 racks or 9 compartments. Dryers of this type can be made up with an indefinite number of units depending on requirements

tirely of heavily galvanized sheet iron and angle iron.

Gas cocks are on outside of dryer protected by a guide bar and are always visible to the laundress. The operators, and owners of apartment buildings, note the great saving in floor space required and in gas consumption.

The travelling bar system is supported by truss rods through the roof of the dryer, thereby eliminating the necessity of supporting these bars from the ceiling of the room.

Built in Any Size

Hill "Indestructo" dryers are always built to order in any size, and are especially constructed for each individual building thus meeting special requirements.

Guarantee

Hill "Indestructo" dryers are guaranteed, in writing, for five years against mechanical defects.

HASLETT CHUTE AND CONVEYOR CO.

Aluminum Laundry Chutes; Waste and Rubbish Chutes

FACTORY AND ENGINEERING DEPARTMENT

OAKS, PA.

For Branch Offices, see our Conveyor Page
For our page on Conveyors, Spiral Chutes, etc., see Manufacturers' Index

Engineering and Architectural Co-operation

Architects and engineers are invited to call for the service of our Engineering Department at any time.
Qualified engineers with wide experience that covers hos-

pital, hotel, and residential work will be assigned to your inquiries. Architects and engineers have availed themselves of this service to their own advantage.

Haslett Aluminum Soiled Linen Chutes

Tube—Furnished in three standard diameters, 18, 20 and 24-in. Built of 16 B.&S. gauge aluminum plate, rolled to Haslett standards for linen chute construction. Vertical seam lock joined, horizontal seams slip joined, all seams leakproof.

Intake Throats—16 B.&S. gauge aluminum plate welded to tube forming an integral part of chute. Throats to have sloping bottoms.

Tube Cap—Flat aluminum plate with collar for 3-in. standard vent welded to center.

Supports—Outlet supported by structural steel pedestal from foundation. Tube supported and stayed by ring and angle frame at each floor.

Flushing Ring—1-in. brass pipe flushing ring provided with 1½-in. tee for water connection.

Intake Doors—Solid cast aluminum intake doors, buffed and polished, located approximately 4 ft. above each floor. Doors furnished in three standard diameters, 18, 20 and 24-in., provided with soft rubber cushions closing against polished cast aluminum frames set flush with partition wall. Doors equipped with nickel plated self-latching levers.

Outlet—90° elbow same diameter as chute, 16 B&S gauge aluminum plate welded into single unit, encased in 14 gauge steel, equipped with standard 2-in. cast iron flange for drainage connection. Sand finished cast aluminum door, with rubber cushion and self-latching lever, same type as intake doors.

Vents Not Included—Vent-flushing and drain connections. Foundations and openings through floors. Enclosing walls not to be constructed until chute is erected.

Haslett Rubbish Chutes

Stack—Standard stack constructed of 14-gauge steel, all seams flanged out and securely bolted. Standard sizes, 22, 28, 34 and 46 in. square. Sizes may be varied to meet conditions.

Cap—14-gauge steel cap provided for stack, with collar for 3-in. vent welded at center.

Interlocking Door Intakes—Located on each floor. Hoppers and doors, 14-gauge steel, welded construction. Intakes have two doors, one through which rubbish is placed in hopper and other opening into stack. Doors connected to operating handle by interrupted cut tooth gears and cams, so that one door is securely locked in closed position while other opens and closes.

Outlet—90° elbow, 12-gauge steel sides and ¼-in. plate bottom. 12-gauge steel hinged door with heavy double latch. Elbow and door strongly reinforced with angles.

Supports—Elbow supported by structural steel pedestal from foundation. Stack carried and stayed at each floor by angles across floor opening.

Painting—One shop coat gray lead and oil paint.

Work Not Included—Vent and field painting. Foundations and openings through floors. Enclosing walls not to be constructed until chute is erected.

Products

GLASS LINED STEEL LAUNDRY CHUTES for hospitals, hotels, apartments, clubs, residences.

GLASS LINED OR PLAIN STEEL DUST OR RUBBISH CHUTES.

GLASS LINED STEEL WATER COOLING TANKS.

GLASS LINED STEEL EQUIPMENT for the dairy, chemical, food processing, and beverage industries.

Schedule of Chute Prices Reduced

As the result of an entirely new method of fabrication and without sacrifice to quality, the new Pfaudler glass lined laundry chute is offered at greatly reduced prices. Consequently, the most sanitary and direct method of disposing of soiled laundry can now be incorporated into the plans of hotels, hospitals and similar buildings at a very reasonable figure.

Improved Pfaudler Glass Lined Steel Laundry Chute

The Pfaudler laundry chute will meet every condition exacted in the disposal of soiled linen in the most sanitary, permanent and economical manner. Basic materials are open hearth steel, $\frac{1}{8}$ in. in thickness, on to which is fused a genuine glass enamel. This provides a degree of rigidity and sanitation which is unsurpassed by any other chute. Steel is used in preference to light-gauge pliable metals because it is essential to its durability.

The combination of steel and glass also makes the Pfaudler chute corrosion proof and fireproof, and hence the need of ever repairing it is at once eliminated.

Construction Data—A Pfaudler glass lined chute is made of $\frac{1}{8}$ -in. open hearth steel in sections not exceeding 6 ft. long. It is made in two standard diameters: 18 in. inside, 20 $\frac{1}{2}$ in. outside; 24 in. inside, 26 $\frac{1}{2}$ in. outside (including flanges).

Note: Please state dimensions from center of chute to face of finished wall as chute is installed just before floors and walls are finished.

Chute sections are properly flanged and punched. Pfaudlerite gaskets are provided for joints to make chute watertight. Glass lining extends well beyond inner edges of gaskets and to outer edges of door throats and facings. Top section is furnished with special spray nozzle for cleaning inside of chute. The top section of chute is provided with 3-in. coupling for ventilator pipe. No other fittings furnished for this section.

A gray lacquered finish aluminum door with flat aluminum handle, rubber cushion and secured by cam-type combination clamp and handle, is located at each floor approximately 47 in. above the floor level. Throat to which door is attached is integral with chute proper, approximately 20 in. inside diameter, and of sufficient length to bring its outer edge flush with face of finished wall.

Bottom of chute is an elbow, closed watertight with cast aluminum door. This door is secured by three cam-type combination clamp and handles, and is provided with supporting hinges.

Chute has 2-in. standard pipe outlet threaded for drain connection (no other fittings furnished).

Chute is supported by one 2-in. standard steel pipe leg with cast iron base, and by $\frac{3}{8}$ -in. tie rod on each floor connected to angle irons set in steel work of floor construction.

Note: Floor openings and plumbing connections to be provided by owner.

(2) Tie rods.

Note: Floor openings and plumbing connections to be provided by owner.

Complete details covering Pfaudler chutes are contained in Bulletin No. 717.

Diagram C—Slanting door throat which may be had as an alternative. Inside diameter 18 and 24 in.; G, 17 $\frac{3}{8}$ and 21 $\frac{3}{8}$ in., respectively.

Steel Dust and Rubbish Chutes

A glass-lined or plain steel dust or garbage chute is also manufactured and is constructed along the same principles as the laundry chute. Details will be furnished on request.

Glass Lined Water Cooling Tanks and Containers

In instances where hotels, hospitals and other public buildings must have a balance tank for their drinking water system, a glass lined water cooling tank is manufactured which is ideally suited for this purpose. Among recent installations are the following: Federal Reserve Bank, Richmond, Va.; Maryland Casualty Building, Baltimore, Md.; Bulletin Building, Philadelphia, Pa.; Hotel Statler, Buffalo, N. Y.; Everett Building, New York, N. Y.

Complete data on this unit as well as on our general line of glass lined steel equipment will be sent at your request.

Complete Details Furnished on Request

METAL GLASS LAUNDRY CHUTES; WELDED ALUMINUM LAUNDRY CHUTES; WELDED ARMCO IRON LAUNDRY AND WASTE CHUTES; METAL GLASS RESIDENCE LAUNDRY CHUTES; LOCKSEAM METAL LAUNDRY CHUTES; LOCKSEAM METAL RUBBISH CHUTES; STANDARD CHUTE DOORS.

Service

Our Engineering Department will be glad to aid architects in the solution of any problems concerning the planning of laundry or waste chute installations.

Metal Glass Laundry Chute

Description—The Metal Glass Chute is a clean, glistening enameled tube built of armco ingot iron and glass enameled, both *inside* and *outside*. Not a rivet is used in its construction.

Welded Armco Iron Laundry and Waste (Rubbish) Chutes

For either laundry or waste disposal, are identical in construction to the Metal Glass Chutes with the one exception that they are painted instead of being enameled. The cost is proportionately less.

Welded Aluminum Laundry and Waste Chutes

Identical in construction to the Metal Glass Chutes except that the chute is made of $\frac{1}{8}$ -in. sheet aluminum. (See specifications.)

Metal Glass Residence Laundry Chutes

Description—The Metal Glass Residence Chute is made of the same material and constructed in the same manner as the standard Metal Glass Chutes described above, except that it is not provided with vent and drain connection and flushing ring.

Dimensions—In the domestic type laundry chute we have standardized on the 12-in. inside diameter cylindrical type, but they can also be furnished rectangular, 10x12 in. or square 12x12 in.

Moderate Cost—With polished doors, the chute is highly ornamental, as well as extremely sanitary, but can be installed at a surprisingly low cost. Its installation on the average two-story dwelling runs about \$150.00. (See specifications.)

(A) METAL GLASS LAUNDRY CHUTE—SPECIFICATIONS

Note: This same specification applies to Welded Armco Iron Chutes except that in (A1) (A2) Glass Enameled is omitted and chute is painted one coat of metallic paint inside and out.

(A1) **General**—Furnish and install where indicated on plans one (1) (specify number) Standard Metal Glass Laundry Chute(s) 12, 18, 20 or 24-in. (state which) [12 in.] [18 in.] [20 in.] [24 in.] inside diameter as manufactured by the METAL-VITRIX COMPANY, Chicago.

(A2) **Materials and Construction**—The entire area of chute, both *inside* and *outside*, shall be surfaced with Glass Enamel fused into the metal. Chute shall be made of 18 gauge Armco Ingot Iron with all seams welded and ground perfectly smooth before enameling. *No rivets shall be employed.* Chutes shall be made in suitable sections to meet building requirements. Sections shall be flanged at the ends and joined together securely with galvanized bolts. Provide flat rubber gasket between all joints.

(A3) **Door Throats**—The throat sections to which service doors are attached shall be welded to and form an integral part of the chute proper. They shall be of lengths required on plans to bring the door frames flush against the finished wall. Each throat shall be made with a groove in the bottom side sloping downward in the direction of travel to insure prompt drainage when the chute is flushed.

Note: Throats are 20-in. diameter on 24-in. size, 18-in. diameter on 20-in. and 18-in. sizes, and 12-in. diameter on 12-in. size.

(A4) **Service Doors**—At each floor to be served, provide one solid, polished, Cast Aluminum Door and Frame, the cen-

Lockseam Laundry Chutes

Description—These tubes, for use as linen chutes in institutions, hotels, hospitals, etc., are made of aluminum, ascaloy, monel, copper, galvanized steel, etc. Vertical joints are lockseamed. Horizontal joints are lap-seamed with a shoulder on inside of outer sheet and soldered lugs on outside of inner sheet. When galvanized steel is used, all raw edges on inside are covered with tin or solder.

All steel work not galvanized is painted with one coat before leaving factory. (See specifications and third page following for drawings.)

Lockseam Rubbish Chutes

These tubes, for waste and paper chutes in buildings of any type, are made square in four different sizes (see specifications) of No. 14 U. S. gauge steel, galvanized or blue annealed. All seams, horizontal and vertical, are flanged and bolted together. The intake hopper is made with two doors. When the outer door is opened the inner door automatically closes. When the outer door is closed, the inner door opens to allow the rubbish to enter the chute. All steel work not galvanized is painted one coat before leaving the factory.

Sprinkler Jet

As a standard accessory to the Lockseam Rubbish Chute and to *all* laundry chutes, there is offered a connection for a fusible sprinkler jet placed in an offset in the chute. As many jet connections as may be desired can be placed at different locations. (See drawings on fourth page following.)

Standard Chute Doors

These standard service doors are furnished as standard equipment on *all* laundry chutes and on Welded Armco Iron Waste Chutes. They not only are furnished by us as a regular part of our chute installations, but are available for application to chutes other than our own.

Description—Door assembly consists of backer ring, in two parts, flat rubber gasket, door frame, door proper, round rubber door gasket and sufficient brass nickelplated screws. They are made of solid, polished cast aluminum. They are hinged at one side and each fitted with nickelplated lever latch which catches and holds the door when it swings closed and starts it opening when released. Right-hand swing door has hinge on right side. Left-hand swing, on left.

ter of which shall be 47 in. above the finished floor line. Each door and frame shall be cast with hinge lugs and fitted with one $\frac{3}{8}$ in. brass nickelplated hinge rod. The door frames shall be securely fastened to throat flanges by brass nickelplated screws and aluminum backer rings. Each door shall be furnished with quick acting refrigerator latch and with round rubber cushion gasket. All doors shall be water and smoke tight.

Note: Doors are 20-in. diameter on 24-in. chute, 18-in. diameter on 20-in. and 18-in. chutes and 12-in. diameter on 12-in. chute.

(A5) **Outlet**—**Note:** Select type desired.

(A5a) The bottom of chute shall terminate in a 90° elbow of same diameter as the chute proper, center of which shall be 47 in. above the finished floor line. It shall be fitted with a heavy cast aluminum door, attached to chute in the same manner as service doors. The door shall be provided with a round rubber cushion gasket and shall seal watertight when closed. In the elbow there shall be a standard 2-in. iron pipe connection with strainer, for connecting drain pipe to sewer.

(A5b) The bottom of the chute shall terminate in a 45° elbow of same diameter as the chute proper, without a door.

(A5c) The bottom of the chute shall terminate in a straight run . . . inches below basement ceiling, without a door.

(A5d) Furnish outlet with an automatic fire door.

Note: Adapted to (A5c) only.

(A6) **Top**—Approximately 24 in. above top floor service door provide enameled disc top with 3-in. standard iron pipe connection in center for vent pipe. Top shall be bolted to flange of chute section and provided with a flat rubber gasket.

(A) METAL GLASS LAUNDRY CHUTE—Specifications (Continued)

(A7) **Flushing Ring**—A perforated $\frac{3}{4}$ -in. brass flushing ring shall be installed above the top throat section near the top of chute. Flushing ring shall have standard $\frac{3}{4}$ -in. iron pipe connection for water supply line.

(A8) **Supports**—Chute shall be supported by two angle irons and four tie rods at each floor (and by pipe legs with cast iron bases at the outlet elbow).

(B) WELDED ALUMINUM LAUNDRY CHUTE—SPECIFICATIONS

Note: The specification (A) Metal Glass Laundry Chute applies to Welded Aluminum Laundry Chute in all details and construction, except as follows:

(C) METAL GLASS RESIDENCE LAUNDRY CHUTE SPECIFICATIONS

Note: The specification (A) Metal Glass Laundry Chutes in general applies to Residence Chutes, except as follows:

(A) **Sizes**—Sizes are 12-in. diameter cylindrical only, or 10x12-in. rectangular or 12x12-in. square as selected and specified.

(D) LOCKSEAM METAL LAUNDRY CHUTE—SPECIFICATIONS

(D1) **General**—Furnish and install where indicated on plans one (1) (specify number) Lockseam Metal Laundry Chute(s) as manufactured by the METAL-VITRIX COMPANY, Chicago, Ill.

(D2) **Materials and Construction**—Tube shall be [12] [18] [20] or [24] in. (state which) made of (state metal desired [aluminum] [galvanized iron] etc.). Vertical joints shall be lockseamed.

Note: Top end of each section shall be flanged. At lower end an angle ring shall be riveted on approximately 1 in. from the end. The joint shall be made by bolting the flange and the angle ring together.

Sections shall telescope in direction of travel.

(D2a) All raw edges on inside shall be covered with tin or solder.

Note: Include clause (D2a) only where "galvanized iron" is specified in (D2).

(D3) **Door Throats**—At a point, approximately 47 in. above each floor, shall be installed a door throat. The throat shall be made of a 10° incline. Aluminum throats shall be welded to the chute, galvanized iron and other metals, riveted.

Note: Throats are 20-in. diameter on 24-in. chute, 18-in. diameter on 20 and 18-in. chutes, and 12-in. diameter on 12-in. chute.

(4) **Service Doors**—At each floor to be served, provide one solid, polished, cast aluminum door and frame. Each door and frame shall be cast with hinge lugs and fitted with one $\frac{3}{8}$ -in. brass nickelplated hinge rod. The door frames shall be securely fastened to throat flanges by brass nickelplated screws and aluminum backer rings. Each door shall be furnished with quick acting refrigerator latch and with round rubber cushion gasket. All doors shall be water and smoke tight.

Note: Doors are 20-in. diameter on 24-in. chute, 18-in.

(E) LOCKSEAM METAL RUBBISH CHUTE—SPECIFICATIONS

(E1) **General**—Furnish and install where indicated on plans one (1) (specify number) Lockseam Metal Waste Chute(s) as manufactured by the METAL-VITRIX COMPANY, Chicago, Ill.

(E2) **Materials and Construction**—The tube shall be constructed of No. 14 U. S. gauge steel (galvanized, or blue annealed—state which), 13x13 in., 22x22 in., 28x28 in., 31x31 in. square (state which). All seams horizontal and vertical shall be flanged and bolted together.

Note: Waste chutes also made cylindrical, 12, 18, 20, 24 or 30-in. diameter.

Note: Add (4 in.) to the tube size for size of opening in floors.

(E3) **Inlets**—(Patents pending.) At a convenient point above each floor there shall be provided an inlet hopper made of No. 14 U. S. gauge steel equipped with an inner and outer door. Opening of hopper shall be 2 in. less than size of tube hopper. Hopper doors shall be so arranged that one door will always be closed when the other door is open. The lug holding the inner door closed shall be provided with an adjusting screw to maintain the proper tension.

(E4) **Outlet**—At a point approximately 4 ft. above the delivery floor the chute shall terminate in an elbow boot made

(A9) **Piping**—All piping to and from chute (including vent pipe and ventilator) shall be furnished and installed by others.

(A10) **Sprinkler Jets**—Provide one (1) (specify number and location) standard 1-in. size automatic sprinkler jet(s) set in (an) offset recess accessible from the inlet door.

(A) **Material**—Chute shall be made of $\frac{1}{8}$ -in. aluminum (bottom elbow $\frac{1}{4}$ in.).

(B) **Outlets**—Same as (A5a) or (A5c) with or without fire door as in (A5d). Drain fitting omitted in Outlet E.

(C) **Top**—Same as (A6) with the exception that ventilator outlet is customarily omitted. This can be furnished where specified.

diameter on 20 and 18-in. chutes, and 12-in. diameter on 12-in. chute.

(D5) **Outlet**—Chute shall terminate in a 90° elbow set approximately 4 ft. above delivery floor. Terminating elbow shall be provided with a drain and strainer having 2-in. diameter cast iron screw flange, or the bottom of the chute shall terminate in a 45° elbow of same diameter as the chute proper, without a door.

Note: The following are alternate items for the outlet:

(1) Outlet to be furnished with automatic fire door.

(2) Outlet to terminate in 45° elbow.

(3) Outlet to terminate in straight run ... inches below basement ceiling.

(D6) **Top**—Top cover of chute shall be of the same metal as the tube set approximately 18 in. above center of top service door and provided with a 3-in. diameter cast iron screw flange for vent.

(D7) **Flushing Ring**—The flushing ring shall be of $\frac{3}{4}$ -in. brass pipe equipped with a $\frac{3}{4}$ -in. galvanized iron pipe connection for water supply line.

(D8) **Supports**—At each floor the chute shall be supported by a steel angle ring clamped to the tube below lugs, and resting on the floor slab. At the outlet elbow a structural steel cradle support shall be provided from the floor to the elbow.

(D9) **Painting**—All steel work not galvanized shall be given one coat of good lead and oil paint before leaving factory.

(D10) **Piping**—All piping to and from chute (including vent pipe and ventilator) shall be furnished and installed by others.

(D11) **Sprinkler Jets**—Provide (1) (specify number and location) standard 1-in. size sprinkler jet(s) set in (an) offset recess accessible from the inlet door.

of No. 12 U. S. S. gauge steel with a heavy hinged door provided with a substantial latch.

Note: The following are alternate items for the outlet:

(1) Outlet to be furnished with automatic fire door.

(2) Outlet to terminate in 45° elbow.

(3) Outlet to terminate in straight run ... inches below basement ceiling.

(E5) **Top**—The top of chute shall be a cover made of No. 14 U. S. S. gauge steel. This top shall be fitted with a 3-in. diameter cast iron screw flange for vent.

(E6) **Supports**—At each floor the chute shall be supported by two angles, bolted to the flanges. The end of these angles shall be supported to the floor. The bottom of the chute shall be supported by a structural steel cradle resting on floor.

(E7) **Sprinkler Jets**—Provide one (1) (specify number and location) standard 1-in. size automatic sprinkler jet(s) set in (an) offset recess accessible from the inlet door.

(E8) **Painting**—All steel work not galvanized shall be painted one coat before leaving factory.

(E9) **Piping**—All piping to and from chute (including vent pipe and ventilator) shall be furnished and installed by others.

Notice to Architects

(1) Provide opening in floor 4 in. larger than size of chute.

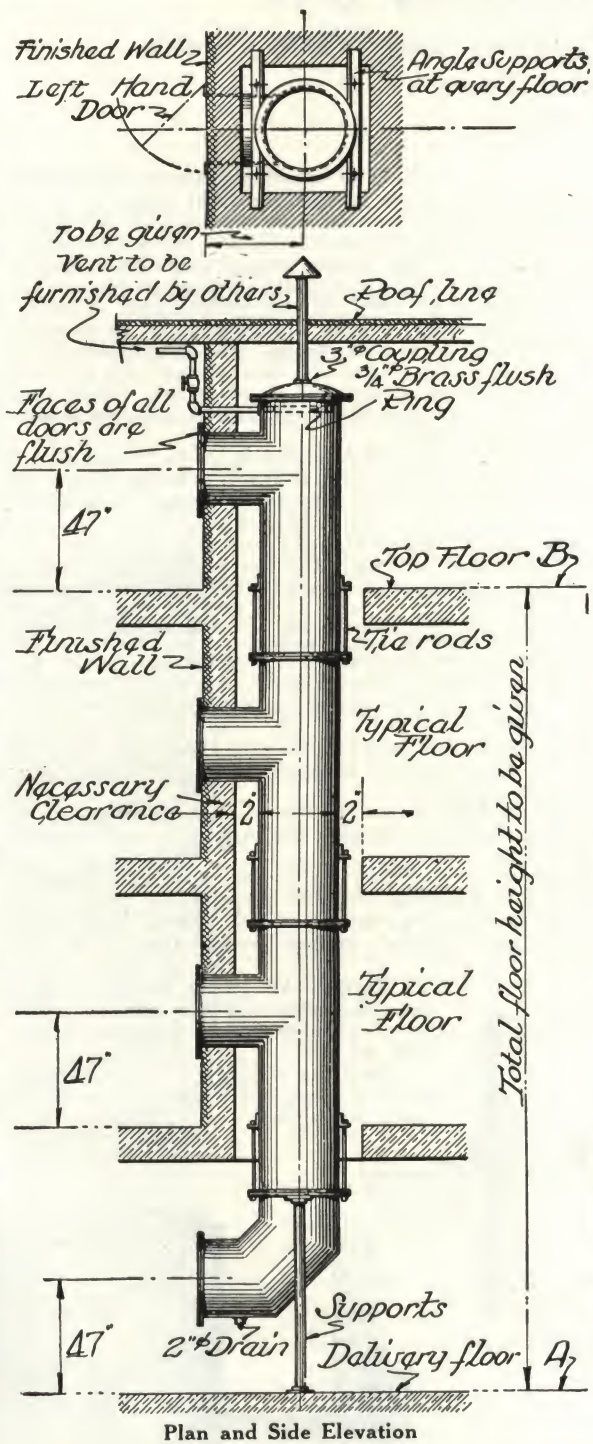

(2) Provide for 3-in. vent through roof and for 2-in.

drain pipe at bottom. Ventilator and all piping to be furnished and installed by others.

(3) Chute must be installed before partition walls are set up.

LOCKSEAM LINEN WASTE CHUTES

METAL GLASS LAUNDRY CHUTE

TUBULAR CHUTE SYSTEMS, INC.

Manufacturers of "Indestructible" Laundry and Waste Chutes

1569, 20 North Wacker Drive
CHICAGO, ILLINOIS

Products

COPPER LAUNDRY and WASTE CHUTES (Tinned or Plain).

Chutes made of Aluminum, Ascoloy, Galvanized Iron and other metals.

Copper Laundry and Waste Chutes

"Indestructible" non-corrosive metal chutes possess all the advantages of more expensive equipment in this field while avoiding disadvantages and dangers. They have been designed to meet the growing insistence on the part of architects and builders for equipment that is positively non-corrosive in itself, sturdy, sanitary and moderately priced. The chutes are rugged and strongly anchored in place. The interior of the tube is perfectly smooth and will permanently remain so. The doors are of polished aluminum and highly ornamental. Each chute is provided with a brass spiral flushing device, with connection at top for vent pipe and at bottom for drain pipe. In addition, provision is made in our construction for inserting an automatic sprinkler jet above the outlet, at slight additional cost.

Standard "Indestructible" copper chute specifications following, apply exactly to standard chutes made of aluminum, ascoloy and galvanized iron with the exceptions only that in our standard equipment we use $\frac{1}{8}$ -in. aluminum and ascoloy and No. 18 U.S.S. gauge galvanized iron.

We are equipped to manufacture chutes of heavier or lighter weights than above standards, if desired, and to meet any special construction requirements.

Standard Specifications

Tube—Shall be 18 in. [24 in.] inside diameter, made of 24-oz. cold rolled copper, tinned over entire inner surface [plain], and constructed in sections of required lengths. All vertical joints shall be lock seamed. All horizontal joints shall be lapped and riveted to angle iron braces so that at no point in chute proper will two sheets of thin metal be joined together. Only copper rivets shall be used, all countersunk and ground smooth. All riveting shall be done at the factory. Sections shall be

telescoped in the direction of travel and adjacent angle irons bolted together to assure smooth and tight joints.

Intakes—Center of intake door throats shall be approximately 45 in. above the finished floor line. All throats shall be 18 in. in diameter. The bottom side of each throat shall descend at an angle of 30° to facilitate quick evacuation of linen. Where the throat is joined to the chute proper it shall be lapped, riveted, ground smooth and soldered, so as to make a perfectly smooth joint on the inside. The door assembly shall consist of backer ring, frame and door proper, each part made of aluminum. Intake doors shall be of artistic design, highly polished and watertight, hinged and fitted with quick acting refrigerator type latch.

Outlets—The chute shall terminate at the bottom in a 90° elbow (see note) fitted with a heavy polished water tight aluminum door, center of which shall be approximately 48 in. above the finished floor. This elbow shall rest in a steel cradle designed to give ample reinforcement against impact. The cradle in turn shall be supported from the floor by a steel leg. A 2-in. drain pipe connection with strainer is to be provided in the outlet elbow.

Note: The Chute may be terminated at bottom in a 45° elbow or in a direct run without elbow, with or without automatic fire door.

Automatic Jet Sprinkler—(Furnished only when specified). In an accessible offset in chute, opposite and slightly below the first intake door install one 1-in. fusible sprinkler jet through chute.

Top—Above the top intake provide a flat top of the same material as the chute, provided with 3-in. pipe connection for vent pipe, in center.

Flushing Ring—Near the top of chute install a 1-in. circular perforated brass flushing ring with 1-in. pipe connection for water line.

Supports—In addition to cradle and leg support at bottom elbow the chute shall be supported at each floor by two steel lugs resting on the floors. These lugs shall be welded to steel bands, clamped firmly around the chute proper.

Piping—All piping to and from the chute, including vent pipe, shall be provided by others. Connections only are furnished with the chute.

Painting—All steel not galvanized shall be painted one coat before shipment from the factory.

Outlet Elbow and Door

Method of Joining Sections

Intake Door Throat Section

C. M. WILKINSON COMPANY

Citizens Building
CLEVELAND, OHIO

Products

WILKINSON SOILED LINEN CHUTES, WILKINSON RUBBISH CHUTES and WILKINSON WASTE TOWEL CHUTES, for hospitals, hotels, apartment hotels, schools, dormitories, institutions, office buildings, industrial establishments, residences, etc.

Exclusive Advantages of Wilkinson Chutes

Wilkinson Chutes are better chutes. Scientifically designed as the result of 20 years' experience in chute engineering, every Wilkinson Chute embodies many exclusive features which give it decided advantages. Among their outstanding improvements are these:

No gaskets—nothing to wear out or deteriorate.

No rivets to rust or mar their smooth interior surface. Inside projections of every kind are eliminated.

Every horizontal joint is an expansion joint. Each chute length is fitted into the one below with inside lap assuring "give and take" to allow for expansion or contraction. Wilkinson Chutes cannot crack wall enclosures.

Each story height of chute is individually supported at its respective floor.

Foot operated intakes—Wilkinson Intakes are the outstanding development in chute design.

Hopper type, self-closing, aluminum doors, flush with walls—no projections.

Sloping intake extensions—of aluminum.

Patented slanting impact plate—to prevent puncturing or damaging the bottom of chute or discharge door.

Counterbalanced, top-hinged discharge door.

Wilkinson Soiled Linen Chute

This chute cannot wear out or lose its value. There is nothing to get out of order, nothing to replace, nothing to repair.

Wilkinson Soiled Linen Chutes are made of aluminum sheets. Intake doors, intake extensions, and discharge doors also of aluminum.

Metal trim around intake doors furnished in aluminum or steel, finished as specified.

Wilkinson Rubbish Chute

With the exception that Wilkinson Rubbish Chutes are made of galvanized iron instead of aluminum and that their intakes have double doors instead of single doors, these chutes are identical with and embody all of the advantages of Wilkinson Soiled Linen Chutes.

Intakes of the Wilkinson Rubbish Chute are equipped with double interlocking aluminum doors to prevent back-draft and minimize fire hazard. Pressing the foot lever opens the hopper door and the inner door locks shut. Removing the foot closes the hopper door. As the hopper door is closed the inner door opens long enough to let material pass into the chute, then closes automatically.

All doors and intake extensions are of aluminum as in the Wilkinson Soiled Linen Chute but the chute proper is made of galvanized iron to prevent rust or corrosion. This copper-bearing metal will outlast steel or iron from five to eight times.

Wilkinson Waste Towel Chute

For the easy disposal of waste paper towels in toilet rooms. Chute of aluminum patterned after Wilkinson Soiled Linen Chutes. Single, top-hinged, inside swinging intake doors. Doors and frames furnished in aluminum, bronze, steel or other metals, finished as specified.

Specify Wilkinson Chutes

Wilkinson Soiled Linen or Rubbish Chutes are made in sizes for every need. The correct applications are shown below. Send for detail plans and specifications.

Type or Model No.	Chute size, in.			Intake door, in.		Discharge door, in.	
	Width	Depth	Diam.	Width	Height	Width	Height

ALLEN AIR APPLIANCE CO., INC.

Manufacturers of Stationary and Portable Vacuum Cleaners

94 East 45th Street
NEW YORK, N. Y.

REPRESENTATIVES IN ALL PRINCIPAL CITIES

Products

STATIONARY and PORTABLE VACUUM CLEANERS.

Also Pneumatic Conveying Systems; Centrifugal Blowers and Exhausters and Allied Lines.

"Triple-A" Stationary Vacuum Cleaners

These are made in three distinctly separate groups or classes, as follows:

- (1) Institutional types
- (2) Residential types
- (3) Industrial types

This condensed catalogue sheet is intended only to give brief information concerning classes 1 and 2, i.e., for institutional and residential service. Condensed data concerning "Triple-A," industrial types of pneumatic sweeping and conveying systems, may be found in SWEET'S ENGINEERING CATALOGUES.

"Triple-A" Stationary Machines are made in a complete range of sizes and types, suitable for all classes of buildings, from the smallest residence to the largest hotel or office building. Standard sizes, most frequently used, are shown in the following schedule. Complete data concerning these standard machines, or concerning special types of systems for unusual conditions, will be promptly forwarded upon request.

CONDENSED SCHEDULE OF STANDARD SIZES

Size	Sweeper capacity	Motor, hp.	Duty
51-C	1	$\frac{1}{2}$	Light
11-B	1	1	Medium
21-B	1	2	Medium
30-A	1	3	Heavy
50-A	2	5	Heavy
75-A	3	$7\frac{1}{2}$	Heavy
100-A	4	10	Heavy
150-A	6	15	Heavy
200-A	8	20	Heavy
250-A	10	25	Heavy
300-A	12	30	Heavy
400-A	16	40	Heavy
500-A	20	50	Heavy
750-A	30	75	Heavy
1000-A	40	100	Heavy

Light and Medium Duty Machines

The light and medium duty machines listed above are intended for service in residences and other smaller buildings where the service conditions are not as severe as in hotels, schools, theaters, etc. These light and medium duty machines are of the positive rotary type, equipped with automatic lubrication and requiring practically no care or attention. In every respect, these machines are ideally suited for residential and small building service, being extremely quiet in operation, and using small diameter, light-weight hose which is suitable for operation by the housewife or maid.

Heavy Duty Machines

All of the heavy duty machines are of the multi-stage centrifugal type, and are intended for heavy, continuous service in all classes of buildings, including schools, hotels, theaters, clubs, hospitals, municipal buildings, churches, etc.

Construction Details—The accompanying illustration shows a typical heavy duty stationary machine, of the multi-sweeper type complete with dust separating tank.

Attention is called to the substantial cast iron construction throughout, both exhauster and motor being mounted on a common cast iron base, and directly connected by means of a high grade, flexible shaft coupling. The exhauster itself is of cast iron, sectional construction, and is provided with outboard ball bearings of the self-lubricating type, requiring the minimum of attention.

The shaft is of heavy steel, accurately ground to size and supported by ball bearings at both

Stationary Vacuum Cleaner

ends. The impellers are one-piece aluminum castings, accurately finished and balanced, and with ample clearances throughout.

Standard "Triple-A" Dust Separators are of the combination precipitation and filtration type, thus insuring practically 100% separation of dust before the air enters the exhauster. This type of separator is recommended for standard service, but other special types can be supplied when required.

Cleaning Tools and Accessories

"Triple-A" Cleaning Tools and Accessories are of the very highest grade construction throughout. Their design is based on more than twenty-five years' experience, and they are fully supplied with all necessary hinge and swivel joints for easy, fast, and convenient operation. Complete information concerning "Triple-A" Cleaning Tools, Hose, Inlet Valves, etc., will be promptly supplied upon request.

Portable Machines

The "Triple-A" line also includes several sizes of medium and heavy duty portable vacuum cleaners, ranging from 1 to 3 hp. for service in hotels, garages, etc., and 3 to 15 hp. for heavy duty industrial service. Complete data on request.

Installations

"Triple-A" machines and systems are in satisfactory service not only in all parts of the United States, but in many foreign countries. Having no wearing parts other than the ball bearings, these machines render dependable service over periods of many years, without the slightest expense for repair or upkeep.

A Few of Many Hundreds of Satisfactory Installations

Piedmont Hotel, Atlanta, Ga.
Anthony Wayne School, Detroit, Mich. (and about six additional schools in Detroit)
Claridge Hotel, Atlantic City, N. J.

REPRESENTATIVES IN PRINCIPAL CITIES

Products

"Tabco" PNEUMATIC CLEANING and SWEEPING SYSTEMS for theatres, hotels, schools, office and institutional buildings.

Mechanical Features of "Tabco" Systems

"Tabco" Cleaners are extremely simple and sturdy. There is but one moving part—the balanced impeller which runs without vibration, and which turns in lubricant-packed and anti-friction bearings which have proved to be practically wearproof. There are no wearing parts whatever—valves, pistons or diaphragms. Superior design assures maximum air displacement per unit of power—high economy.

"Tabco" units are inherently self-governing—no auxiliary power regulator or unloading device is needed. A uniform vacuum is maintained without pulsations, and power is automatically proportioned to load.

"Tabco" Stationary Cleaner Units

There are self-contained units made in a series of sizes ranging from $\frac{3}{8}$ to 100 hp. Each consists of a multistage centrifugal exhauster direct-connected to a motor, and a compact dust-collecting tank with centrifugal separator, dust bags, and removable dust can. "Tabco" cleaning tools and accessories especially designed for institutional cleaning have been accepted by the leading architects and engineers throughout the country.

"Tabco" Pneumatic Sweeping Systems

This company is the

"Tabco" Stationary Pneumatic Cleaning Unit

Consists of turbo exhauster, direct-connected motor, and dust separating and collecting tank

pioneer in the design, manufacture and installation of heavy-duty pneumatic cleaning systems, as distinguished from the common "vacuum cleaner." Its extensive specialized experience covers installations of "Tabco" systems in

schools, hotels, theatres, public buildings, office buildings, and hospitals—as well as in industrial plants in wide variety. Since each installation involves distinct problems in engineering design, experience in such problems is as essential to success as high quality of equipment. Each "Tabco" installation is made up of standard "Tabco" units of equipment, combined in a complete system to best meet the conditions of the job. The uniform success thus attained justifies the extreme en-

gineering care given to each special case.

Engineering Service

As each installation is a separate engineering problem, the company's engineers will welcome an opportunity to work with architects and to make layouts which will be the basis of intelligent estimates of cost. No obligation is incurred in taking advantage of this service.

Complete descriptive "Tabco" literature will be sent on request.

"Tabco" Portable Cleaner Units

These small but powerful cleaners are provided with a $\frac{3}{4}$ hp. motor driven centrifugal exhauster

THE SPENCER TURBINE CO.

Manufacturers of Blowers and Exhausters

488 New Park Avenue
HARTFORD, CONN.

Products

SPENCER TURBINE VACUUM CLEANERS; SWIMMING POOL CLEANING EQUIPMENT; BOILER FLUE CLEANING APPARATUS.

Also manufacturers of Turbine Compressors and Exhausters, Organ Blowers (Spencer Steel Orgoblo).

The Spencer System of Vacuum Cleaning

The Spencer multistage turbine system has met with the approval of architects and engineers, and has been installed in more than 10,000 hotels, theaters, office buildings, hospitals, schools, banks, etc. List of important installations will be gladly sent.

The system consists of a turbine exhauster, a piping system with outlets throughout the building and an equipment of light weight hose and tools for cleaning all floors, walls, furniture, etc.

All Spencer cleaners are of the multistage low velocity turbine type, which adapts itself to the proportions of vacuum and volume required for vacuum cleaning work better than any other type of exhauster.

Simplicity in design and high grade construction insure low maintenance cost. The entire system is designed to produce correct air stream conditions, and to do universal vacuum cleaning with uniform efficiency, speed and thoroughness.

Advantages of the Spencer System

All dirt is sucked out through a tube and no foul exhaust air or any part of the dust is discharged back into the rooms.

There is nothing to handle in the rooms but the hose and cleaning tools, which are so light and easy to use that a maid, or even a child, enjoys using them.

All the machinery is in the basement where it is not moved or handled, and is therefore not skimped in size, weight or efficiency; it hence supplies a strong, even vacuum, so well controlled as to avoid all possibility of injury to rugs or fabric, and removes all dust and grit from cracks or pores of bare floors.

Spencer Turbine Vacuum Cleaners

The Spencer multistage turbine is a machine of great simplicity and durability. Its one moving part is the multistage impeller which revolves smoothly and quietly on ball bearings within its casing, with wide clearances on all sides. There are no pistons, valves, water seals, drive chains, belts, cloth bags or wet auxiliary tanks; no close adjustments to be disturbed by dirt. Without the use of complicated and troublesome governing apparatus, the multistage fan in-

herently maintains a constant vacuum under a varying volume and is so perfectly controlled that the turbine responds to, and co-operates with, every movement of the tool at the cleaning hose.

Turbine Impellers or Fans—Securely fastened to the shaft, making one single moving element which revolves smoothly and quietly within the deflectors.

There is a wide clearance of from $\frac{1}{8}$ to $\frac{3}{8}$ in. between the stationary and moving elements throughout the entire turbine. The bearings are the highest grade and of liberal capacity.

Separators—Of the centrifugal type, of high efficiency and with dirt receptacles of large size.

On the $\frac{3}{4}$ hp. machines the dirt receptacles are in the base of the machine, while the 2 hp. and larger equipments have the dirt separators as a separate unit.

Motors—Are of the highest grade and the most approved makes.

Tools—Superiority of cleaning implements and accessories is universally acknowledged. Spencer tools are designed with openings in correct proportion to the rest of the system; also with special consideration as to convenience and fitness of the various requirements. Strong in construction, light in weight, and shaped for fast and effective work. Tools are equipped with Spencer patented universal controllable swivel, which enables operator to remove dirt beyond the reach of the rigid tool.

All wearing surfaces are renewable. Tools are attached to handle by means of steel locking chuck.

$\frac{3}{4}$ Hp. Vertical Spencer Turbine

5 Hp. Horizontal Spencer Turbine

Specifications—While our engineering department prefers to examine each particular job before making definite recommendations regarding layouts or specifications, the following may serve as a general guide when this is not possible:

Piping System—Inasmuch as the hose causes greater vacuum loss than any other part of the system, requires labor in handling, and eventually wears out, while the stationary piping system possesses none of these characteristics, it is obvious that to secure permanent efficiency plenty of piping and short hose runs are the most economical, besides rendering the entire equipment much more rapid, efficient and easily handled by the operator.

A dirt handling pipe system must be of smooth, uniform bore throughout both pipe and fittings. Long turn "drainage" or Durham fittings with horizontally disposed clean-out plugs at the foot of risers have proved satisfactory. Long sweep pipe bends should, however, be used at points where the dirt is required to go from a horizontal pipe up a vertical one.

Spencer Horizontal Turbine

For large installations THE SPENCER TURBINE CO. has developed a line of horizontal direct connected turbine equipments operating at a speed of 1750 r.p.m. as distinguished from the 3500 r.p.m. apparatus which has heretofore characterized all fan and turbine type vacuum cleaners. In addition to this desirable feature, this equipment retains all the superior features which have characterized the earlier Spencer models.

Piping should not be so small as to require too high vacuum, high velocity and low density with the accompanying reduction in carrying capacity and increase in "sand blast" wear; nor on the other hand so large as to reduce the velocity sufficiently to permit "dirt settling."

Rules for Determining Pipe Sizes—Size of pipe used for any vacuum cleaner installation should be that given at left of diagram, horizontally opposite the intersection of curve for the total number of sweepers to be operated simultaneously with vertical line above the number corresponding to total length of pipe from the end of exhaust pipe to the most remote inlet valve in the building.

The curves shown on this page give the correct size of piping for any vacuum cleaning system.

Size of Machine to Install—The following rules afford a reasonably accurate and definite method of determining the sweeper capacity of plant required for any given building, if heavy duty standards are used, i. e., a minimum vacuum of 2 in. Hg. with $\frac{7}{8}$ -in. round sharp edged open orifice for bare floor sweeping and 3-in. Hg. with a similar $\frac{7}{8}$ -in. orifice for carpet cleaning, both at end of 50 ft. of hose with all sweepers working. Use following formula:

The square foot floor or carpet area divided by 7500 times the available hours for each cleaning equals the number of sweepers required.

Capacity Test—For heavy duty work specification should provide that the plant shall maintain a minimum vacuum of at least 2 in. Hg. in back of each of as many $\frac{7}{8}$ -in. round sharp edged orifices as the system is designed to operate simultaneously, and a vacuum of not less than 3 in. Hg. in back of

each of as many $\frac{7}{8}$ -in. round sharp edged orifices as the system is designed to operate simultaneously. This test to be made at the end of 50 ft. of hose.

Piping Diagram Based on Use of 1 1/2-in. Hose for Each Sweeper

If fewer sweepers are to be operated simultaneously through part of piping system, the size pipe for such part can be reduced to that given in diagram for the number of sweepers that will actually be used simultaneously through that part of piping, based on same total length of pipe from end of exhaust pipe to most remote inlet valve in the building.

Truck Type Cleaners

The Spencer portable truck machine embodies the same principles of design and construction as characterize the larger stationary equipments. The primary separator collecting 95% of the dirt is of the centrifugal type; the secondary separator, which is only called upon to handle approximately 5% of the dirt, is of the bag type.

The equipment is thoroughly high grade in construction and offers the maximum of power consistent with reasonable weight and ease of handling.

Boiler Flue Cleaning Apparatus

By installing a few additional attachments the Spencer system can be used in cleaning horizontal return tubular and cast iron sectional boilers with a remarkable economy in fuel consumption. The saving in fuel alone frequently amounts to a liberal return on the entire investment for the cleaning system.

Swimming Pool Cleaning Equipment

By means of special cleaning tools usually employed in connection with the pump on the filtering system it is possible to remove accumulated sediment from swimming pools without the waste of water involved in draining the pool.

Engineering Service

The Engineering Department offers its services without obligation in recommending the proper size and type of equipment, piping layout, or other engineering details.

Installations

The Spencer system is installed in a very large number of the best buildings of all types throughout the United States and Canada. Lack of space prevents mentioning any of these particular buildings but full information will be gladly furnished on inquiry.

DUPLEX INCINERATOR DIVISION

OF THE DUPLEX HANGER COMPANY

Manufacturers of Duplex-Krause Incinerators

East 53rd Street and Lakeside Avenue, CLEVELAND, OHIO

Product

BUILT-IN STANDARD CHIMNEY-FED and Special Incinerators for all purposes.

Description

The Duplex-Krause Incinerator is arranged with a brick combustion chamber of highly efficient, though simple, design having a brick lining.

It is located at the base of a chimney, usually in the basement of the building.

Into this chamber is built grate rests with full dumping grates, wall bearings, stops, waste distributor, access doors, draft regulator and miscellaneous supporting trim.

The chimney starts on top of the incinerator and extends straight up through the building, usually in the kitchen wall or convenient to corridor or rear porch. Service or receiving hopper doors are built into chimney wall at the most convenient point on the floor or floors above.

All metal parts are furnished by us with $\frac{3}{4}$ -in. scale installation detail drawings for the guidance of the mason in setting the parts.

LOCAL REPRESENTATIVE

Operation

All waste—garbage, paper, sweepings, etc.—is deposited in the receiving hopper doors, on any number of floors above the basement-located incinerator.

Through the chimney, it drops to incinerator chamber where, through the Duplex-Krause method of aeration, it dries for burning.

When incinerator is nearly full, the contents are lighted and are burned without the use of any fuel other than the waste itself and without offensive odor. The principles of operation are more fully described below.

Broad Guarantee

Every Duplex-Krause Incinerator is sold with a broad guarantee and free service policy that insure the satisfaction of the purchaser.

Suggested Insert for Architects' Specifications

The Contractor (Mason Contractor) shall furnish all materials and labor to construct where shown on plans Duplex-Krause Incinerator Models according to detail plans furnished by the DUPLEX INCINERATOR DIVISION of the Duplex Hanger Company, Cleveland, Ohio.

OUTSTANDING ADVANTAGES OF DUPLEX-KRAUSE INCINERATORS

Economy, Operation, etc.

Duplex-Krause Incinerators are economical because they provide Large Capacity; Operation without Cost; Fire Safety and Permanence.

Full dumping grates of heavy pattern are a non-clogging type that will not tip under load, yet are easily dumped with the unbreakable forged lever.

Fire and ash doors are of special design, having carefully machined gray iron castings with deep wall frames that will not loosen, and are furnished in various sizes to meet every requirement.

Basement location allows use of available space—where ash removal is fitting and convenient—where no heat is radiated into the kitchen in summer, yet the receiving door is right at hand for convenient waste disposal.

Principles of Construction

Aerator Lattice—Air is drawn by the chimney through the draft regulator (R) into the primary chamber (PC) and is distributed by the aerator lattice (L) which extends the full width and height of the incinerator. This current of air passes through and over all the garbage and other waste in the main incinerator chamber.

Between Burnings—This greater air circulation prepares the waste for burning by evaporation of moisture.

During Burning—The incoming air is heated by the hot fire brick in the aerator lattice which is in contact with the fire, feeding a perfectly distributed supply of preheated oxygen to maintain combustion on top of the waste accumulation. Odorous gases released by the heat approaching waste below must pass through the fire and be sterilized or consumed. The draft regulator allows complete control.

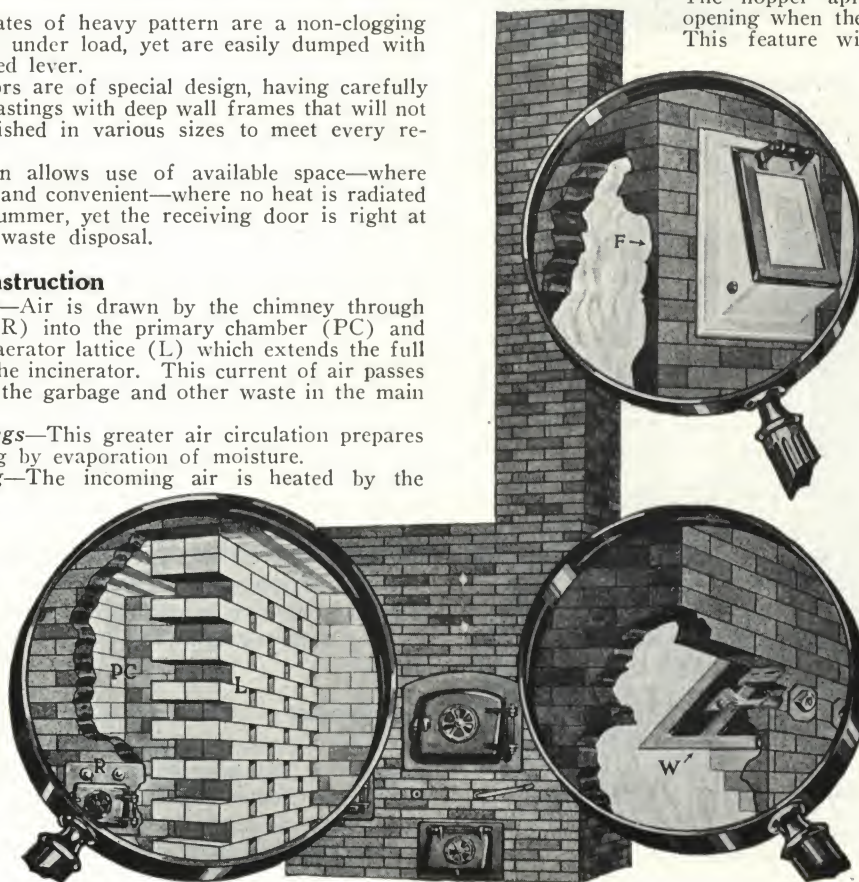

Receiving Doors—The separate wall sleeve frame (F) is built into the chimney wall. Then, after the building is completed, the finished hopper door and trim frame are put on.

The hopper apron closes the chimney opening when the receiving door is open. This feature with

carefully fitted and ground parts, and the normal suction of the chimney draft, prevent any possibility of leakage into room of smoke, odors or gases.

Finish—The modern idea of color and beauty in the home has extended to the kitchen and service hall. Duplex-Krause Standard Vitreous Porcelain Enameled or Chromium Receiving Doors are permanently beautiful fixtures that add much to the attractiveness and value of the building.

Waste Distributor—The waste distributor (W) prevents the compression of accumulated waste due to the impact of its fall from upper floors of the building and shifts the waste in a loose pile toward the point of incoming air to insure its contact with drying current.

Model S

For—Residences not exceeding 10 rooms.
Minimum chimney flue 12x12 in.
Standard fire door, No. D-1, openings 17x11 in.
Length 4 ft. 6 in., width 3 ft. 5 in., height 6 ft. 3 in. to 6 ft. 10 in.

Model B

For—Residences of 10 to 14 rooms.
Apartments under 18 rooms.
Minimum chimney flue 12x12 in., if receiving doors 1 floor.
Minimum chimney flue 16x16 in., if receiving doors 2 to 4 floors.
Standard fire door, No. D-1, opening 17x11 in.
Length 4 ft. 8 in., width 3 ft. 9 in., height 6 ft. 3 in. to 6 ft. 10 in.

Model D

For—Very large residences.
Apartments 18 to 40 rooms.
Minimum chimney flue 16x16 in., if receiving doors 2 to 4 floors.
Standard fire door, No. D-1, opening 17x11 in.
Length 5 ft. 9 in., width 4 ft., height 6 ft. 3 in. to 7 ft. 6 in.

Model L

For—Apartments 40 to 80 rooms.
Hospitals under 500 beds.
Schools under 300 students.
Small stores—1 to 6 average group.
Use for Model D purposes when 22x18-in. fire door desired.
Minimum chimney flue 16x16 in., if receiving doors 1 to 4 floors.
Minimum chimney flue 20x20 in., if receiving doors 5 to 7 floors.
Standard fire door, No. D-2, opening 22x18 in.
Length 6 ft., width 4 ft. 4 in., height 6 ft. 3 in. to 7 ft. 6 in.

Model T

For—Apartments 80 to 120 rooms.
Hospitals 50 to 90 beds.
Schools 300 to 500 students.
Small stores 6 to 8 average group.

Minimum chimney flue 16x16 in., if receiving doors 1 to 4 floors.
Minimum chimney flue 20x20 in., if receiving doors 5 to 7 floors.
Standard fire door, No. D-2, opening 22x18 in.
Length 7 ft., width 4 ft., height 6 ft. 10 in. to 8 ft. 2 in.

Model N

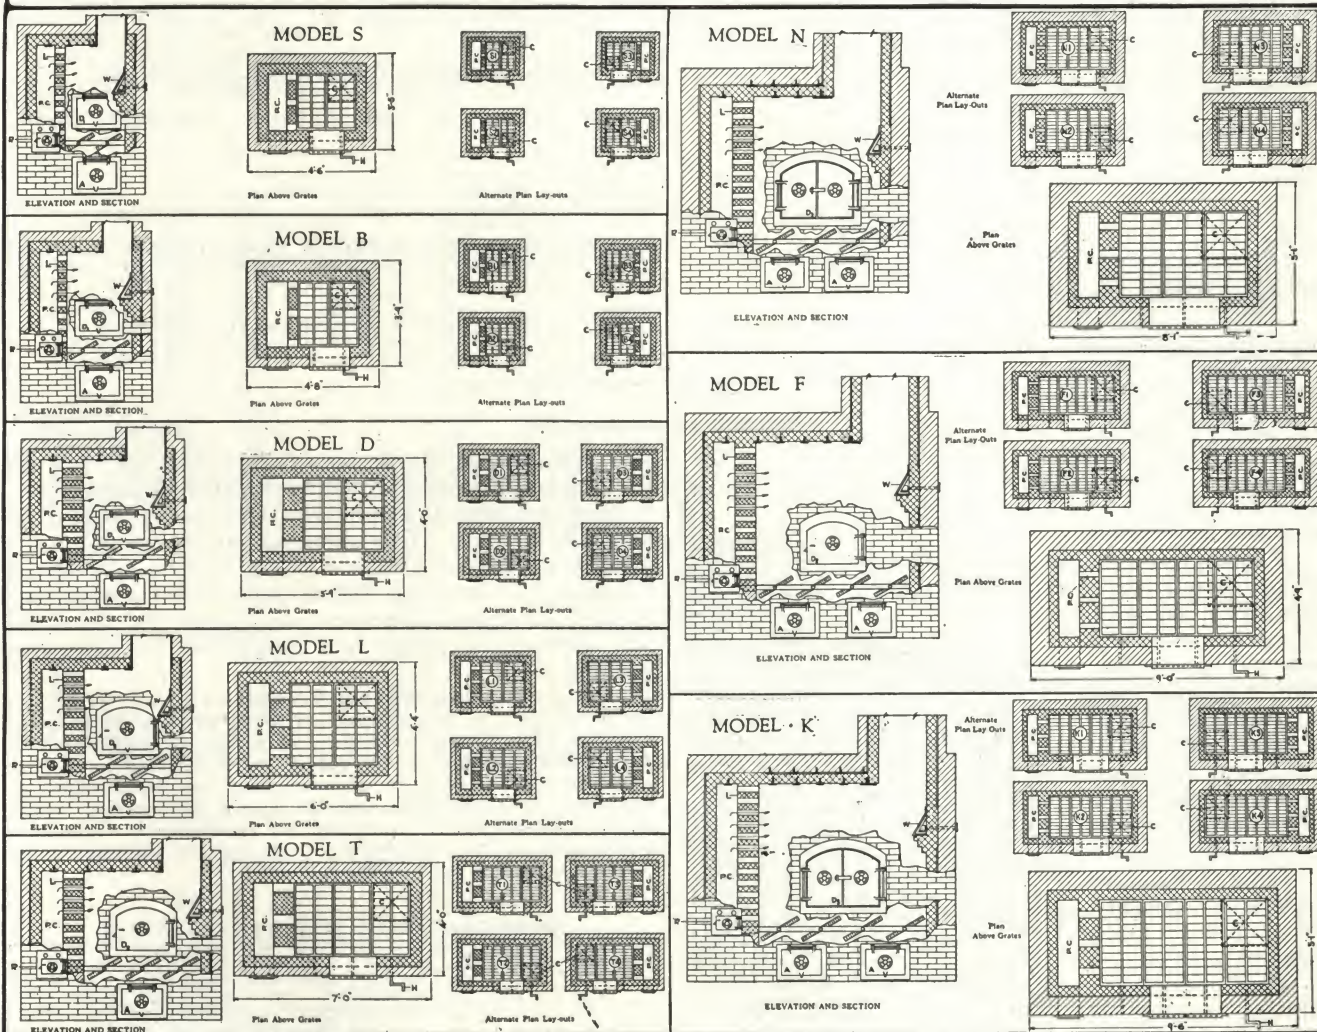

For—Apartments 120 to 160 rooms.
Hospitals 90 to 120 beds.
Schools 500 to 700 students.
Small stores 8 to 10 average group.
Use for Model T purposes when 30x24-in. fire door desired.
Minimum chimney flue 16x16 in., if receiving doors 1 to 4 floors.
Minimum chimney flue 20x20 in., if receiving doors 5 to 7 floors.
Minimum chimney flue 24x24 in., if receiving doors over 7 floors.
Standard fire door, No. D-3, opening 30x24 in.
Length 8 ft. 1 in., width 5 ft. 1 in., height 7 ft. 6 in. to 8 ft. 2 in.

Model F

For—Apartments 160 to 240 rooms.
Hospitals 120 to 180 beds.
Schools 700 to 1000 students.
Small stores 10 to 15 average group.
Use for Model F purposes when 30x24-in. fire door desired.
Minimum chimney flue 16x16 in., if receiving doors 1 to 4 floors.
Minimum chimney flue 20x20 in., if receiving doors 5 to 7 floors.
Minimum chimney flue 24x24 in., if receiving doors over 7 floors.
Standard fire door, No. D-2, opening 22x18 in.
Length 9 ft., width 4 ft. 9 in., height 7 ft. 6 in. to 8 ft. 2 in.

Model K

For—Apartments 240 to 320 rooms.
Hospitals 180 to 260 beds.
Schools 1000 to 1200 students.
Small stores 15 to 18 average group.
Use for Model F purposes when 30x24-in. fire door desired.
Minimum chimney flue 16x16 in., if receiving doors 1 to 4 floors.
Minimum chimney flue 20x20 in., if receiving doors 5 to 7 floors.
Minimum chimney flue 24x24 in., if receiving doors over 7 floors.
Standard fire door, No. D-3, opening 30x24 in.
Length 9 ft. 6 in., width 5 ft. 1 in., height 7 ft. 6 in. to 8 ft. 2 in.

Amherst Garbage Incinerator

For destroying kitchen garbage in homes occupied by six to twelve persons.

Description—The Amherst incinerator is built on the principle of heat convergence. It is heavily insulated and so constructed that the hot gases are utilized to destroy all odors of incineration. Its appearance is equal to the demands of the finest homes.

Operation—Deposit garbage in hopper, adjust timing device for burning period, ignite gas and the

garbage will be destroyed.

Types and Sizes—Made in "Portable" and "Built-in" types; two sizes, Nos. 20 and 30, for kitchen, basement or garage installation. Requires 3/4-in. gas connection and 6-in. smoke pipe.

AMHERST GARBAGE AND HOSPITAL INCINERATORS

Size No.	Capacity, bu.	Height, in.	Width, in.	Depth, in.	Weight, lb.
20	1	42	22	22	425
30	2	43 1/2	24	24	525

Sanotype Refuse Incinerator

The Sanotype incinerator is a cast iron sectional incinerator for rubbish and garbage disposal in resi-

dences, apartments and hospitals. Made in two models, designated as "R" and "C," illustrated below. Each model is made in two sizes, designated as No. 5 and No. 10.

MODEL R
For Pipe Connection to Chimney, Direct Feeding

MODEL C
For Connection to Chimneys, which Serve also as Feeding Chutes from Floors Above

Sanotype Refuse Incinerators—Single Section

Size No.	Capacity, bu.	Height, in.	Width, in.	Depth, in.	Weight, lb.
5	4	46	30	23	735
10	6	46	40	23	1050

Each model may be furnished in two sections, thereby doubling the capacity.

RECOMMENDATIONS FOR SIZE OF SANOTYPE INSTALLATIONS

Purpose	No. 5	No. 10
Residence	10 to 20 persons	15 to 30 persons
Apartment	2 to 4 apartments, rooms not more than 16 15 beds	4 to 6 apartments, rooms not more than 24 25 beds
Hospital		

Bricktype Incinerator

A built-in chimney fed incinerator, located in the basement, for destroying kitchen garbage and waste material in homes, apartment houses, hospitals and institutions.

Description—Consists of a brick combustion chamber lined with standard fire brick and equipped with horizontal, stationary grates. These grates are on a level with the cleanout door for easy removal of sterilized, non-combustible articles. Stationary grates are 14 in. from ash pit floor providing maximum incinerator capacity. The location of the grates so near the ash pit floor permits a sufficient amount of heat to radiate, absorbing the moisture and destroying the vermin in the ash pit.

Bricktype Incinerator

The patented, automatic airport introduces air into the combustion chamber providing a controlled supply of oxygen for complete and odorless destruction of garbage and refuse. Attractive aluminum receiving doors are built in the flue and located in the various apartments. These hopper doors are packed with asbestos which has a two-fold purpose—preventing leakage as the doors are hermetically sealed and eliminating the annoying metallic slam.

For the Building Already Erected—The same incinerator can be installed in an old residence using existing flues in conjunction with furnace or heaters at a nominal expense. This contemplates the use of our special receiving door so that all refuse can be disposed of without going into the basement or outdoors. The floor door operates with a disappearing treadle and is guaranteed to be sanitary and smokeproof. The same mechanical features of efficiency in drying and burning are incorporated in this type of incinerator.

KAHN PRODUCTS CO.

Manufacturers of "Kahn" Incinerators

2216-2218 West Columbia Avenue

PHILADELPHIA, PA.

"Kahn" Incinerator

Made in seven standard sizes for installation in residences, apartment houses, schools, hospitals and institutions. The entire outfit consists essentially of a combustion chamber built in the basement, the stack or flue with receiving doors at each floor landing, and the grates, lighting and ash pit doors.

The refuse is wrapped in paper and dropped through the receiving doors to the combustion chamber. When a sufficient amount has accumulated in the combustion chamber (generally about once a day) it is ignited through the lighting door. There is no fuel required for maintenance of the "Kahn"; the garbage and refuse bundled in waste paper are sufficient to consume all materials and odors.

The "Kahn" Is Fireproof—The incinerator itself is so designed that it will create a powerful draft, and yet it is such that this draft can not in any manner operate as a fire hazard. The receiving doors, installed at each floor, are airtight and close automatically. They are lined with galvanized iron hoppers, especially designed so as to prevent smoke, flare or odors

from emanating from the flue while refuse is being deposited.

The "Kahn" Handles All Refuse—Not only garbage but broken crockery, bottles and even tin cans may be deposited in the incinerator. The ash deposits underneath can be cleaned out at regular intervals through the cleanout door.

An Absolute Guarantee—"Kahn" Incinerators are guaranteed when installed in accordance with our detail drawings and specifications. Should our Incinerator fail in any way, we will either rectify the cause of the trouble or we will refund all payments and pay all transportation charges when parts are returned to us.

Write for testimonial letters from satisfied users. They will be mailed on request.

Architects' Specifications

The Incinerator shall be the Kahn, Type as made by KAHN PRODUCTS CO., 2216-2218 West Columbia Avenue, Philadelphia, Pa., and shall be installed in accordance with the detail drawings as furnished by the manufacturers. All material shall be first class and the Incinerator shall be of such size to take care of the number of apartments as shown on plans.

Note: For increased size of combustion chamber build as per Detail "Z." We also manufacture Portable Types for installation in buildings that are already constructed.

Products

THE KERNERATOR CHIMNEY-FED INCINERATOR, BASEMENT-FED and ESTATE TYPE, made in eight standard models, and other designs to meet special requirements.

Garbage and Waste Disposal Without Cost

Fire-safe, sanitary and odorless disposal of garbage and rubbish of all kinds by burning *without cost*. Made in sizes to fit the various requirements of homes, apartments, schools, hospitals and any other type of building where economical and convenient garbage and refuse disposal is desirable.

Guaranteed Incineration by the Pioneer Flue-fed Incinerator Company

Nearly twenty years ago the KERNER INCINERATOR COMPANY introduced flue-fed incineration. Today it is one of the largest incinerator companies in the world—a position established through continuous specialization in the manufacture of a single product of a proven practicability and merit. The Kernerator is the only incinerator legally authorized to use the by-pass or secondary flue—a patented, exclusive feature. The company guarantees the Kernerator to be *permanently* satisfactory—a guarantee backed by recognized integrity and a stable, trained organization throughout the country.

Kernerator Service

Through nearly twenty years of contact with every phase of incineration and as a result of exhaustive and constant study of conditions essential to successful flue-fed incineration, the KERNER INCINERATOR COMPANY is enabled to render valuable service in connection with this equipment.

We are in a position to supply authoritative information, drawn from original sources, on important features of successful incineration—factors of moisture, air movement, smoke control, gas distillation and flame control. A trained organization of experts in incineration, who know what *will* and what *will not* work successfully, will promptly co-operate with the architect to the full extent.

LOCAL REPRESENTATIVE

KERNERATOR
INCINERATION

*"Garbage and Waste Disposal
for New and Existing Buildings"*

Description of the Kernerator

The Chimney-fed Kernerator consists of a brick combustion chamber, with fire brick lining, located in the basement of the building at the base of a *straight* chimney flue. It is constructed when the building is erected in accordance with clear detailed Kernerator working drawings and specifications.

Into this incinerating chamber is built a special arrangement of grates with a patented by-pass flue which provides proper draft control and insures complete odorless combustion of garbage and waste.

One or more receiving hopper doors are located in the flue on the floor or floors above, opening into kitchens, pantries or adjacent halls, etc. The flue serves as a fallway for the refuse deposited in the hopper doors and also as a chimney to carry off the products of combustion during the burning periods.

Kernerator Operation

No gas, coal or other commercial fuel is required.

All garbage and waste (sweepings, waste paper, tin cans, broken crockery, bottles, etc.) are placed in the hopper doors. When the doors are closed this refuse falls down the flue into the incinerator combustion chamber where it spreads out on the grates into a more or less separated and loose pile, permitting the constant flow of air up the by-pass to circulate through and around it causing a surprising amount of evaporation between burnings.

When the combustion chamber is nearly full the refuse is lighted (a match does it) and the whole mass burns without further attention. Due to the by-pass flue, combustion is from the top downward and all unpleasant odors are destroyed.

The fire feeds upon the waste paper and other combustible material and gradually dries the damp substances so that they also burn to a fine ash. After several burnings the ashes along with cans, bottles and other non-combustible articles, which are thoroughly flame sterilized, are dumped into the ash pit for removal every few weeks.

Interior Construction and Operation of Kernerator

Notice the draft reaching the point of burning through by-pass grate. Fire is always on top of the burning material, consuming offensive odors

Importance of the By-pass Flue and Vertical Grate

At the side of the horizontal grates, upon which the refuse falls, is the by-pass or upright grate. Behind this is the by-pass or secondary flue. This exclusive feature permits air to pass up from the ash pit through and over the refuse material spread on the horizontal grates. Between burnings this circulation of air causes considerable evaporation. During burnings air comes up the by-pass flue, passes through the vertical grate and feeds heated oxygen to the top of the fire. As the heat liberates the gases from the refuse beneath they pass up through the flames, are mixed with a plentiful supply of heated air at this point and are consumed.

No Heat, Smoke or Odor Escapes into the Building

There is always a draft into and up the chimney, consequently when the hopper doors are open, either between burnings or during burnings, the air is drawn from the rooms into and up the flue. There is never a possibility of either heat or smoke escaping into the room—the suction of the chimney draft prevents it.

Flue Is Always Clean and Sanitary

The heat from the burning sterilizes the entire chimney flue, maintaining a clean, sanitary condition. The oily soot and creosote on the inside of the flue walls prevent waste particles from adhering. Falling waste prevents any large accumulation of soot.

Kernerator Hopper Doors

Kernerator hopper doors are of heavy gray iron castings with edges, and seats on which they rest, emery ground, carefully fitted to make them as airtight as possible. The frames, weighing from 27 to 47 lbs., depending on size, are firmly anchored into the masonry. The back aprons (hoppers) on doors are so constructed that the opening into the flue is closed when the door is open. The hopper limits the size of the package which can be deposited in the flue but leaves sufficient opening to take ordinary packages of garbage and waste.

Hopper Door Model 003 is $11\frac{1}{4} \times 14\frac{1}{4}$ in. measured outside the door casing. The daylight opening is $8\frac{1}{4} \times 8\frac{1}{4}$ in. The over-all width of frame is 10 in. This door cannot be used in flues less than 12×12 in. (inside dimensions).

Hopper Door Model 005 (for schools, hospitals and other larger installation) is 15×19 in. measured outside the door casing. The daylight opening is $11\frac{1}{4} \times 12$ in. The over-all width of frame is $13\frac{1}{2}$ in. This door cannot be used in flues less than 20×20 in.

Combustion Chamber and Two Methods of Placing Hopper Doors on Floors Above

One in kitchen, the other in apartment corridor service closet

(inside dimensions). Where the building is six stories or higher use this door in a flue not less than 24×24 in. (inside dimensions).

Hopper Door Model 1A3 (for cases where a door larger than Model 005 adds efficiency) is 18×18 in. measured outside the door casing. Daylight opening is $14\frac{1}{2} \times 11\frac{1}{2}$ in. Over-all width of frame is $16\frac{1}{2}$ in. This door cannot be used in flues less than 24×24 in. (inside dimensions).

Double and Single Leaf Firing or Charging Door

In the larger apartment houses, apartment hotels, hospitals and institutions the Kernerator Fire Door opening into the combustion chamber in the basement is frequently used for feeding purposes. The larger this fire door the more satisfactory the incinerator installation.

The large single leaf fire door (clear opening 22×18 in.—weight 110 lbs.) is standard in the Kernerator Models G, O and L.

A larger double leaf fire door (clear opening 30×22 in.—weight 220 lbs.) is standard on Kernerator Models M and P.

These large fire doors enable the janitor or building custodian to feed berry crates and other bulky waste not delivered to the upper floors, directly into the incinerator combustion chamber in the basement. It also provides an adequate opening for conveniently stoking of the fire.

Selection of Model—Kernerator Detailed Plans

Select the correct sized model from the capacities noted on layouts on Kernerator Pages 3 to 7, inclusive. Then choose the basement arrangement of that model which will best meet the building conditions. On application, the KERNER INCINERATOR COMPANY will furnish $\frac{1}{2}$ -in. scale working drawings and specifications of the model and basement arrangement selected.

Where none of the standard arrangements meet the particular basement conditions consult the local Kernerator representative or send to the home office a sketch of the conditions surrounding the flue to be used (basement and typical floor plan and clear basement height) and our drafting department will prepare special drawings to fit these conditions.

Hopper Door and Frame Complete

Note that the back apron closes off the opening into the flue when the door is open

Large Single Leaf Firing Door

Standard on Models G, O and L

Double Leaf Firing Door

Standard on Models M and P

Note particularly descriptive text on Kernerator Pages 6 and 7 under headings "General Information," "Construction Details" and "Flue Construction." Observe carefully the flue size requirements given with each standard model and plan arrangement.

Incinerator Specifications

(A) **Work Included**—The work included under this heading is the furnishing of all materials and labor for the complete Incineration System consisting of (state number) flue (s) and combustion chamber (s) (give locations) and hopper doors opening into the following rooms (list or locate).

(B) **General**—The Incineration System shall be Kernerator as manufactured by the KERNER INCINERATOR COMPANY, Milwaukee, Wis.

(C) **Materials and Workmanship**—All materials and workmanship shall be the best of their respective kinds meeting fully the standard specification requirements of the KERNER INCINERATOR COMPANY.

(D) **Installation**—Construction of flues, combustion chamber (s) and the installation of grates, combustion chamber doors and flue hopper doors shall be in strict accordance with the detailed working drawings furnished by the KERNER INCINERATOR COMPANY.

MODEL-R FOR RESIDENCES OF NOT MORE THAN 6 ROOMS

STANDARD HEIGHT OF INCINERATOR,
5'-11" above basement floor.
FLUE SIZE must be not less than
12"x12". If an additional receiving
door is desired on the second floor,
flue must be at least 16"x16".

Construction Details

Footings for incinerators should extend 6 in. beyond the outer edges of the incinerator walls. Top of footings should be 4 in. below floor level.

In the Models "C" to "O," inclusive, the combustion chamber is built with a 9-in. wall, the inside portion of which is built of fire brick from three courses below the grate level up to and including the inner course of the top. Model "R" does not require fire brick lining—only a first-grade hard burnt common clay brick is needed.

In Models "L," "M" and "P" the combustion chamber is built with 14-in. walls made up of $4\frac{1}{2}$ in. of fire brick on the inside, 8 in. of common brick on the outside, and with $1\frac{1}{2}$ -in. air space between. Method of bonding is shown in construction details. Fire brick shall be laid in fire clay, joints dipped and not buttered.

Flue Construction

Flues measuring 16x16 in. or less shall be en-

closed by common brickwork $3\frac{3}{4}$ in. thick and shall be lined with standard fire clay flue lining.

Flues larger than 16x16 in. shall be enclosed by common brickwork $3\frac{3}{4}$ in. thick with a lining of $4\frac{1}{2}$ in. of fire brick for a distance of not less than 30 ft. above the roof of the combustion chamber; beyond this point, flue enclosing walls shall consist of common brickwork not less than 8 in. thick.

All flues must continue up straight from the combustion chambers to the topmost hopper door, without offsets or slopes of any kind, and shall be finished smooth on the inside.

The chimney top must extend high enough above any roof obstructions to avoid interference with draft. On flat roof buildings, the chimney should clear roof of the building by at least 10 ft. and should clear all obstructions on the roof within 10 ft. of the chimney, by at least 4 ft.

On residences, or other sloping roof construction, the top of the chimney should extend at least 2 ft. above the highest ridge of the roof.

A-Dump grate

F-Dumping lever

MODEL - P UP TO -150- EFFICIENCY APARTMENTS. OTHER APARTMENT BUILDINGS CONTAINING NOT OVER -300- ROOMS IN ALL. HOSPITALS WITH FROM -80- TO -125- BEDS. SCHOOLS WITH FROM -1000- TO -1500- PUPILS.

STANDARD HEIGHT - 7'-7" above basement floor.
BRICK QUANTITIES
3200 common brick - 880 fire brick required.

FLUE SIZE must be not less than 24x24" except for buildings less than seven stories in height, where flue size must be not less than 20x20".

General Information

The Kernerator becomes a permanent part of the building in which it is installed. It should therefore, be incorporated in the building plans to avoid the necessity of later changing the plans and figuring the brickwork for the incinerator as an extra.

Each of the layouts shown has a corresponding detailed installation drawing, which will be furnished together with specifications any time before installation.

The capacities listed for the various models on layouts, Kernerator Pages 3 to 7, inclusive, are as near as can be figured in a general way. If in doubt

about the selection of a suitable model for any particular job, or where requirements are not specifically covered in these layouts, consult the local Kernerator Representative or write to the Home Office.

The incinerators can be placed in any position, using the chimney flue as a pivot, but the relative positions of the fire and ash doors, and the by-pass flue must remain the same as shown. If desired, grates may be dumped from the side opposite that shown.

See text "Construction Details" and "Flue Construction," Kernerator Page 6.

KERNIT INCINERATOR CO.

Portable Gas-Fired Incinerators
MILWAUKEE, WIS.

Products

Two styles of GAS-FIRED PORTABLE INCINERATORS (Kernit with capacities of 3 and 4 bushels, and Kleenburn with capacities of 2 and 3 bushels) to meet the requirements of various conditions, and of all pocket-books. Each in its range represents the utmost for price expended.

Scope of Use

Kernit and Kleenburns, while primarily built for homes, are also suitable for stores, small hospitals, doctors' and dentists' clinics, morticians, banks and other financial institutions, schools, charitable institutions, florists and small stores. They will dispose of all household

LOCAL REPRESENTATIVE

waste, wet and dry garbage, rags, sweepings, papers, etc., and cremate them into pure powdery ash.

Tested and Approved

Kernit and Kleenburn are tested and approved by various testing laboratories, and unconditionally guaranteed by the KERNIT INCINERATOR COMPANY.

Efficient Operation

Kernit and Kleenburn both employ the principle of air drying between burnings which makes for efficient and economical operation—low cost for fuel. Both Kernit and Kleenburn Incinerators are equipped with automatic gas shut-off valve which prevents waste of gas fuel.

Kernit Incinerator

The Kernit Incinerator is recognized as among the best gas-fired incinerators on the market. It has been built up to a standard, and no expense has been spared in its construction. It is most ruggedly built with full cast iron linings, and attractively trimmed with vitreous external sheets. It is the fine incinerator for the finest homes.

KERNIT
INCINERATION

KLEENBURN
INCINERATION

Kleenburn Incinerator

The Kleenburn Incinerator is designed to meet the demand for a popular priced incinerator for domestic use. Its remarkably low price (quality considered) makes it possible now to install gas-fired incineration in nearly every home. Only the best quality of materials are used in its construction, and scientific principles are used in its design.

KELLOGG MANN & CO., INC.

Manufacturers of K-M Incinerators

315 Grote Street, BUFFALO, N. Y.

BRANCH: 551 Fifth Avenue, NEW YORK, N. Y.
DISTRIBUTORS EVERYWHERE

Product

K-M CHIMNEY-FED INCINERATORS, of the built-in, fuelless type, for the disposal of garbage and refuse in residences, apartments, hotels, office buildings, etc.

General Description

The K-M Incinerator consists of a brick combustion chamber of blast furnace design, with fire brick lining. It is located in the basement at the base of the chimney. Refuse is fed into it through a receiving door opening into the flue from the kitchen, pantry or other convenient points on the floors above. (An unlimited number of receiving doors may be used to feed one incinerator.)

Patented Grate Arrangement Speeds Drying and Promotes Strong Draft

The arrangement of the grates in the K-M Incinerator is similar to a suspended basket. The ends of two sustaining pieces B-B (see illustrations below) are embedded in the fire brick sidewalls. The ends of the two pieces A-A interlock into the two sustaining pieces forming a square support for the horizontal grate sections CCC, which form the bottom of the basket, as well as for the bottom of the vertical sides of the basket. Lugs on the bottom of the vertical grates fit snugly into holes in pieces AA and BB. A number of hooks, D, set into the fire brick sidewalls, hold the vertical grates in place at the top.

The vertical grates, or sides of the basket, entirely surround the combustion chamber with the exception of the space occupied by the clean out door. A 2-in. space between these vertical grates and the sidewalls keeps the refuse away from the brick, thus speeding the drying process and permitting the circulation of air and combustion on all sides as well as at the top of the mass.

Separate Sections of Stationary Horizontal Grates

There are either three or four sections CCC depending upon size of incinerator

Section A Fitted into Section B

Typical Double Leaf Fire Door (Open)

Reasons for Unusually Efficient Operation

The satisfactory operation of an incinerator depends upon two things: the rapidity and the thoroughness with which the damp refuse dries out, and speedy, complete combustion. These in turn are dependent upon a satisfactory draft. There are three outstanding reasons why K-M Incinerators insure a maximum draft and hence guarantee unusually efficient waste disposal.

(1) The blast furnace design of the combustion chamber.

(2) The arrangement of the grates holding the refuse away from the sidewalls and forcing the draft from the ash pit up through the center of the mass to the sides and top.

(3) The two-point draft which comes both through the ash pit and clean out doors.

Simple in Design and Foolproof in Operation

K-M Incinerators are simple in design without bearing blocks, nuts, bolts, shakers, handles or moving parts. There is nothing which can possibly get out of order or cause annoyance in operation. Since the grates are of the non-dumping, stationary type, they never give trouble by clogging or warping. The ash pit is always clear, hence providing an unimpeded draft. Ashes and unburnable materials are easily raked out through the fire or clean out door.

K-M Parts Are Few and Simple

The grates are made in simple sections which fit snugly together without the use of nuts, bolts or rivets. They are of the finest quality gray iron of sufficient weight to eliminate the danger of breakage.

Clean out and ash pit doors are of smokeproof construction with interlocking lips and baffle plates. The receiving doors are either of gray iron or aluminum as may be desired. A sturdily constructed spark screen is provided to fit over the top of the flue to prevent sparks, unburned or burning papers, etc., from escaping and becoming a nuisance to the community.

Economical to Install

The cost of K-M Incinerator parts is extremely reasonable. Furthermore, the brickwork is simple and easily erected. The design is such that fewer bricks are required than with most other incinerators. For these reasons, the initial installation cost is less than you have probably been accustomed to figure for incineration.

Seven Models

The seven sizes in which K-M Incinerators are made care for every requirement from the smallest of private residences to the largest of apartment houses.

Guarantee

If the K-M Incinerator, installed according to factory plans and specifications, does not give complete satisfaction, all payments, including freight both ways, will be refunded on the return of the incinerator parts.

Service to Architects

The installation of an incinerator is a specialized subject. In order to assist the architect in selecting the

Typical Cast Iron Receiving Door

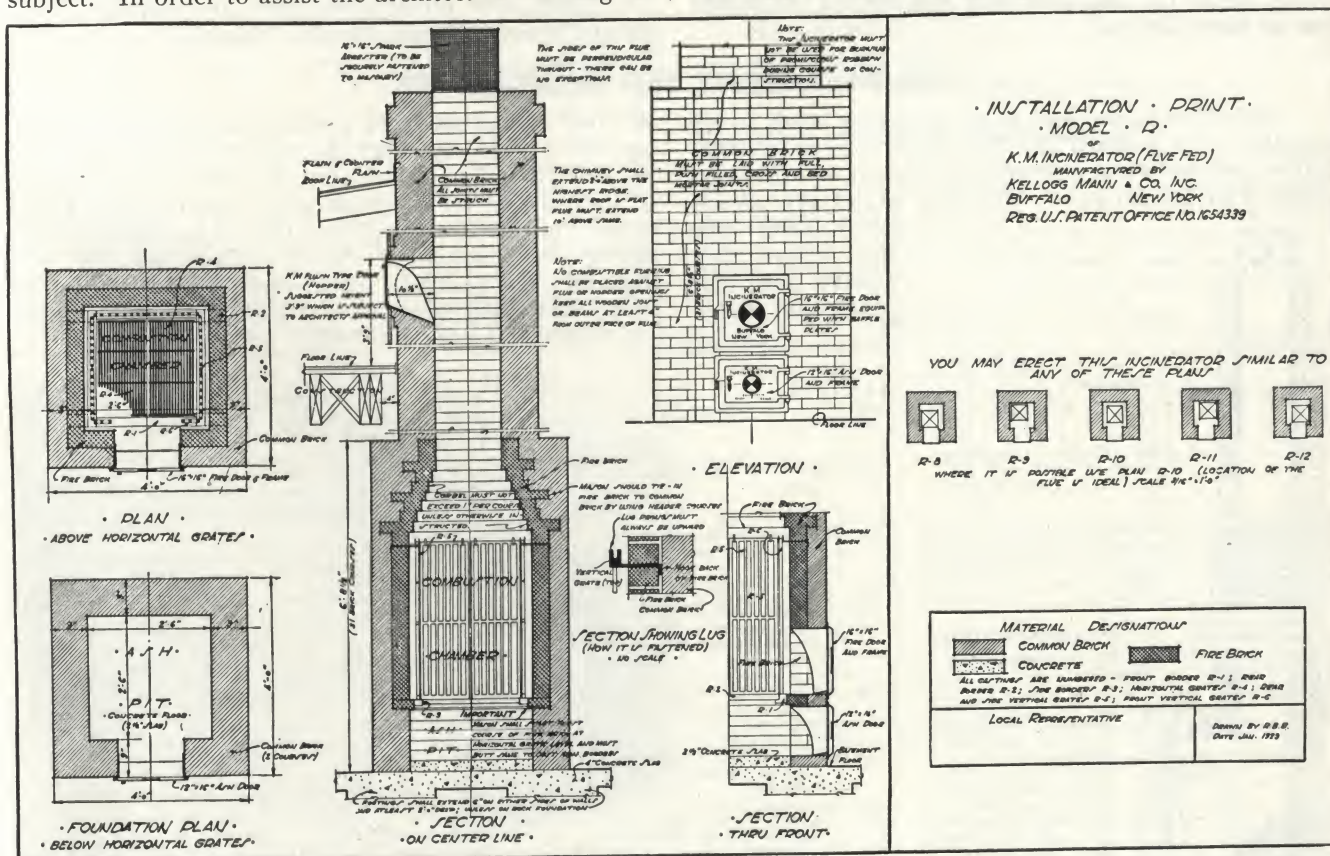

Typical Aluminum Receiving Door (Ship Design)

correct type of incinerator and installing it to insure maximum efficiency and satisfaction, the Kellogg Mann engineering department will gladly study preliminary sketches and plans and recommend the correct flue size and type of incinerator and prepare specifications to insure proper installation. Supervision of the work itself is provided for through the K-M field staff and distributing organizations. There is, of course, no charge for this service.

Typical Specifications (to Be Included Under Masonry)

The contractor shall furnish and install a K-M Incinerator as manufactured by KELLOGG MANN & CO., INC., Buffalo, N. Y. It shall be installed in the basement with receiving door(s) located in the flue at point(s) shown on the plans in accordance with the instructions and detailed drawings furnished by the manufacturer. Spark screen as furnished by the manufacturer shall be installed at the top of the flue.

MID-WEST INCINERATOR CORPORATION

154 East Erie Street, CHICAGO, ILL.

AGENCIES IN ALL PRINCIPAL CITIES

Product

CHUTE FED INCINERATORS for the destruction of combustible wastes from residences, apartment houses, schools and small hospitals.

HEAVY DUTY INCINERATORS for the destruction of combustible wastes in larger quantities in hotels, clubs, hospitals and industrial plants—100 to 3000 lb. per hour. A Mid-West Heavy Duty Incinerator can be built for any kind of reducible material and in any size.

Catalogues and specifications on request.

Technical Staff

The MID-WEST INCINERATOR CORPORATION employs a staff of Combustion Engineers of wide experience. The services of this staff are available gratis to architects, engineers, and others having waste disposal problems.

Installation

Mid-West Chute Fed Incinerators are usually installed by a mason contractor according to plans and specifications furnished by the MID-WEST INCINERATOR CORPORATION.

Mid-West Heavy Duty Incinerators are erected by crews of especially trained incinerator builders employed by the MID-WEST INCINERATOR CORPORATION for this purpose. Each installation is turned over to the owner ready for operation with instructions for proper use of the equipment.

TRADE-MARK

General Description

Mid-West Incinerators of both the Chute Fed and Heavy Duty types employ the step grate principle of grate construction because of the following advantages:

First—Increased burning capacity per unit of incinerator volume, thus reducing the first cost of the installation.

Second—High efficiency and high temperatures because air for combustion is fed to the fire through the fuel bed in the normal and proper manner from beneath the grates.

Third—Increased dehydration of wet material because it comes in direct contact with the incandescent fuel bed.

Fourth—Impossibility of smothering the fire because of the shape of the fuel bed.

Fifth—Impossibility of wet material clogging the air spaces of the grates.

Sixth—Drip-proof grate construction.

Seventh—Assurance of a clean dry ash because all material deposited in the incinerator must pass through a highly incandescent zone before reaching the dump grate.

Eighth—Odorless and smokeless operation because of high temperatures produced by the Mid-West method of combustion.

Ninth—Concentration of stoking and ash cleaning to one set of doors, reducing operating labor to a minimum and increasing sanitation of the incinerator room.

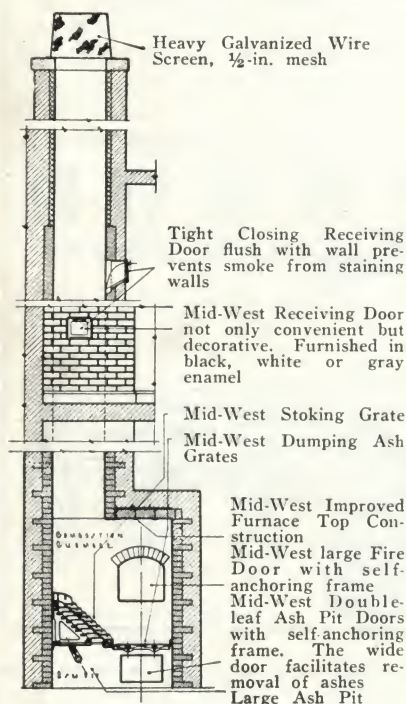

Tenth—All refractories used are standard commercial shapes, always locally obtainable.

MID-WEST CHUTE FED INCINERATORS

Mid-West Chute Fed Incinerators are made in six standard sizes as listed in table. Reference to the illustration will show the general construction of Mid-West Chute Fed Incinerators. The step grates are always placed under the flue where they receive the material and form

the fuel bed properly to produce the maximum burning effect. The shape of the fuel bed is such that the stack draft pulls the fire into the mass of material to be burned and the air passing through the step grates causes this mass to become highly incandescent, producing the maximum drying effect on the wet material. The resulting high temperatures in the incinerator effectively sterilize and deodorize the flue gases.

DIMENSIONS AND CAPACITIES

Ash Pit and Charging Doors

Mid-West ash pit and charging doors can be placed in any convenient wall of the incinerator. They are of pleasing as well as of exceptionally heavy design. The door frames are provided with improved anchorage in the brick work of the incinerator walls, insuring these frames against becoming loose even under the severest handling.

Charging doors are made in three sizes; a 15 in. wide by 12 in. high single leaf door for the smaller incinerators, a 22 in. wide by 20 in. high double leaf door for intermediate sizes, and a 30 in. wide by 25 in. high double leaf door for the large models or for incinerators where special conditions make a very large door desirable. Ash pit doors are 18 in. wide by 12 in. high giving ample room for removal of ash.

Mid-West Intakes

Mid-West vitrified enamel finished intakes meet all requirements for sanitary, attractive and efficient equipment.

The distinctive features of Mid-West refuse intakes are as follows:

First—No screws, bolts, or nuts, because of the patented Mid-West hinge.

Second—Large size.

Third—Recessed door preventing smoke stained walls.

Midwest Intake

Fourth—Rust proof, leak proof bucket eliminating any possibility of moisture stains.

Fifth—Firm, positive anchorage of the frame in the wall, preventing loosening in service.

Sixth—Vitrified enamel finish that will not discolor from heat and is easily cleaned.

Seventh—Intakes do not protrude more than 2 in. from wall.

Suggested Architects' Specifications

The Contractor shall furnish all labor and materials necessary to install (No.) Mid-West Chute Fed Incinerators, model No. () in the location shown on plans.

The incinerator shall be built in strict accordance with the drawings and specifications to be furnished by the MID-WEST INCINERATOR CORPORATION and the intake doors in the flue shall be set in the manner indicated on these drawings.

Incinerator lining shall be high grade fire brick laid in a thin batter of fireclay with brick to brick joints. Thick fireclay joints or fire brick laid with mortar joints will not be permitted.

All work shall be done in a neat and workmanlike manner and all materials used shall be of an approved make.

MID-WEST DESTRUCTOR TYPE INCINERATORS

Advantages

Mid-West Destructors eliminate fire risk; reduce insurance rates; reduce costs of waste and garbage disposal; eliminate waste and garbage storage.

Mid-West Destructors are built of standard commercial brick shapes. *No special fireclay shapes are used.* This feature of design and construction reduces maintenance costs to a minimum, because repairs may be made by any competent brick mason and the necessary brick can be secured easily.

In the design of Mid-West Incinerators proper provisions for expansion and contraction are made in each of the parts. The fuel supporting members are made of material which is universally recognized by the engineering profession as most suitable for the purpose, namely heat resisting cast iron. The design of the grate surface provides for ample cooling of the metal and

permits of free expansion and contraction of the individual members, eliminating warping and cracking.

Should the material to be destroyed demand the use of commercial fuel, Mid-West Destructors may be adapted for use with coal, oil or gas.

Mid-West Destructors are manufactured of any size and for any purpose.

Standard sizes are given in table.

Suggested Architects' Specifications

The Contractor shall furnish Mid-West Destructor(s) Model No. in accordance with plans and specifications on file in the architect's office. The Destructor(s) shall be erected complete ready for operation.

DIMENSIONS AND CAPACITIES

Type	Dimensions				Capacity per hr., lb.	Flue size, in.
	Height, ft. in.	Width, ft. in.	Length, ft. in.	From face of furnace to center line of intake, ft. in.

Types 20 to 27						
20 and 21	8 3	8 0½	7 11½	2 4¼	300	18x18
22 and 23	8 3	12 0½	7 11½	2 4¼	450	20x20
24 and 25	8 3	13 10½	7 11½	2 4¼	600	24x24
26 and 27	8 3	17 10½	7 11½	2 4¼	850	24x30

Types 14 and 16 are two-cell units.

Furnaces Nos. 20, 22, 24, 26 have combustion chamber on right side of furnace chamber; Nos. 21, 23, 25, 27 on left side.
Types 24 and 26 are two-cell units.

Construction of Destructor Fire and Combustion Chambers

MORSE BOULGER DESTRUCTOR COMPANY, INC.

213 East 42nd Street, NEW YORK, N. Y.

AGENCIES IN ALL PRINCIPAL CITIES

Heavy Duty Destructors

Heavy Duty Destructors are built for the sanitary and economical disposal of wastes collected in institutions, industrial and mercantile establishments.

Morse Boulger Destructors are of the brick-set, high temperature type. Destructors are built in standard types and sizes for garbage and rubbish to effect economy in design and construction. Special destructors are designed and built for the incineration of reluctantly combustible or highly inflammable wastes.

Workmanship and Materials

Morse Boulger Destructors are erected by a crew of experienced and skilled mechanics. All materials used

LOCAL REPRESENTATIVE

HEAVY-DUTY INCINERATION MORSE BOULGER DESTRUCTORS

are fabricated especially for use in Morse Boulger equipment, and are designed to withstand hard usage for a long period of time. The steel framing is amply rugged to withstand expansion stresses; the doors and grates are of heavy cast iron; the fire brick lining is made of selected materials specially processed to withstand slagging, spalling, abrasive action and rapid heating and cooling.

Installation

The MORSE BOULGER DESTRUCTOR COMPANY has been designing and building equipment for the disposal of every conceivable type of waste for thirty-five years. Installations have been made in 33 states and in 14 foreign countries and United States possessions.

Garbage Destructors—"G" Type

Designed for the incineration of *garbage*. The garbage is burned on two horizontal sets of fire clay grate-arches; a three-way passage of the hot gases, a hot ash pit, and an adequate combustion and settling chamber are provided.

The fuel grates are of cast iron and are separate from the garbage grates, assuring high temperatures and efficient use of any type of fuel. The design is long and narrow, which results in short spans for roof arches and garbage arches, and makes stoking and ash removal easy.

The three-way passage, with its "over and under" action, insures effective utilization of the heat for rapid drying and burning of the garbage. A long flame travel is secured and combustible gases are thoroughly mixed with air while in the heated zone. This feature enables Morse Boulger Destructors to incinerate wet garbage with no offensive odors or smoke, and with a minimum fuel consumption.

Coal, oil or gas can be used. (Specify kind of fuel, so that details of design are adapted for fuel selected.) Combustible rubbish serves as fuel and frequently is all the fuel that is necessary.

Standard sizes 160 lb. per hour and up, as given in the table on the following page.

Typical Morse Boulger Garbage Destructor—Type "G"

Uses—Especially designed for use in hotels, hospitals, clubs, institutions, etc.

Rubbish Destructors—"R" Type

Designed for the incineration of *combustible rubbish*. All the material is burned on cast iron grates; smoke and combustible gases pass through a checker wall into a large combustion chamber where they mix with air and burn, and where dust and light ashes are settled. Checker work in the combustion chamber prevents funneling of gases into the flue before burning is complete.

The Destructor is especially designed for easy charging of materials, and the most rugged construction is used for durability.

20% of the material being burned may be ordinary garbage. No commercial fuel is required. Operation is without objectionable smoke, and no papers or cinders are discharged from the chimney.

Standard sizes 205 lb. per hour and up, as given in the table on the following page.

Uses—Especially designed for use in office buildings, stores, warehouses, factories, railroad yards, stations, etc.

Typical Morse Boulger Rubbish Destructor—Type "R"

Rubbish-and-Garbage Destructors—"A" Type

Designed for work where both *garbage and combustible rubbish* must be handled in about equal quantities; also for rubbish alone. Garbage is burned on fire clay grate-arches, as in the "G" type. Rubbish is burned on cast iron grates. A large combustion and settling chamber is provided underneath the garbage grate, insuring large space for complete burning of gases and for settling of light ashes and dust. Placing this necessary chamber under garbage grate saves space and conserves heat. Garbage and rubbish are burned with no objectionable smoke or odor and with no discharge of papers or cinders from the chimney.

Under ordinary conditions, this unit operates without any commercial fuel. Garbage alone can be incinerated when necessary (up to 60% of rated capacity) using fuel in place of rubbish.

Standard sizes 125 to 600 lb. per hour, as given in table.

Uses—Especially designed for use in apartment houses, apartment hotels, schools, markets, bakeries, etc.

Typical Morse Boulger Rubbish and Garbage Destructor—Type "A"

ment for medical schools, etc., fume burners for ink plants and paint plants, bond burners and currency burners for destroying cancelled documents under lock and key, and destructors for burning the insulation off copper wire scrap without excessive scaling of the wire and with complete combustion of odors and all smoke.

Morse Boulger Engineers are particularly fitted, by breadth of experience, to deal with special problems.

Capacity Required

Incinerators should be rated in pounds per hour of a specified class of material. Volume means very little, because the unit weight varies between wide limits. Garbage cans vary in size—a can 18x24 in. being nearly twice as large as one 14x22 in.—so that capacity should not be specified in number of garbage cans. If the amount of waste material is not definitely known (as on a new project) a close estimate, based on experience with similar projects, can be made by Morse Boulger Engineers, when furnished with information regarding the size and character of the job under consideration.

Service to Architects and Engineers

Convenient and practical arrangement is just as essential as good equipment. A great number of incineration systems have been laid out and built by Morse Boulger Destructor Engineers, who can often save you time, space, and money if consulted when plans are in sketch state. Inquiries are invited; information will be gladly and promptly furnished.

Suggested Architect's Specifications

The contractor shall furnish one Model No. Type Morse Boulger Destructor in accordance with plans and specifications in the architect's office. The Destructor and related equipment shall be erected in place by THE MORSE BOULGER DESTROYER COMPANY.

Crematories

The Morse Boulger Crematory is of the brick-set, high temperature, direct fire type and consists of two main chambers—an upper chamber for primary combustion and a lower chamber for the combustion of the gases. Cremation is rapid, economical, and odorless. Oil or gas may be used for fuel.

The standard crematory for the incineration of one body is 12 ft. 7 in. long, 6 ft. 4 in. wide, 9 ft. 3 in. high. Other units are built for morgues, medical schools, laboratories, etc.

Special Destructors

Many special destructors have been designed and built for unusual applications and waste materials. Examples of these are crematory retorts for human remains, laboratory equip-

PITTSBURGH BUILT-IN-THE-CHIMNEY INCINERATOR

Construction

The Pittsburgh Incinerator consists of a brick chamber built at the base of the chimney, with a receiving hopper door located in the kitchen on each floor. Heavy grates are used in this system, supported by two horizontal heavy cast iron supports. From one to five dump grates are employed, according to the size of the incinerator. All grates can be removed and replaced through the fire door in the basement.

The incinerator can be located to suit basement conditions, and consists of fire brick lining from the base to the first floor, faced with red brick. Flue lining, according to size of flue, extends upwards from the combustion chamber to top of chimney, with a straight flue to avoid obstructions. A spark screen for top of chimney is securely fastened in accordance with plans and specifications.

Gas-fired

A special gas burner, protected by a specially formed brick, insures complete disposal of all wet, soggy garbage. It is not necessary to dump unburned garbage to the ash pit

and return it to the incinerator for final cremation. The gas is used only in case of emergency, at such times as large quantities of melon rinds, grape fruit rinds or other garbage containing moisture accumulates. Will operate without gas.

Our gas burner is not a mere gas pipe, but a specially constructed burner designed to co-operate with the flue draft, thereby creating a natural air circulation throughout the contents of the chamber and causing immediate combustion. A few minutes use of the gas establishes a body of fire in the chamber, after which the waste matter will continue to burn without the use of other fuel. The waste matter generally consists of garbage, paper, cartons, sweepings, bottles, tin cans, etc. The bottles and tin cans, although not wholly consumed, serve to prevent garbage from packing in the chamber and permit of air circulation through the mass.

In large apartments the percentage of inflammable material is approximately 75% to 25% of moist garbage. The heat generated by the burning of the inflammable matter is ample to dispose of the moist garbage.

A Kitchen Convenience

Receiving hopper ever ready to convey waste matter to the incinerator for cremation.

Hopper No. 1 Daylight opening 8 x 9 in.
Hopper No. 2 Daylight opening 8½ x 12½ in.

Automatic self-closing receiving hopper in kitchen flue; opening to flue interior securely closed during the loading operation, preventing fire and smoke issuing through the hopper door into the kitchen. Strictly in accordance with all fire laws

Standard Incinerator Layouts for Homes, Duplex, or Apartments

Incinerator

The mason contractor shall furnish and install where shown on plans (.....) Model No. (.....) incinerator as manufactured by the PITTSBURGH INCINERATOR COMPANY, Pittsburgh, Pa., with all the necessary incinerator parts complete and in strict accordance with the detailed working drawings and directions as furnished by the manufacturer.

For special designs or requirements, address Superheater and Engineering Co., 103 Park Ave., New York City.

SAN-A-TOR PORTABLE AND WALL TYPE INCINERATORS

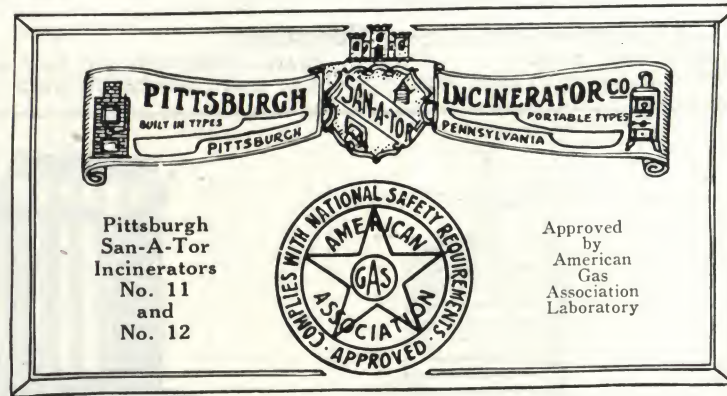

The top, front, doors and base are made of cast iron. The sides and back are made of heavy sheet steel, the interior is of 2-in. fire clay brick; each brick section interlocks one with the other and can be removed and replaced without disturbing any part of the exterior. The grates are supported on cast iron frame with a combustion cone attached to center of rocking grate. Two longitudinal burners, one on each side of grate, convey the gas over the top of the grate, through the mass to be consumed and into the perforated cone, which carries the gas up through the entire mass. This burns the garbage upward and outward from the cone to the sidewalls, thus attacking the mass from all points. Side wing degree grates, one on each side of the cone, allow unburned gases to rise and ignite from gas shooting across the top of the mass from the perforated cone, thus assuring perfect combustion. The burners are protected from the filling up of ashes. The grates are protected from direct gas, hence

the saving of too frequent burning out of grates or any of the cast iron parts of the interior. Grates, cone and all connecting parts interlock and can be removed or replaced through the opening of the door. Gas is fed to the burners through a horizontal frontal tube provided with the main line connections. Ash door and separate ash pan for the removal of ashes are provided. In case it is desired to set

the San-a-tor flush into the wall with automatic ash fall to the basement through chimney, the ash pan is removed, and a door is provided for the cleaning out of the ashes at the bottom of the chimney in the basement.

Method of Installation—San-a-tor as shown in layout, may be installed in several positions, portable or recessed into the chimney wall, known as S. B. Wall Type, removing the ashes via ash pan. S. C. is the same as S. B., except the bottom plate is removed, allowing the ashes to drop to the basement through a flue.

S. D. is installed in the basement and a service hopper is placed in the kitchen. The opening in the top of the incinerator is arranged to accommodate a 13x13-in. flue for the passage of the refuse from the hopper to the incinerator in the basement. This type is made in three sizes, 1, 2 and 5-bushel capacity. All types are lined with 2-in. fire brick, a guarantee of long service, and equipped for the use of natural or artificial gas.

Construction of San-a-Tor No. 4—Five-bushel capacity. Cast iron top, front, base and doors; sheet steel sides and back. Interior is lined with 3-in. benzet fire brick; channel spaced by-passes; grates of the best gray iron in basket formation; two side wing and bottom grates; gas conveying manifold equipped with one burner in rear of each side and one special central burner. All grates are removed and replaced through door opening.

Details of San-a-tor Portable Incinerator Installations

REX INCINERATOR CO., INC.

Manufacturers of Incinerators for Every Purpose

Baker Avenue and Belt Railway, EVANSVILLE, IND.

BRANCHES IN 59 PRINCIPAL CITIES

Products

REXCO CHIMNEY-FED TYPE INCINERATORS, for residences, apartments and institutions, installed at the base of chimney or flue.

REXCO DIRECT-FEED TYPE INCINERATORS, for outdoors or existing structures, using a stack of its own.

Gas burning; optional at very small additional expense.

Features

Rexco Incinerators feature the basket and wing type grate construction, the most modern in incinerator design and construction. Requires less floor space and smaller combustion chamber than the flat grate type. Easy to install, no baffle walls or pockets. Offset feature in grate construction acts as impact breaker or waste distributor, avoiding packing and clogging the grates.

Complete circulation of air on *all* sides insures quick drying and complete combustion. No smoke or odor.

All parts of cast iron or aluminum, no tin or sheet metal.

Furnace and hopper doors of ample size and all-cast. Lasts a lifetime.

Operation

No gas or fuel necessary; will burn all garbage without attention. If *gas burner* is desired, the grate core is drilled and tapped on the underside, and with the hollow gudgeon, makes a practical and simple gas burning incinerator. Simple, safe and sure.

Architects' Specifications

Furnish and install a Rexco Incinerator as shown on the drawings in accordance with the plan and details of the manufacturer, the REX INCINERATOR Co., INC., Evansville, Ind.

Guarantee

Rexco Incinerators are fully guaranteed to do the work and give entire satisfaction when properly installed.

Basket Grate Assembly

C-18 Wing Type
4 to 8 apartments
Floor space 42x46 in.
Price, \$72.00

C-220 Wing Type
20 to 30 apartments
Floor space 60x52 in.
Price, \$98.00

C-430 Wing Type
30 to 50 apartments
Floor space 66x69 in.
Price, \$145.00

C-638
Large apartments and institutions
Floor space 80x72 in. Price, \$195.00

B-14 Residence Type
Floor space 34x32 in. Price, \$65.00

B-215 Basket Type
10 to 20 apartments
Floor space 32x50 in.
Price, \$95.00

B-325 Basket Type
25 to 35 apartments
Floor space 44x50 in. Price, \$115.00

B-14, B-215 and B-325 have basket type grate. Notice offset and full dumping grates and heavy construction.
C-18, C-220, C-430 and C-638 are wing type with sloping hearth, showing full dump grates with wing side grates.
Note: Portholes or vents to insure circulation.

WASHBURN & GRANGER, INC.

Manufacturers of Dean Incinerators and Armored Flooring

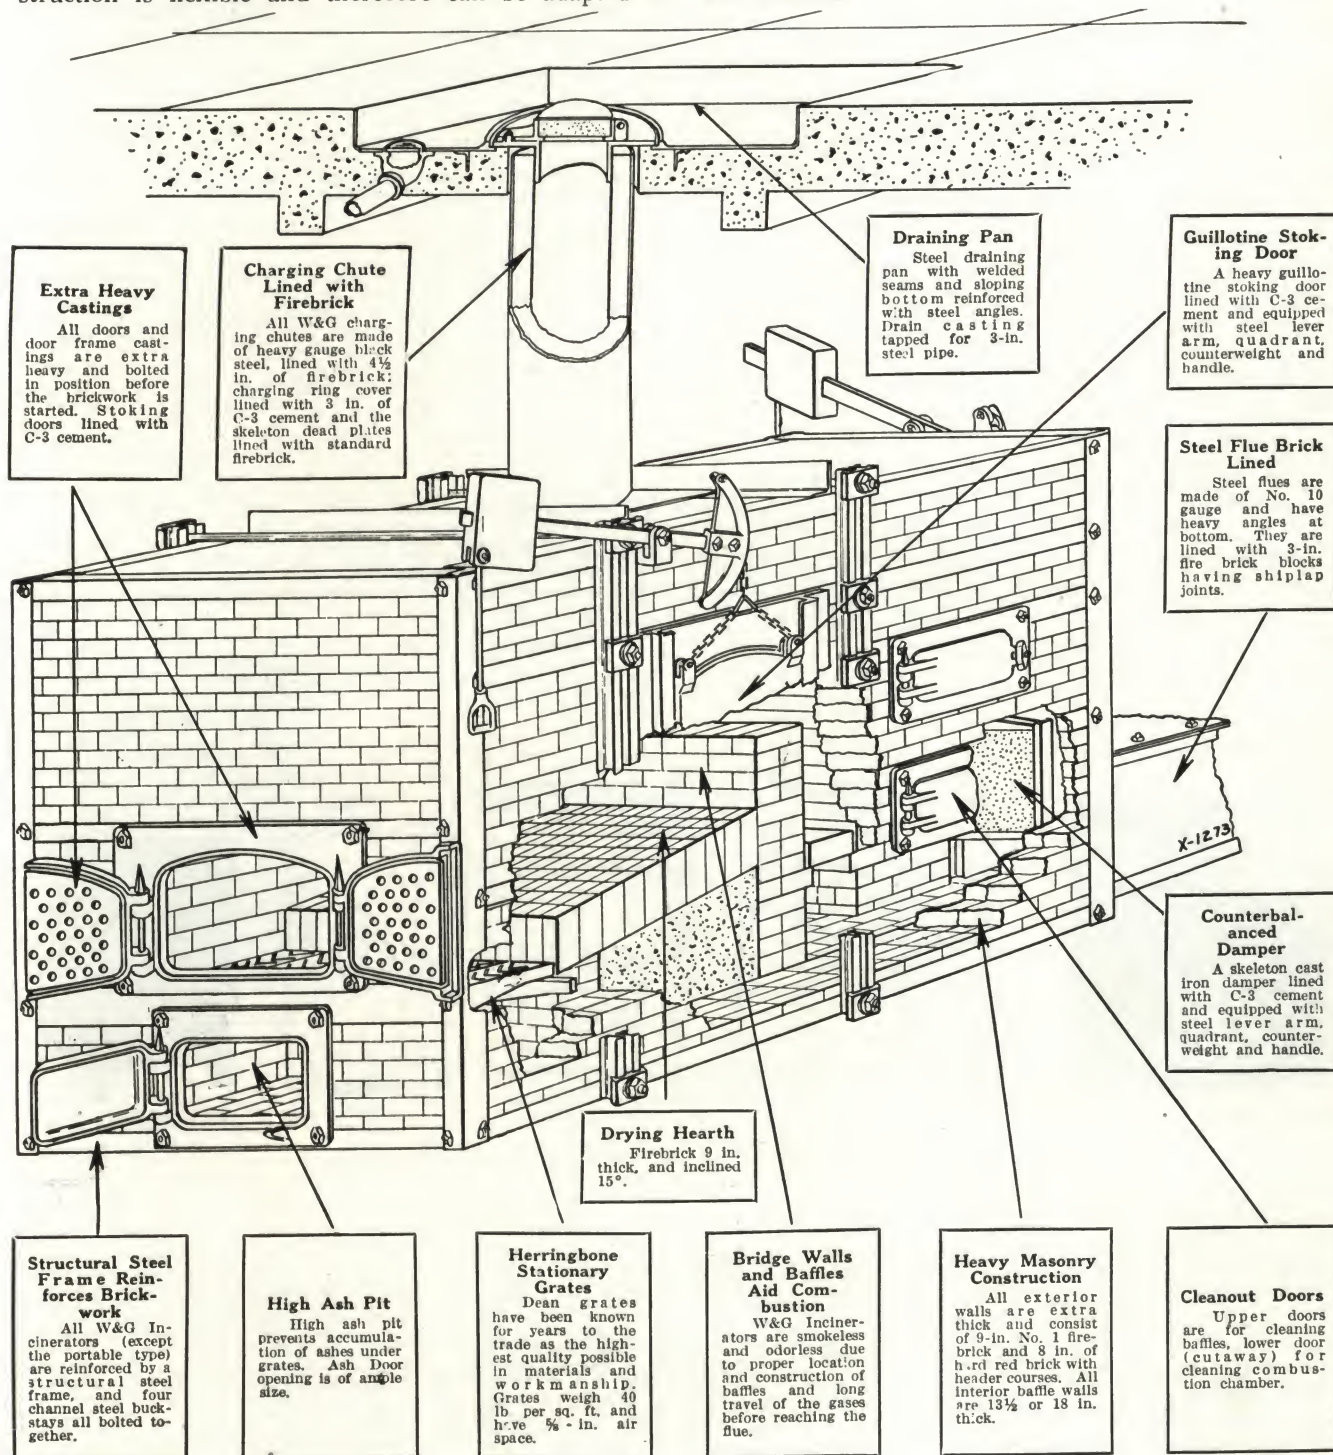

50 Church Street, NEW YORK, N. Y.

FEATURES OF DEAN INCINERATORS WHICH MAKE THEM PREFERRED

A few typical constructional features of Dean Incinerators are shown in the illustration below—proof of their excellent performance in commercial installations everywhere will be furnished on request. But also of importance to the architect in specifying an incinerator is the fact that our construction is flexible and therefore can be adapted to

meet the peculiar requirements of any job. Our long and varied experience covers all classes of incinerator building, and we will design and erect complete, an incinerator guaranteed to do the work required. One quotation covers everything—we assume the undivided responsibility for proper design, manufacture and erection.

DEAN TYPE A INCINERATOR FOR GARBAGE AND REFUSE

Capacities from 100 to 675 lb. per hour of mixed refuse

Designed to incinerate garbage and dry combustible material collected in hotels, hospitals, institutions, restaurants,

railroad stations, produce terminals, markets, etc. Operates with wood, coal, coke, gas or oil.

Specifications

Where space appears in these specifications, supply data and dimensions from table below

General—Furnish all material and labor necessary to complete one Dean Type A (refer to table for size) Incinerator, as manufactured by WASHBURN & GRANGER, INC., 50 Church Street, New York, N. Y.

Foundation—Do all excavation, removing surplus earth from the premises. Install concrete slab of not less than 12 in. in depth and to extend 4 in. beyond exterior walls. These foundations are to be made of one, three and five parts of best portland cement, clean sharp sand and hard durable clean broken stone, screened through 1-in. mesh. All to be mixed and poured in an acceptable manner, and finished level with the floor.

Dimensions and Capacity—The incinerator is to measure ft. in. long x ft. in. wide x ft. in. high. The capacity is to be pounds of mixed refuse per hour.

Steelwork—The incinerator setting is to be reinforced by a structural steel frame, consisting of four vertical corner angles 5x3x $\frac{3}{8}$ in. and four horizontal angles 2 $\frac{1}{2}$ x2 $\frac{1}{2}$ x $\frac{1}{4}$ in. in all four walls of the setting. The entire steel frame is to be bolted together and all door frame castings are to be bolted in position before the brickwork is started. Charging chute shall be No. 12 gauge black steel (refer to "H" in table) outside diameter and of sufficient length to connect the top arch of the incinerator with the floor above. The buckstays shall be four in number each consisting of two 4-in. x 6 $\frac{1}{4}$ -lb. channels placed back to back and held in position with 1-in. diameter tie rods top and bottom. Furnish two 5x3x $\frac{3}{8}$ -in. angles for supporting the charging chute.

Castings—Furnish charging ring with opening (refer to "G" in table) diameter complete with cast iron swing cover fitted with $\frac{1}{8}$ -in. steel plate cover to protect lining. Provide a heavy firing frame with opening (refer to "J" in table) complete with doors and perforated cast iron liners. Provide a heavy ash pit frame with opening (refer to "K" in table) complete with door. Provide a side stoking frame having an opening (refer to "I" in table) complete with guillotine door lined with C-3 cement, steel lever arm, quadrant, bracket, counterweight, and handle. Provide two baffle cleanout frames with doors and cast iron liners and one combustion chamber cleanout door and frame with liner. Furnish inclined skeleton dead plate 17 $\frac{1}{2}$ in. wide, length to suit door opening and with 5-in. pitch. Curved arch plate shall be 17 $\frac{1}{2}$ in. wide, 1 in. thick and length to suit door opening. Also furnish for the stoking door opening a flat skeleton dead plate 18 in. wide x 24 in. long and one curved arch plate 18 in. wide, 1 in. thick, 36 in. long. Furnish herringbone stationary grates in. wide x in. deep, with air space for coal, complete with bearing bars and wall plates. Furnish cast iron base plate for supporting steel charging chute and necessary cast iron tie plates for the buckstays.

Brickwork—On types A1 to A7 inclusive, the front and rear walls shall be 17 $\frac{1}{2}$ in. thick consisting of 9 in. No. 1 fire brick and 8 in. of hard red brick. The side walls shall be 18 in. thick consisting of 9 in. of No. 1 fire brick, 1 in. air space, and 8 in. of hard red brick. On types A8, 9 and 10, all four walls shall be 22 in. thick consisting of 9 in. of No. 1 fire brick, 1 in. air space and 12 in. of hard red brick. In all four walls every sixth course of fire brick shall be a stretcher course with a fire brick header tying the fire brick to the red brick. On the red brick every fourth course shall be a header course. The drying hearth shall

consist of fire brick 9 in. thick and shall have an incline of approximately 15° toward the coal grate. Furnish and set in the baffle chamber opposite the baffle door openings two baffles made of special heat resisting material. Charging chute shall be lined with 4 $\frac{1}{2}$ in. of fire brick, charging ring cover shall be lined with 3 in. of C-3 cement and the skeleton dead plates shall be lined with standard fire brick. Top arch shall be semi-circular and consist of 9-in. standard wedge fire brick, 1-in. air space, 4-in. red brick arch, cinder fill and 1-in. cement finish. All fire brick shall be laid up in high temperature cement.

Damper—Furnish counterbalanced cast iron damper filled with 3 in. of C-3 cement and hung in a 4-in. steel channel guide and provided with steel lever arm, quadrant, bracket, counterweight and handle.

Draining Pan—Furnish a steel draining pan (refer to "P" in table) wide x (refer to "O" in table) long x 4 in. deep at the low point, made of $\frac{1}{8}$ -in. plate with welded seams. Pan to have sloping bottom reinforced with steel angles, and to be fitted with drain casting tapped for 3-in. steel pipe. Furnish 2 $\frac{3}{4}$ -in. globe valve; 1 $\frac{3}{4}$ -in. faucet with hose thread; 12 ft. $\frac{3}{4}$ -in. steam hose; 1 $\frac{3}{4}$ -in. brass hose nozzle. The $\frac{3}{4}$ -in. piping for steam and water valves and the 3-in. drain pipe connection to be installed by other contractors.

Can Washer—Furnish and install one can washer to measure 2 ft. 8 $\frac{1}{4}$ in. wide x 3 ft. 0 in. deep x 4 ft. 0 in. high, base to be of cast iron in one piece with legs to raise it 10 in. above floor line, sides of No. 11 sheet steel reinforced with angles. Door to be hinged type with rubber gasket and locking handles. Furnish brass spray nozzles for upper and lower connections, also special 8x6-in. strainer in base casting. The $\frac{1}{2}$ -in. cold water, $\frac{1}{2}$ -in. steam, $\frac{3}{4}$ -in. hot water, and 4-in. drain connections are to be installed by other contractors.

Stoking Tools—Furnish a set of 3 stoking tools consisting of the following: 1 shovel, 1 hoe, 1 slice bar. Furnish rack for the above tools and install same in a convenient location.

Steel Flue—Approximate length ft. in. Flue shall be rectangular and consist of No. 10 gauge steel sheets reinforced at the bottom corners with 3x3x $\frac{1}{4}$ -in. angles and at the top corners with 1 $\frac{1}{2}$ x1 $\frac{1}{2}$ x $\frac{3}{8}$ -in. angles. The flue shall be lined with 3-in. fire brick blocks having shiplap joints. Asbestos board $\frac{1}{4}$ in. thick shall be placed between the shell and the fire brick lining. Furnish cleanout doors and frames at convenient points for cleaning. Inside dimensions of flue (refer to "E" in table) in. high by (refer to "F" in table) in. wide.

Brick Flue—Approximate length ft. in. Flue shall have 4 $\frac{1}{2}$ -in. fire brick lining backed up with 8 in. of red brick in side walls, 4 in. of red brick over arch and 2 in. of red brick under floor of flue. Flue shall be reinforced with 4-in. x 6 $\frac{1}{4}$ -lb. channel buckstays spaced on 36-in. centers and tied together with $\frac{3}{4}$ -in. diameter rods top and bottom. Furnish cleanout doors and frames for access to flue for cleaning. Inside dimensions of flue (refer to "E" in table) in. high by (refer to "F" in table) in. wide.

Painting—All structural steel shapes and finished castings shall have one coat of shop paint prior to shipment and a second coat of black asphaltum paint on exposed surfaces after completion of the brickwork.

DEAN TYPE D DOMESTIC INCINERATOR FOR RESIDENCES

Specific Requirement

This type of incinerator is designed to incinerate garbage and other waste material which accumulates in private homes of from six to ten rooms.

Dimensions and Capacity—This incinerator is to measure approximately 24 in. in diameter by 5 ft. 3 in. high. Capacity 25 lb. of garbage per hour.

Shipping Data—For domestic shipment the weight is approximately 1,300 lb. For export shipment the gross weight is approximately 1,700 lb. or 772 kilos. Dimensions of case are 30 in. x 30 in. x 6 ft. 0 in., 37.5 cu. ft.

Dean Type D Domestic Incinerator

Complete specifications in Catalog No. 17.

Dean Type E Semi-Portable Incinerator

DEAN TYPE K INCINERATOR FOR SMALL HOMES

This new Dean Type K Incinerator now makes it possible, at very low cost, to eliminate a nuisance and materially increase the sale and rental value of houses in which it is installed. It is as much a sale or rental feature as electric refrigeration, oil heat or the many other conveniences and safeguards to health which the prospective purchaser or owner demands in his house today.

Shipped Assembled—Easily Installed at No Additional Expense

The Dean Type K Incinerator is a heavy cast iron rectangular furnace, correctly designed so that it can be set in the base of the same chimney used for the heating plant. It is shipped assembled and is simply bricked-in by the mason at the time he lays up the chimney—no extra brickwork is required. The same standard sizes of chimney flue tile are used as for the heating plant—the flue tile starts on top of the incinerator and is carried on up the chimney in the usual way. Therefore the actual initial cost of the incinerator is the only cost to be figured.

Specifications

Furnish and install in base of (chimney or chimneys), where indicated on the plans, a Type K Rubbish Incinerator as manufactured by WASHBURN & GRANGER, INC., 50 Church Street, New York, N. Y.

Incinerator shall be a complete assembled unit, built of cast iron throughout, with top arranged to take standard ($8\frac{1}{2} \times 8\frac{1}{2}$ in. or $8\frac{1}{2} \times 13$ in.) outside dimensions, flue tile, and shall

Type K Incinerator Installed in Base of Heating Plant Chimney

be installed as shown on the detail drawings. Chimney brickwork shall be built around three sides of the incinerator according to specifications given under "chimney."

DEAN ARMORED FLOORING

How to Specify

Furnish and set Dean Armored Flooring as made by WASHBURN & GRANGER, INC., 50 Church Street, New York, N. Y., to cover area as per specifications and drawings. Each section to occupy 1 sq. ft. and to be approximately 1 in. thick.

On the rough concrete floor lay a thin bed of 1-to-5 cement and sand mortar. Set each section in this bed so that each piece is level with all others on all sides. After this mortar has set, pour the finish mortar, including cement hardener, over the sections and level off so that cement is flush with top of grids.

Each Section Occupies 1 Sq. Ft. of Floor Space

STEARNS INCINERATOR, INC.

Manufacturers of Garbage Incinerators

SYRACUSE, N. Y.

AGENCIES IN ALL PRINCIPAL CITIES

Garbage and Waste Incinerators

The Incinerite is the pioneer refuse receptacle and destructor for domestic and other uses. All forms of garbage and refuse can be stored in its sanitary chambers, no rehandling. Connected to a flue, it is sanitary and odorless. All waste destroyed and device sterilized by each burning.

The Incinerite is manufactured in both "Portable" and "Built-in" type units that are adaptable for use in residences, apartments, hospitals, schools, stores and institutions. Capacities range from $\frac{5}{8}$ to 68 bu., or from 25 to 500 lb. per hour complete consumption.

Portable Incinerite

Portable Incinerite—This, as shown, is designed for using natural, artificial or gasoline gas, or kerosene for fuel. It is scientifically constructed of gray iron and steel, lined with asbestos and practically indestructible. The gas burner system and the formation of the grates are such that no matter how tightly the wet or dry garbage is packed in the Incinerite the gas combustion is not in the least affected, but always performs its functions perfectly. Dumping grate has interchangeable parts.

Wall Type Incinerite—Usually specified by architects for new buildings, and may be connected with kitchen range flue without decreasing efficiency of flue. Sets within chimney breast with only the face exposed taking up no floor space whatever. It can also be located beside the chimney when several "Wall Type" Incinerites are installed and are using the same flue.

Special Wall Type Incinerite—This Incinerite has a special dumping arrangement for eliminating the taking of the ashes out into the kitchen. This dumping arrangement permits the ashes to be dumped into an ash pit that has been located in the base of the chimney.

Kerosene Oil Model—All Portable Incinerites except No. 1 are furnished to burn kerosene oil instead of gas. Oil from a tank that sits on a pipe support resting on top of the Incinerite flows by gravity action through small tubes (one on each side of machine) to the oil burners.

Scientifically constructed, consists of a brick combustion chamber lined with fire brick built at the base of the chimney.

Draft Controlled—Combined in the construction is an arrangement of grates of heavy design and dumping type; individually set with multiple unit construction. A patented draft control device is constructed on one end of the chamber, with a special hollow wall which allows complete control of the draft while burning.

Duplex Air Circulation, Odorless Surface Burning—A secondary air chamber is provided to assist the primary circulation in assuring maximum drying

PORTABLE
The Incinerite
IT SOLVES THE PROBLEM
TRADE-MARK

Portable Type Incinerite

Burners—So designed that they convert the oil into a gas. There is no attending noise. Flame of gas impinges upon flame spreaders placed directly below grates on which garbage is burned. These machines are furnished at a slight additional cost over gas machines, covering expense of oil tank, tubing and oil burners. Prices furnished on application.

Built-in Type Incinerite

BUILT-IN
The Incinerite

and complete odorless surface combustion of the garbage and waste materials accumulated.

Incinerite Hopper Doors—Are of heavy gray iron castings; made in three sizes, with edges and seats carefully fitted to make them as airtight as possible. They are installed in the flue on the different floors of the building.

Hopper Door

Especially Designed Units—We can furnish the Incinerite especially designed for use in hotels, schools, markets, bakeries, hospitals, institutions, or other miscellaneous buildings.

Our Engineering Department is equipped to deal with special problems.

Architects' Catalogue and Specifications

A complete condensed catalogue of information covering the Incinerite Incinerators will be furnished upon receipt of your request by the home office or local representative.

SKATING RINK SYSTEM

GEO. C. FUNK, PATENTEE

FUNK AND WILCOX CO.

26 Pemberton Square, BOSTON, MASS.

Patents

United States: No. 1,507,592, September 9, 1924; Reissued No. 16,543, February 8, 1927; No. 1,634,938, July 5, 1927.

Canada: No. 280,096, May 15, 1928.

Great Britain: No. 279,025, October 16, 1926; No. 292,623, October 16, 1926.

Patents operated by Funk and Wilcox Co., 26 Pemberton Square, Boston, Mass.

The above-named patents cover construction features in connection with a special skating rink floor and pipe installation, also the process of operating the same, which makes it possible to install a sheet of ice sufficient for public skating or a game of hockey, in a few hours, and remove the same in a few hours. This system makes it possible to use a building for various events from night to night, putting on or taking off a sheet of ice as desired.

Products

SQUASH COURTS; BILLIARD TABLES; BOWLING ALLEYS; SHUFFLE BOARDS.

Also Billiard and Bowling Supplies.

Experience

Our business life covers a period of more than half a century and our products are recognized as having no superiors.

Squash Courts

We are builders of the very finest squash racquet and squash tennis courts, and construct them according to standard regulation requirements. The speed at which these games are played require the construction to be absolutely exact and accurate dimensions must be maintained.

All materials used in the construction of our courts have been carefully selected and seasoned in our special manner.

The finished dimensions of squash racquet courts are 18 ft. 6 in. wide, 32 ft. long. Squash tennis courts measure 17 ft. wide, 32 ft. 6 in. long. The ceiling height should not be less than 16 ft. 8 in. So that the proper ground work can be arranged for, we suggest that you refer to us for plans and specifications.

Billiard Tables

The very best which can be had in billiards is the products which we build. As in fine piano making a large part of the labor on our billiard equipment is "hand work" and accounts for the quality of our tables as compared with the machine made table developed by mass production. We necessarily make fewer tables because of this care which we exercise, but our tables are the best which can be had.

We can offer most attractive designs that we regularly manufacture for the trade, or build tables specially to order to conform with any architectural scheme of the room in which the table is to be used.

These fine tables can be had as billiard, pocket billiard, combination billiard and pocket billiard or subway tables, and a complete playing outfit is supplied with each.

We are prepared to cater to the club, public room or private home.

Standard Trade Sizes—There are four standard sizes: 4 ft. x 8 ft., 4 ft. 6 in. x 9 ft., 5 ft. x 10 ft., 6 ft. x 12 ft. The over-all dimensions of these four sizes are respectively: 4 ft. 8 in. x 8 ft. 6 in., 5 ft. x 9 ft. 2 in., 5 ft. 6 in. x 10 ft. 2 in., 6 ft. 8 in. x 12 ft. 6 in.

The room in which to comfortably place a billiard table should be not less than 10 ft. wider and 10 ft. longer than the standard dimensions given above; additional space would be an advantage for seating space. A 6-ft. space between table and wall is always ideal.

Space Between Tables—The player wants plenty of room for the free use of the cue. The space most desirable between tables is 5 ft., but in some public places this has been reduced to 4 ft.

Bowling Alleys

A.B.C. Regulation—A.B.C. Regulation means that our bowling alleys are built in accordance with the standard dimensions prescribed by the American Bowling Congress which is the governing body of the bowling game. All our alleys are built of the finest comb grain pine and rock maple which is especially seasoned and kiln dried by our own method. Every improvement in the way of construction, such as bed stock being tongued and grooved throughout its entire length, three-piece round gutters, loop style ball returns, Wanda perfect pin spotters are all found in our alleys.

Regulation alleys require a space 83 ft. in length. This provides a space of 16 ft. in front of the foul line called the approach. The widths necessary for regulation alleys are as follows:

2 alley beds with gutters, etc., and one ball return—	11 ft. 6 in.
3 alley beds with gutters, etc., and two ball returns—	17 ft. 6½ in.
4 alley beds with gutters, etc., and two ball returns—	22 ft. 9¼ in.
6 alley beds with gutters, etc., and three ball returns—	34 ft. 3¼ in.

If a greater number of alleys are to be installed, we suggest submitting your proposition to us for arrangement or approval.

Pits—Proper space should be provided for the pits. This space extends the width of the alleys, depending upon the number of them to be installed and is 7 ft. 2 in. wide and 6 in. lower than the rest of the floor at the wall and 8 in. lower than the rest of the floor in the room at a point 4 ft. 2 in. from the wall, and continues for three additional feet at this lower depth on a level until a point 7 ft. 2 in. from the wall has been reached. This provision for pits is only necessary when alleys are to be installed in basements or on street floor level.

Special Improved Subfoundations—When alleys are to be placed on floors above the street floor, we furnish and install subfoundation which reduces noise to a minimum, and as this is a built-up construction, it also provides space for the pits.

Plans—We will supply plans showing the proper regulation arrangement for bowling alleys and details showing arrangement of pits on receipt of your request.

Lighting—Good lighting is a most essential feature, and the best arrangement provides for a fixture hung above the tenpins over the center of each alley bed 8 ft. 6 in. from the wall and the bottom of this fixture should be not less than 3 ft. above alley beds. A series of four additional lights should be placed over the center divisions of each pair of alleys and placed on 12-ft. 8-in. centers. The fixtures over the tenpins should be steel porcelain covered, and the four remaining fixtures above the center division should be white glass domes, 14-in. diameter preferred, and hung so that bottom of fixture will be not less than 9 ft. above alley beds. Our plans show the arrangement of the lights.

Shuffle Boards

We build the very finest shuffle boards, and of materials which have been seasoned in our special manner. These are made in three standard sizes, namely, 24, 28 and 32 ft. These sizes represent the playing surface only and the over-all sizes are 25 ft. 4 in., 29 ft. 4 in. and 33 ft. 4 in. All boards measure 2 ft. 5 in. in width. We can build shuffle boards of any special length required.

Supplies

We are prepared to supply all items of sundry merchandise incidental to the billiard and bowling games, a few of which are:

Billiard—Cloth, cues, cue tips, ivory balls, table covers, triangles, etc.

Bowling—Hard rubber bowling balls, duckpin balls, tenpins, duckpins, mats, finishing materials, etc.

H. A. ROBINSON & CO., INC.

SOLE AMERICAN AGENTS AND CONSTRUCTORS

Fast Drying Tennis Courts

400 Madison Avenue, NEW YORK, N. Y.

TELEPHONE

WICKERSHAM 7695

Products

"EN-TOUT-CAS" and "EN-TOUT-CAS BOUHANA" FAST DRYING TENNIS COURTS.

En-Tout-Cas Co., (Syston) Ltd., Syston, Leicester-

En-Tout-Cas
FAST DRYING TENNIS COURTS

shire, England, sole makers and patentees. Patents—Great Britain, No. 18734; United States, No. 1140241; Canada, No. 156256.

TENNIS FITTINGS and COURT EQUIPMENT.

"En-Tout-Cas" Courts

Description—The material for the surface of this court is made of a special type of clay found in Leicestershire, England. Many complete laboratory tests were made before this type was selected. After the clay is treated by a patent process, in the "En-Tout-Cas" kilns, it becomes the proper texture to permit rapid drying, and not to stain the clothing or tennis balls. It is passed through a fine screen and then laid over a quick draining foundation.

Advantages—Permit play thirty minutes after heavy rain.

Lengthen tennis season by one to two months.

Have red brown or dark green color which contrasts with ball and net. This contrast gives greater visibility and permits twilight play. The color prevents glare.

The color is fast, and the courts are dustless—balls and clothing remain clean.

Require only 4 in. cross fall for drainage.

Have the resiliency of the best turf courts, affording similar bound and footing.

Are equipped with non-trip marking tapes, securely fastened, and beaten flush with the surface of the court. These tapes eliminate trouble and expense of painting the lines more than once or twice a season.

Have great length of life. The original courts constructed in 1912 are still in use. *Indoor* courts are constructed exactly the same.

Construction—All details of "En-Tout-Cas" Con-

struction are managed and supervised by H. A. ROBINSON & Co., INC., after the site has been graded and consolidated.

These specifications cover one standard size court. Details regarding variations in size, and dimensions and quantities for batteries of two or more courts given on application to H. A. ROBINSON & Co., INC.

H. A. Robinson & Co. Inc., Furnishes—

"En-Tout-Cas" Surfacing Material.

Binding liquid.

Court fittings—net posts, net, tapes.

Foreman to supervise construction (includes laying of cinder foundation) and install fittings.

All materials and equipment supplied by H. A. ROBINSON & Co., INC. (when included in contract) delivered f.o.b. the cars nearest freight station.

The foreman gives detailed instruction to the superintendent, groundsman or gardener on the care of the court upon its completion. He also gives a card of instruction, which can be replaced at any time on application to the New York office.

"En-Tout-Cas" Surfacing Material supplied only with complete court installation, and to owners for reconditioning "En-Tout-Cas" Courts.

The Client Furnishes—

A site 60x120 ft. in area, placed north and south.

Turf to be removed from this area.

If present grades are to be maintained, 4½ in. of turf and (or) soil are to be removed.

If soil is of sandy texture a 2-in. layer of clay should be laid on top of foundation; excavation—before laying this clay—should be 6½ in. deep.

No underdrainage is required beneath the court area, except where soil is composed of solid clay, or site is trapped in a low or wet location.

Site must be protected from surface and storm drainage from surrounding lands.

If fill is necessary, it should be thoroughly consolidated and should extend about 2 ft. beyond court area.

The necessary cinders (about 90 tons of first grade locomotive) at, not on, site.

600 bricks for edging and the necessary cement.

Services of 4 common laborers for about 3 weeks.

Such wheelbarrows, rakes, shovels, planking, straightedges, barrel spray pump, etc., as H. A. ROBINSON & Co., INC., foreman may require.

Roller, for construction and maintenance, to be manual, sectional, hollow type, minimum weight 600 lb.

Suitable enclosure.

And installs permanent water supply, with hose connection and automatic lawn sprinkler, for construction of, and care of court. (Direct hose watering will disintegrate surface.)

Hauls all materials supplied by H. A. ROBINSON & Co., INC., from freight station to site.

"En-Tout-Cas" Court Built for William V. Kelly, Lake Forest, Ill.

Match Between Tilden and Cochet on "En-Tout-Cas Bouhana" Courts at Stade Roland Garros, Paris

"En-Tout-Cas Bouhana" Court

Description—The material for the surface of this court is made of a clay imported from France, mixed with red "En-Tout-Cas" material. Produces a fine textured surface, firm and tight, yet resilient.

Advantages—Provides the most accurate playing surface. Is ready for play two hours after heavy rain. This court was chosen for the Challenge Round of the Davis Cup Matches at Stade Roland Garros, Paris, and Hard Court Championships at Rot-Weiss Club, Berlin.

Construction—Built in the same manner as "En-Tout-Cas" except that foundation may be either broken stone or cinders.

Fittings and Equipment

Supplied and recommended after years of experience:

"En-Tout-Cas" Court Fittings—Consists of imported non-rust steel posts, plate and caps to be set in concrete; patent non-ferrous net adjuster and center guide; and compressed lead tapes, which minimize expansion and contraction, beaten flush with surface, nails inset.

Surrounds—It is advisable to have a permanent surround enclosing all hard courts, and particularly for the "En-Tout-Cas" Court, because it is available for play so soon after rain, and it is thus essential to confine the balls to the court, for should the balls reach any surrounding wet grass or soil, they would soon become useless for true and rapid bound. Backstop should be 10 to 12 ft. high.

Binding Liquid—In very dry weather it is desirable that an "En-Tout-Cas" Court be treated occasionally with Binding Liquid. This keeps the court firm, moist, and cool to the feet.

Rollers—Made especially for use on "En-Tout-Cas" Courts—manual, cast iron, machine faced (will not leave ribs), weighs 600 lb., steel bearings, can be handled by one man.

Sprinklers—Water square area 60x60 ft. under high pressure; machine oscillates to direct spray—every inch watered evenly; no waste; mounted on wheels, easy to move.

Court and Tape Brushes—For removing leaves, etc.

Expressions of Appreciation

William T. Tilden 2nd

"I have played on 'En-Tout-Cas' Courts in the United States, England and

CORRECT TENNIS COURT LAYOUT

France, and have found them uniformly satisfactory." Also, "The 'En-Tout-Cas' Court seems almost ideal." From his book "Match Play and the Spin of the Ball."

S. W. Merrihew, Editor of "American Lawn Tennis"

"The most used 'all-weather' courts are the 'En-Tout-Cas' and the 'Bouhana,' so familiar in Great Britain and France.

Early in the present century it was seen that some substitute for grass must be provided, and that led to the evolution of the 'En-Tout-Cas' type of court. Its basic principle was to provide a court that possessed as many of the good qualities of a grass court as possible—such as color, footing, action of the ball—without the bad qualities of the older type."

ALLITH-PROUTY COMPANY

Manufacturers of Stadium Seat Brackets

DANVILLE, ILL.

For our pages on Garage, Airport and Fire Door Hardware, see Manufacturers' Index

Allith Stadium Seat Brackets

(1) Withstand all loads and shocks; (2) economical to install and maintain; (3) standard on the largest stadia; (4) meet every requirement; (5) are permanent; (6) rust resisting.

Type "A" Allith Stadium Seat Bracket—Most universally used on stadia. Top can be furnished in two lengths to accommodate either a 2x8-in. or a 2x10-in. seat plank. Strength of bracket is ample to support heaviest load, yet weight is kept at a minimum. Bracket is bolted to face of the riser leaving tread free of all obstructions, thereby simplifying expensive task of cleaning stadium. This design is much more desirable than tread fastened bracket.

Type "C" Allith Stadium Seat Bracket—Designed for use with three 2x4-in. seat planks, and is recommended when wider seat is desired. Type "C" Bracket is secured to the face of the riser giving a clear tread.

Type "D" Allith Stadium Seat Bracket—Is placed on tread of the riser and accommodates three 2x4-in. seat planks. It is very economical when a tread fastened bracket is used, permanent and satisfactory. Type "D" Bracket does not afford clear tread which is obtained with the use of Types "A" or "C" Brackets.

Type "G" Allith Stadium Seat Bracket—Is adjustable and intended to replace wooden blocks that have warped or split. In such cases original bolts are used to fasten bracket to tread of the riser. It is possible to insert a single bracket without removing entire section of seats. Type "G" Bracket may also be used on new installations of varying riser heights if a tread fastened bracket is desired.

Typical Installation

Type "H" Allith Stadium Seat Bracket—Assembly simplifies installation of brackets and stadium seats. Design is same as Type "A," except one bolt is necessary to hold bracket in place. Two small lugs placed on back of bracket engage in slot of the insert. These lugs keep bracket from rotating while being placed in position preparatory to final adjustment.

Concrete insert of certified malleable iron, giving maximum anchorage, is nailed to inside of concrete forms. Nail slots are located midway between extremities of bolt slot facilitating location of the insert. $\frac{5}{8}$ x2 $\frac{1}{2}$ -in. machine bolt used with assembly has 2-in. vertical adjustment permitting seats to be lined up perfectly in final assembly.

PORETE MANUFACTURING CO.

Manufacturers of Dense and Light Weight Portland Cement Products and
Contractors for Their Erection

346 Riverside Avenue, NEWARK, N. J.

Products

PARTHENON SYSTEM OF PRECAST CONCRETE DECKS for Stadiums, Grandstands and Bleachers.

For our pages on Roofs, Floors and Nailing Concrete, see Manufacturers' Index.

The Parthenon System

Construction—The Parthenon System consists of precast reinforced concrete slabs laid on structural steel beams using felt strips between the two.

Precast Slabs—The precast slabs are bonded together with a tight weatherproof and waterproof joint mastic, which will not crack and which will last as long as the concrete.

Joint Filler—The joint filler forms a solid, tough bond with the concrete and it will not crack on account of contraction. It is a tough viscous material poured hot between the joints of the individual slabs and also between the slabs and the steel beams, bonding the whole construction solidly to form practically a monolithic system.

This makes a permanent fireproof, waterproof and weatherproof slab construction.

Space Under Deck—Can be used for locker rooms, conveniences, concessions, entrances and exits.

Manufacture—These precast units are made in a manufacturing plant protected from weather, with all the details under constant supervision. All slabs are made in accurate steel forms. They are steam cured and protected until the concrete is set. Each unit is inspected before leaving the plant.

Dimensions

Riser—The best riser height for smaller stadiums is 8 in. This gives good visibility and is obtained by use of an 8-in. I-beam. The maximum span for this size I-beam is 18 ft. between the walls. To prevent vibration and sway the beams are anchored at the bearing, and they are stiffened with tie rods.

every 6 ft. Greater riser heights are obtained by using 10 or 12-in. I-beams which are good also for larger spans.

Tread—The tread width should not be less than 24 in. It is better to use a 26 or 28-in. width. Wooden seats can be bolted direct to the concrete slabs. Where chairs are used a tread width of 30 or 32 in. should be used.

Development

The Parthenon System of stadium and bleacher floor construction is the result of years of experience on the part of an expert assisted by a staff of competent men on such work. The design provides an expansion joint of uniform thickness and constant depth, a joint permanently watertight, good looking underneath and good looking on the top.

Economy and Style

This system is lower in cost than monolithic construction, yet has all its advantages. It basically eliminates depreciation caused by frost and moisture, changes of temperature and settlement. It expresses the grace and refinement of the new American architecture.

Erection

The erection is speeded up since the placing of the slab is quickly done. Erection is practicable during the cold winter months as well as in the warmest July.

Service

The PORETE MANUFACTURING COMPANY has its own experienced force to erect the Parthenon System, and for this reason it can guarantee to architects, engineers and owners a first-class construction. Its engineering department is at the disposal of architects and engineers ready to make suggestions for the best methods to employ under ordinary and special conditions.

WATT MANUFACTURING CO., INC.

Manufacturers and Erectors of Gymnasium Bleachers

PITTSBURGH, PA.

Space-saving Gymnasium Bleachers (Patent Applied For)

The bleachers shown in the illustrations were manufactured and erected complete by the WATT MANUFACTURING CO., INC., for the new Clifford B. Connelley Trade School in Pittsburgh, E. B. Lee, architect (Pittsburgh Board of Education). They provide the solution of a problem frequently met in the design of gymnasiums—to make possible the use of the room for several different purposes and at the same time conserve space. The illustrations show the gymnasium installation.

It was desired to provide space for two basket ball courts which could be divided by a folding door and used simultaneously but this did not seem to be practical without using bleachers which would have to be taken down and then set up again when the whole floor was to be used for a game. Not only did this mean a considerable amount of work at each change but also involved the ever-present danger from improperly erected seats.

The problem was solved by constructing the bleachers as if for a permanent installation, but in sections, and then placing rollers under the front bearings and setting guides against the back wall. In this installation, which is about 50 ft. in width, the bleachers were divided into four sections, each of which is equipped with a hoist against the back wall. When lowered into position for use the bleachers extend out into the gymnasium about 16 ft., having nine rows of seats.

When it is necessary to use both basket ball courts the bleachers are raised by the hoists to a position flat against the back wall and then extend into the room only about 2 ft. In this particular installation it was not thought necessary to use counterweights or springs to reduce the weight, as the sections were small enough to be easily raised and lowered. Where conditions require, the construction can be modified or varied to suit.

In some locations it might be desirable to install motor operated equipment with push button control by

which the bleachers may be raised or lowered by pushing a button. The WATT MANUFACTURING CO., INC., offers its fullest co-operation to the architect in working out any bleacher problem.

Construction

The bleachers are sturdily constructed, not only to provide adequate support for the weight of the occupants but to allow an ample factor of safety for the sudden changes in loading and the vibration incident to any condition. The steel supports of plates and angles carry the heavy wood seats and foot rests. The rollers at the front end are roller bearing, thus making for easy handling of the sections. They are of a fibre composition which will not mar the floor.

The guides are attached to the wall as shown and so constructed that, when lowered, the weight of the bleachers and the people is carried on them and not on the hoists. The hoists which provide ample load raising power are hung on plates let into the wall.

Service

Our modern plant is fully equipped to execute any size order and our Engineering and Estimating Department is at the service of the architect and engineer at any time. Typical bleacher details, estimates and suggestions submitted on request. We are also equipped to erect our bleachers anywhere in the United States.

Other Watt Products

In addition to the space-saving bleachers described above the WATT MANUFACTURING CO., INC., has long manufactured stairs of every type and construction. Our stairs meet the requirements of all State and city building codes. Our standard stairs are attractive and can be readily modified to meet the individual requirements of the architect.

We also manufacture the "Wattertite" Sidewalk Door and other steel and cast iron products.

See Manufacturers' Index for our other pages.

Bleachers Lowered

Bleachers Raised

HASBROUCK COMPANY, INC.

Swimming Pool Engineers
Consultants, Engineers and Builders

101 Park Avenue,
NEW YORK, N. Y.

The Swimming Pool Problem

There are five major considerations in connection with a swimming pool:

- (1) *Design* (2) *Construction* (3) *Equipment*
(4) *Maximum sanitation* (5) *Minimum maintenance*

The first three must be exact in every detail in order to produce the last two which are of great importance to the health of those using the pool and to those operating the pool.

The arrangement of the showers and dressing rooms has a direct bearing upon the physical condition of the water in the pool. When we think of a pool it is most important to carefully plan for all showers and dressing rooms and locker rooms, which is part of the service rendered by us.

The A.A.U. and intercollegiate rules pertaining to swimming must be considered if the pool is to be usable for official meets, water polo or other aquatic sports.

The initial cost of a swimming pool is the first thought in the mind of the prospective owner, but relatively this is of less importance than that of sanitation and maintenance, which two latter items, after the completion of the pool, are constantly before the owners and become the major factors for the success or failure of the operation of the swimming pool. A sanitary pool means larger attendance, which in turn produces greater revenue and, if the maintenance cost is low, the net profits are naturally larger.

The above is made possible only through theory, re-

search and experience. We have been for eighteen years actively and exclusively engaged in swimming pool work and we are fully organized and equipped to serve as consultants, engineers and builders of swimming pools. We have our own specially trained men for this work. This places the responsibility under one head for the entire contract.

The swimming pool problem is not a simple one, but rather complex, with the following items to consider which must be properly correlated in order that the final result be successful and that the work may be guaranteed and bonded:

Sanitation	Reinforced concrete
Maintenance	Structural steel tanks
Filtration	Electric arc welding
Sterilization	Heating
Recirculation	Pumps
Ventilation	Motors
Condensation	Painting
Hydrostatic pressure	Special plumbing work
Waterproofing	Springboards
Tile Work	Foot tubs
Ladders	Accessories

Architects are invited to consult with us relative to any type of swimming pool.

If we are awarded the contract to build a swimming pool we make no charge for services rendered. If we are not awarded the contract, we charge a fee for services rendered.

Products and Services

TILE for the Lining of Swimming Pools, Overflow Gutters, Ladders, Floors, etc.

The Furnishing and Application of the proper Waterproofing in connection with the tile application and the essential Metal Strainers, Inlets, Outlets, etc.

For our pages on Ornamental Bronze and Iron Work, Bronze Windows, and Cast Stone Cretan Mantels, see Manufacturers' Index.

Experience, Co-operative Service, and Construction

Our organization, established in 1827, is the pioneer in the development of the tile industry for swimming pools.

In addition to the general service in the study of decorative tile application this organization co-operates with architects and others in the development and study of swimming pool problems, including the correct waterproofing and, if required, will furnish drawings and specifications for the general construction together with estimates for furnishing and installing same.

Jackson Tile Lined Pools

Jackson Swimming Pools, both interior and exterior, installed by our firm, combine either a simple or highly elaborate decorative effect with perfect service-

ability. Our tile is suitable not only for the pool, but for the floor, walls and wainscotings as well, thereby obtaining a most satisfactory unity of effect.

Some of the special features of Jackson Swimming Pools are the Jackson pool life rail, the grip coping, the overflow gutters, depth and distance numerals, safety guides, etc.

We also furnish the necessary metal strainers, inlet, outlet, and floor drains, for which we have many special patterns, and diving boards if required.

Installations

Selection from pools installed by us:

- 59 Y. M. C. A. Buildings
- 11 Y. W. C. A. Buildings
- 39 Private Estates
- 20 Club Buildings
- 18 Community Centers
- 27 Schools and Academies
- 16 Colleges
- 11 Hotels

Bronze Windows

In order to avoid corrosion from dampness, bronze windows are absolutely necessary for natatoriums. See our page on Bronze Windows for information on the "Jackson Patented Window."

Swimming Pool Engineers and Builders

New York Central Building, 230 Park Avenue
NEW YORK, N. Y.

Products and Services

Design, Construction and Equipment of INDOOR and OUTDOOR SWIMMING POOLS, WADING POOLS and ORNAMENTAL GARDEN POOLS.

In addition to complete plans and specifications, our work includes any or all of the following items:

Reinforced Concrete	Tiling
Waterproofing	Pumps
Sterilizers	Heaters
Filters	Inlets
Diving Boards	Outlets
Suction Cleaners	Floor Drains

We are a firm of swimming pool engineers and builders. As engineers, we design indoor and outdoor swimming pools and wading pools. We furnish all the necessary drawings and perform the engineering work for the reinforced concrete and waterproofing. We also lay out all plumbing and mechanical equipment and we write specifications for everything connected with the pool.

As builders, we undertake contracts for swimming pool work complete, or for any portion, such as reinforced concrete, waterproofing, tile, mechanical equipment and accessories. If the contract is awarded to us, we make no charge for our engineering work. If the contract is awarded to others, we charge a regular engineering fee for services.

Designing the Modern Swimming Pool

The rapid growth in the popularity of swimming pools during the last few years has been accompanied by a greater demand for convenience and for sanitary equipment. New systems of filtering, sterilizing, heating and recirculating the water have been developed. The problem of sanitary maintenance has produced changes in the design of the pool itself, while at the same time more attention is being paid to the decorative treatment of the surroundings. As a result of these developments, the work of planning, specifying and build-

ing an up-to-date pool has become increasingly complex.

It has been found that the best solution from the architect's point of view is to consult with an experienced firm of swimming pool engineers. In this way the architect can hold down construction costs, avoid excessive demands on his own time, and insure the construction of a satisfactory, permanent swimming pool.

Tile Is the Accepted Material

Although this Company is prepared to design and construct pools of every type—including tile, faience, cement and enameled brick—we recommend tile pools in almost every instance. Tile has the advantages of sanitation, beauty, permanence and reasonable cost. It has become the accepted material for lining the modern swimming pool.

Sanitary Value—A smooth tile lining has no cracks or crevices where dirt may lodge. Owing to the dense, non-absorbent nature of tile, impurities cannot penetrate beneath the surface, and this insures the thoroughness of the cleaning operation.

Decorative Value—Much more attention is being paid to the element of attractiveness in swimming pools, and especially to the color scheme. For the walls and floors of the pool, white or tinted tile forms the most pleasing and practical ground, but color is used for the swimming lines, depth markers, gutter and curb; also in many cases for the walk and walls surrounding the pool.

Faience panels in special designs are often built into the walls of the pool room. In general, where tile is used for the swimming pool there are unlimited possibilities of decorative treatment.

Permanence—Tile is the most durable of materials. Continuous contact with the water has no effect on its shape, texture or color.

Swimming Pool on Private Estate, Irvington-on-Hudson, N. Y.
This beautiful pool is lined throughout with variegated frostproof faience tile

Swimming Pool in Residence of Walter C. Teagle, East Port Chester, Conn.

Experienced Tile Setters Necessary—To set tile properly requires experienced artisans and superintendents. This Company is widely experienced in tiling work and can execute the most complicated shapes or patterns with complete satisfaction. We can also help the architect by suggesting staple tiles which can be used for their decorative value without adding to the cost of the pool.

Reinforced Concrete and Waterproofing

The thickness and reinforcement of concrete walls and floors in a swimming pool depend on many complicated factors. Among these are capacity of the pool, ground-water pressure, bearing capacity of the soil and when the pool is located in an upper story, vibration of the building and expansion and contraction of supports. It is necessary for best results that the reinforced concrete be designed by an engineer experienced in swimming pool work.

Concrete should be poured in a continuous operation to avoid construction joints.

As for waterproofing, the integral method is generally sufficient for pools at the ground level. Membranous waterproofing is advised for pools in an upper story, on account of its greater elasticity. Consultation with swimming pool engineers is especially recommended in the case of waterproofing work, as their intimate knowledge of the problem will prevent both unnecessary expenditures during construction and the even more expensive failures due to faulty design or execution.

Water Supply

Only a limited amount of water is required for the upkeep of a modern swimming pool. Once the tank is filled, the water is withdrawn, filtered, sterilized and returned to the pool by a continuous process of recirculation. Only enough fresh water need be added to make up for overflow losses.

The rate of recirculation is regulated so that the entire contents of the pool is renovated one or more times a day, depending on the number of bathers. At intervals of several months the pool is drained and refilled.

In some localities the water supply must be specially treated to make it clear and attractive.

Mechanical Equipment and Accessories

The mechanical equipment for an indoor swimming pool consists in general of pumps, heaters, filters, sterilizers and suction cleaners. This Company can furnish and install approved equipment of all these types.

We also furnish and install diving boards, plain or aerating inlets, outlets, and floor drains.

Outdoor Swimming Pools (for Cities, Amusement Parks, Estates and Country Clubs)

The building of outdoor swimming pools is a special branch of the work. Care must be taken with waterproofing to prevent pollution from ground water, and concrete must be designed to resist frost stresses. On the other hand, the omission of heating equipment greatly reduces the construction costs.

Pools for municipalities and amusement parks are generally much larger than indoor pools. Lengths of 150 ft. and more are not exceptional. Circular and oval pools are very popular, and for outdoor work present but little more difficulty than a rectangular pool. Plain concrete lining is the rule.

For estates and country clubs, rectangular pools are the rule. The favorite lining materials for such pools are unglazed vitreous-body tile, ceramic mosaic and faience—all of them strictly frostproof.

A happy variation of the swimming pool is the tiled wading pool for the youngsters. Wading pools should slope to a maximum depth of 1 ft. or less. They can be built at little expense, require no elaborate plumbing and are suited to the smallest grounds.

Special Uses for Swimming Pools

When placed in an elevated position—either on a hillside or in an upper story—swimming pools will serve as tanks for fire protection. This has been done in modern factories and on many country estates.

Country club swimming pools can be drained at night, and the water can be used for sprinkling the golf course and lawns.

Unit Contracts for Swimming Pools

To obtain the best results, the swimming pool should be treated as a unit when apportioning contracts. That is, the entire swimming pool work, including reinforced concrete, waterproofing, tiling, mechanical equipment and accessories, should be let as a single contract. In this way, responsibility for successful results rest on one organization. Preferably the swimming pool contract should be under the direct supervision of the architect and owner.

International Regulation Springboards

Built in compliance with specifications of the National Collegiate Athletic Association and Amateur Athletic Union of the United States. Boards are of carefully selected, vertical straight grain Oregon pine of one piece, thoroughly seasoned and treated. Fittings are best quality galvanized malleable iron, except lower base flanges, which are brass and set flush in walk. Boards fitted with adjustable, rubber covered fulcrum. Designed so the complete apparatus may be readily moved, as the upper flanges are attached to lower floor flanges by cap screws. For either indoor or outdoor pools.

One of the best the market affords.

National Regulation High Springboards Nos. 1528, 1529 and 1530

In order that this board may be correctly installed, the tip of board must be exactly 10 ft. from water level, and as pools are not uniformly built, we must know the distance from the pool walk down to waterline. Vertical ladder is of improved type, using galvanized malleable iron step brackets, upon which are mounted flat, hardwood safety treads.

Nos. 1528 and 1529 High Springboard
(Olympic)

No. 1528—Springboard complete with stand, anchors and all fittings. Board entirely covered with 36-in. safety cocoa matting. Weight about 1000 lb.

No. 1529—Springboard complete with stand, anchors and all fittings. Board furnished with 18-in. strip cocoa matting. Weight about 1000 lb.

No. 1530—Board only, for replacement purpose (matting or fittings not included). Weight about 280 lb.

International Regulation Low Springboards Nos. 1525, 1526 and 1527

To be installed as ruled, tip of board to water level must measure 39 in. It is therefore necessary that we have the measurement from walk level to water line.

Nos. 1525 and 1526 Low Springboard
(Olympic)

No. 1525—Springboard complete with stand, anchors and all fittings. Board entirely covered with 36-in. safety cocoa matting. Weight about 540 lb.

No. 1526—Springboard complete with stand, anchors and all fittings. Board furnished with 18-in. strip cocoa matting. Weight about 535 lb.

No. 1527—Board only for replacement purposes (matting or fittings not included). Weight about 275 lb.

Springboards Nos. 1500, 1505 and 1510

A high grade, first class Springboard; standard size, 22 in. wide, 12 ft. long. Constructed of several boards, selected stock, doweled, battened and fitted to prevent warping. These boards

No. 1500 Springboard

taper from 2 in. at rear to 1½ in. at tip; covered with woven cocoa matting to insure safe footing at all times. All metal parts heavily galvanized; brass stud bolts connect with inset anchors. It is possible to disconnect this springboard by removing these bolts without disturbing anchors as anchors do not stand above the floor surface. No holes in board at fulcrum point; this insures longer life and better action. Shown for concrete or tile installation; made also for planked flooring.

No. 1500—Shipping weight about 325 lb.

No. 1505—Same as shown except for wood plank installation (give thickness of planking when ordering). Weight about 300 lb.

No. 1510—Board only for replacement purposes for No. 1500 and No. 1505 (matting not included). Weight about 140 lb.

Removable Vertical Pool Ladder

Strong and substantial. Riser handrails of tubing, 2 in. inside and 2½ in. outside diameters. Numbers listed below furnished in hot galvanized steel and malleable iron. Regularly furnished with non-slip flat metal safety treads measuring 3x18 in. x ¾ in. thick. Metal treads are superior as a safety measure, present a better appearance and are more comfortable than round rungs.

Anchored only in pool walk, 18 in. from edge; enables lifting of ladders without leaving walk; eliminates breaks in pool wall. Special anchor embedded flush with walk. Ladder measures 22½ in. extreme width, and clears wall 4 ft. Handrails 37 in. high and rest 6 in. in anchor sockets. Two lengths only, for 3 and 5-ft. depths. We can also furnish ladders in polished brass or brass chromium plated and polished, and galvanized steel chromium plated. Approved by leading pool architects and engineers.

No. 1711—3 ft. hot galvanized steel and malleable iron, metal treads, weight about 163 lb.

No. 1713—5 ft. hot galvanized steel and malleable iron, metal treads, weight about 178 lb.

Products

SWIMMING POOL EQUIPMENT.

Josam Inlets for circulating systems; Bronze Lion Heads for main inlet; Josam Hair Catcher; Josam Floor Drains and Main Outlet Drains; Scum Gutter and Multiple Level Scum Gutter and Overflow Drains; Skimmer and Agitator Inlets with either round or square strainers or with fan shape or needle spray spouts, with adjustable connection; Vacuum Connections for cleaning pool.

Instant Steam Water Heaters for circulating systems, for maintaining non-varying water temperature in pool.

All Josam Swimming Pool Equipment furnished either for Durham or soil pipe installation, except Series 2200 E Scum Gutter Drain which is furnished only with threaded outlet.

For other Josam Products such as: Josam Floor, Shower, Urinal and Roof Drains; Backwater Sewer Valves; Open Seat Swing Check Valves; Shock Absorbers; Josam-Marsh Grease, Plaster Sink, Dental, Surgical, Hair and Sediment Interceptors, see Manufacturer's Index.

Materials

Bodies of iron, brass or Everdur. Strainers, spouts, and all exposed parts brass; nickelplated, Chromium plated or polished, or of white metal.

Waterproofing Provision

Josam Swimming Pool Equipment can be furnished with the Josam positive clamping device, affording absolutely watertight connection between drain and wall or floor construction. All Josam Swimming Pool Equipment used below water line of pools should be specified and ordered *without* weep holes and *with* the Josam positive clamping device to hold waterproofing membrane.

Josam Swimming Pool Equipment

Josam Drains with special feature attachments make ideal swimming pool equipment. Josam Swimming Pool Equip-

Series 2242-H
Circulating connection with 4-in. square brass adjustable strainer

Series 590-M
Pool outlet connection with 12-in. brass top

Series 2200-E
All-brass scum gutter drain. Shape conforms to narrow course of the gutter. Threaded outlet. Can be furnished with concave top. A larger size scum gutter drain, primarily for use in large outdoor pools, having a 4x12-in. strainer plate and 3-in. female threaded outlet, is a recent addition to our swimming pool scum gutter drain line. This type is indicated as Type 2253

Series 1200
Combination side and bottom pool outlet connection, with reversible outlet. Angular brass frame and clamping device. Brass removable grate

Series 300
Circulating connection with 4-in. square brass adjustable strainer and collar

Series 310-CV
With threaded brass adjustable connection for vacuum hose

Series 320-CF
With brass adjustable fan shaped inlet connection

Series 580-SB
Pool outlet connection with 8x8-in. square brass grate and 10x10-in. square brass frame, in 2, 3, or 4-in. outlet

Series 530-AB
Pool outlet connection with brass top, 10 or 14-in. diameter grate, in 2, 3, 4, 5, 6, or 8-in. outlet

ment is used in the largest and best public and private indoor and outdoor pools. Body of Josam Type 353C having 3-in. pipe connection is adapted to practically any use for circulating inlets, overflow, vacuum connection, drain of walkway or floor surrounding pool, diving board base, etc., by interchanging type of Josam Strainer or attachment. Bodies with 1½, 2 or 4-in. pipe connection to take fittings above described, can be furnished when so specified and ordered. See Manufacturers' Index for this and other Josam Drains applicable to swimming pool use.

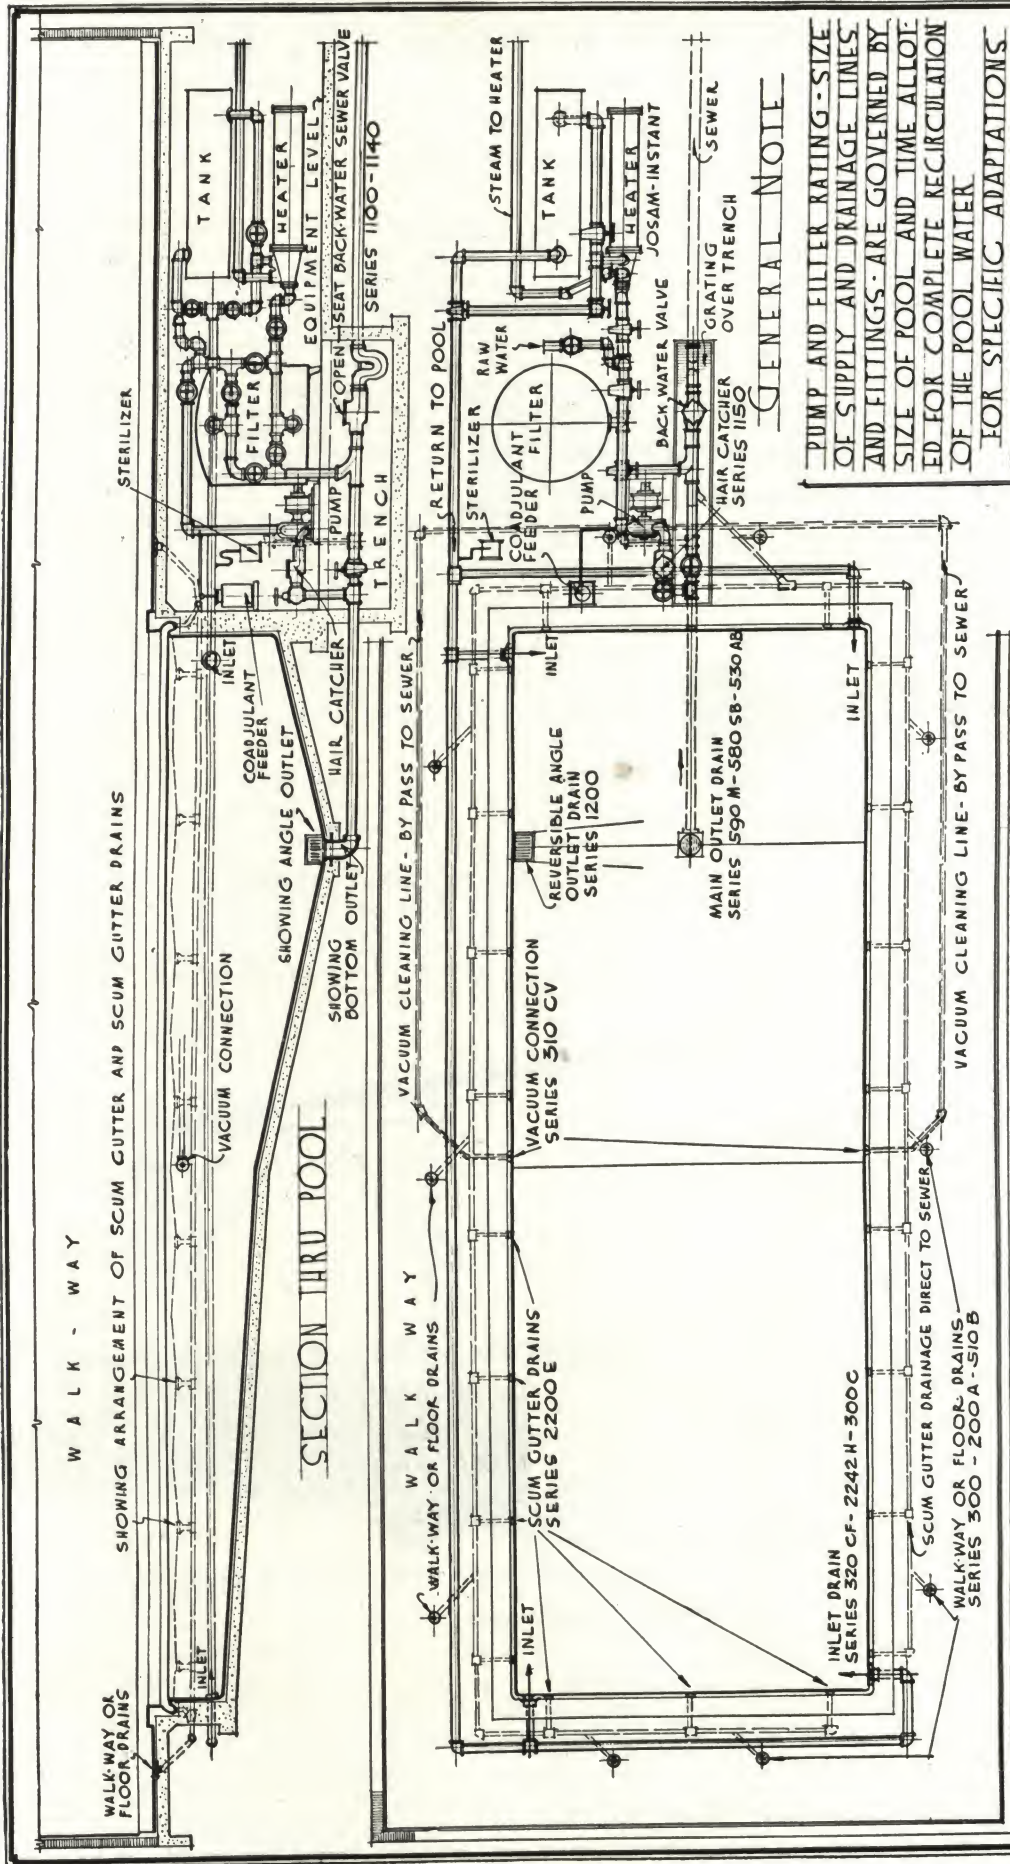

Service, Literature

When requesting information or recommendations consult our Engineering Department at Cleveland, sending sketch of condition to be met. Blue prints and literature on Swimming Pool Equipment will be sent upon request.

VAN ARSDALE-HARRIS LUMBER CO., INC.

SOLE MANUFACTURERS OF

"Brandsten" International and Intercollegiate Regulation Springboard Equipment
Fifth and Brannan Streets, SAN FRANCISCO, CALIF.

Products

"BRANDSTEN" INTERNATIONAL and INTERCOLLEGIATE REGULATION SPRINGBOARDS and DIVING PLATFORMS with adjustable fulcrum equipment for high and low diving.

General Information

The "Brandsten" International and Intercollegiate Regulation Springboard was originated and designed by Ernst Brandsten—director of aquatic sports, Leland Stanford Jr. University, and coach of the American diving and swimming teams at the Olympic Games at Antwerp 1920, Paris 1924 and Amsterdam 1928—in collaboration with Van Arsdale-Harris Lumber Co., Inc.

Description

This springboard is a *one-piece board*, 3 in. thick, 20 in. wide, in 14 and 16-ft. lengths, both of which are official, from strictly clear specially selected vertical grain Douglas fir (*pseudotsuga taxifolia*). This board is not built up or laminated, but is one solid piece. It is tapered to conform to regulations, cleated, bored, oil treated and tested and will not warp, swell or shrink. ("Brandsten" International and Intercollegiate Regulation Springboards installed fifteen years ago are still in use.)

This springboard is official according to the rules of the Amateur Athletic Union of the United States and its affiliates, also the National Intercollegiate Athletic Association, the Federation International De Natation and the Amateur Diving Association of Great Britain. It is the only springboard that was used in the Olympic Games, Antwerp 1920, Paris 1924 and Amsterdam 1928.

General Specifications—Fulcrum Equipment

All fittings are malleable iron except flanges. The upper flanges shall be cast iron standard companion flanges. All lower flanges that are set in concrete shall be of brass. All pipes shall be galvanized. All angular joints shall be screwed with full threads.

Springboard to be dried out before being used and given two coats of pure boiled linseed oil. Coco matting runner to cover board with additional cross-runner at end. The springboard is to be of *selected vertical straight grain Douglas fir in one piece*. "Brandsten" International and Intercollegiate Regulation Springboard as manufactured exclusively by VAN ARSDALE-HARRIS LUMBER CO., INC., San Francisco, Calif.

Service to Architects

Complete working details of plans and specifications of springboard and fulcrum equipment for both the 1-meter height from water line, and diving platform with adjustable fulcrum for the 10-ft. height from water line, will be supplied to architects and engineers upon request without charge.

We also furnish on request, free of charge, drawings of typical contours of swimming pools showing necessary dimensions and designs to meet conditions for indoor (both upper and lower floors) outdoor, high school, athletic clubs, and three-unit systems for universities or municipalities; all designed by Albert C. White, M.E., C.E., world champion diver, Olympic Games, Paris 1924.

The efficiency and consequent popularity of this "Brandsten" Springboard has encouraged others to manufacture springboards and to market them under similar and misleading names in imitation of the name under which we have marketed this "Brandsten" Springboard for many years. We make this fact known in the interest of maintaining the high standard of achievements accomplished on the "Brandsten" International and Intercollegiate Regulation Springboard.

We have no agents or representatives. All units of this equipment carried in stock at our San Francisco plant for immediate shipment.

Catalogue

Write or wire for complete catalogue and detailed drawings covering all official equipment.

Additional Services and Products

VAN ARSDALE-HARRIS LUMBER CO., INC., established in 1888, are lumber technicians. Springboard manufacture is only one of many operations. High grade Pacific coast lumber of every variety and size stocked for immediate delivery.

Products

CHLORINATORS for the Purification of Water, Sewage and Swimming Pools, also for Slime Removal for Paper Mills, Condensers, etc., for Decolorization, Deodorization, Algae Control, Coagulation Control, Oyster Purification, Bottle Washer Purification and other Sanitary and Industrial uses.

COMPLETE SWIMMING POOL RECIRCULATING SYSTEMS.

DRY CHEMICAL FEEDERS for the Application of Alum, Soda Ash, Lime, etc.

AMMONIATORS for the Application of Ammonia in the Purification of Water, Sewage, Swimming Pools, etc.

Also Chlorinating Boats for Bathing Beaches and Reservoirs.

Swimming Pool Chlorination

Sanitation is the most important phase of swimming pool operation. Every bather introduces pollution. Efficient chlorination eliminates the dangers resulting from this pollution. The cost is trifling, only about 5 cents daily for the average swimming pool of 50,000-gal. capacity. Chlorination has been endorsed by the Swimming Pool Committee of the American Public Health Association as the most efficient method.

Chlorination is just as necessary with filtration as without filtration. Its purpose is to destroy harmful bacteria. There is no other known agent that will accomplish this result so efficiently and so inexpensively.

The amount of chlorine required for swimming pools is small. It in no way affects the physical characteristics of the water. The water tastes the same and looks the same after chlorination as before. *Over two thousand swimming pools now use chlorination.*

Water Supply and Sewage Chlorination

Chlorine is universally used in the United States for the sterilization of drinking water supplies. It is applicable not only for water supplies in large cities but also for small supplies, as for institutions, country clubs, estates, etc. A slightly smaller dosage is required than for swimming pools, but the same principles and the same apparatus are used.

Likewise the chlorination of sewage presents the same problem. The use of chlorine in the sewage field is becoming widespread. It is particularly adaptable to small sewage plants, such as those for institutions, hospitals, country estates, country clubs, etc., as the cost in this instance is very low and the chlorine can be used not only as a disinfecting agent but also as a partial oxidizing agent to remove odors and prevent subsequent nuisance.

Paradon Chlorinators

There is a Paradon Chlorinator for every type of swimming pool, water supply and sewage plant. For large water supplies, large outdoor swimming pools, and medium and large capacity sewage plants we recommend the Paradon DB Series chlorinator. For medium capacity water supplies, medium size swimming pools and small capacity sewage plants, our D Series chlorinator is applicable.

The Paradon Chlorinizer is recommended for small water supplies, swimming pools and sewage plants as those of clubs, estates, institutions.

All Paradon Chlorinators are simple and foolproof. They have anywhere from one-third to one-sixth as many parts as any comparable type machine. All parts are sturdily constructed. All parts are easily accessible. They look the part they play—equipment for promoting sanitation.

Industrial Plants and Swimming Pools.*

Over 1400 Paradon Chlorinators in Service

Paradon Chlorinating Scale.

All of our DB and D type chlorinators may be mounted on a platform scale, giving a handsome combined chlorinator and scale in one unit; and the price of the combination is the same as the price of the individual chlorinator and the individual scale.

The Paradon Chlorinizer

The Chlorinizer applies prepared chlorine solution (not compressed chlorine gas). It is designed to meet a heretofore unsolved problem—the chlorination of very small water supplies, as those of estates, country clubs, institutions, schools, etc.

The smaller the flow to be chlorinated, the better adapted is the Chlorinizer. It is also applicable to small swimming pools and small sewage plants.

The Chlorinizer has no moving parts. It is entirely hydraulic in operation. It is ideal for automatic start and stop operation. It can be used for the application of other chemicals in small amounts, as copper sulphate, acids, etc.

The Paradon Portable Chlorinator

The Paradon Type P Portable Chlorinator is a standard Paradon Chlorinator mounted in a handsome fibre carrier. It is in every way interchangeable with a permanent chlorinator yet can be carried around like a piece of hand luggage. Its use is ideal for main sterilization, emergency use, pre-chlorination, as a standby unit for the permanent chlorinator, and any of the score of uses that chlorine is now adaptable to in the field of sanitation.

The Paradon Ammoniator

Ammonia is now being used to aid in the purification of water, especially as regards preventing phenol and other tastes. It permits much larger dosages of chlorine. Accurate control of the ammonia is essential. The Paradon Ammoniator is designed for accurately applying anhydrous ammonia. It is made in a wide range of capacities. It is especially designed for swimming pool purification.

The Paradon Type XL Dry Chemical Feeder

The XL Dry Chemical Feeder is for the application of alum, soda ash, lime, sulphate of iron and other chemicals used in water purification. It is very sturdily constructed and is simple both in design and in operation. It will apply any pulverized chemical or material with extreme accuracy. It has 16 years experience behind it in the design of equipment for the application of dry chemicals.

Specifications for a Typical Paradon Chlorinator

- (1) **Capacity**—The chlorinating apparatus shall have a capacity for chlorinating a rate of flow of (give number) gallons per 24 hours (state whether water, sewage, or what).
- (2) **Details of Construction**—The apparatus shall be mounted on an enameled pedestal. All parts shall be interchangeable. It shall be constructed of materials which will withstand the effects of chlorine gas.
- (3) **Accuracy**—The chlorinator shall be provided with an indicating meter which shall indicate at all times the flow of chlorine to an accuracy of within 4%. The chlorine meter shall be entirely hydraulic in its operation.
- (4) **Guarantee**—The chlorinating apparatus is to be constructed of high class material and first class workmanship. All exposed metal parts shall be polished. The apparatus shall be guaranteed for a period of one year from date of shipment against inherent mechanical defects and the manufacturer shall be required to replace without charge all parts that prove defective within that period.

Service

Our personnel has had many years' experience in the design and construction of chlorinators.

If you have any problem involving the application of chlorine we would be glad to help you solve it, if you will send us the following data:

Maximum rate of flow per 24 hours. Advise if water, sewage or swimming pool. If a swimming pool, merely give approximate capacity of the pool in gallons.

Send for our bulletins, advising if interested in water, sewage or swimming pool chlorination, ammoniators, dry chemical feeders, etc.

Swimming Pool Experience

For over 25 years, leaders in swimming pool development and construction. Creators of the Everson Recirculating System which fulfills all requirements of all National, State and municipal boards of health and assures clear water of drinking purity at all times. Our staff is made up of a co-ordinated group of experts, each a specialist in his phase of swimming pool design, construction and sanitation.

Service to Architects

Advisory and consulting service given to architects without charge or obligation. Detailed information, drawings, specifications and estimates are gladly furnished for complete pools or any part thereof. Feel free to use this service on any contemplated job. Just send us: (1) the capacity of the pool, in gallons, (2) the rate of turnover desired, and (3) space limitations; and we will promptly work out and send you: drawings, detailed specifications and cost information for a Recirculating, Filtering and Sterilizing Equipment that will fulfill the most rigid health requirements. This service is absolutely free to licensed architects and engineers. It obligates you in no way.

How to Use Information in This Catalogue

The mechanical drawing at the bottom of this page, and the typical specification given on Everson page 8, describe the equipment recommended for any 100,000-gal. pool (see plan of typical 100,000-gal. pool on page following). You can quickly figure requirements for proper filtration and sterilization of water in any pool. Units of $\frac{1}{2}$, $1\frac{1}{2}$ and 2 times the capacity of those shown and specified for the typical 100,000-gal. pool are available as standard Everson equipment. Example: for pool of approximately 50,000-gal. capacity, specify an identical system, composed of units, each of one-half the capacity of those specified for 100,000-gal.

pool; for 150,000-gal. pool, multiply capacities of all units by $1\frac{1}{2}$, etc.

Note: If you will send us size and (or) capacity of your prospective pool, we will forward specifications all filled in, with sizes and capacities of equipment to meet Local, State and Government Health Department requirements.

Everson Re-circulating System

The water of the pool is continuously being purified by this system. It is always germ-free and crystal-clear. With this system it is not necessary to shut down the pool every few days for cleaning and replenishing with heated water. This saving alone often pays the cost of the Everson System within a period of one year. The operation of this system is as follows:

Motor driven pumps draw the water from the pool through the "Outlet Fittings" and "Strainer." At this point the sterilizing solution is fed into the line. The pump then forces the sterile water through the "Filters" and "Heater" and back into the pool through the "Inlet Fittings." This method keeps the filter beds always in a sterile condition, preventing bacterial growth in the filters where the sediment is caught.

Filtering Equipment for Pools

The Everson Filtering-Clarifying-Purifying System removes all sediment, keeps water germ-free, crystal-clear and pure. The Everson System is sold complete and installed (as shown at the bottom of this page) or the following units can be bought separately.

Filters	Underwater Lights
Sterilizers	Hair and Lint Catchers
Pumps and Motors	Inlet fittings
Heaters	Main drain fittings
Vacuum Cleaners	Gutter drain fittings
Ozonators	Floor drain fittings
Chlorinators	Aerating Nozzles
Coagulators	Automatic Water Softeners

New Developments and Free Bulletins

The Everson Laboratories and engineers are constantly working out new and better methods and equipment for building and operating swimming pools. At the present time, for example, final working tests are being made on a non-chemical coagulator, on a moderately priced electric ozonator and other revolutionary units and devices. The Jewell Electric Chlorinator (page following) is a typical new Everson product. For twenty-five years Everson has been a leader in the development of equipment and is farther in advance today than ever.

To acquaint architects and pool builders with this new equipment as it is perfected, numerous informative bulletins are issued from time to time. These bulletins are sent free, upon request. That you may keep up-to-the-minute on swimming pool equipment, write and have your name put on the mailing list to receive them as issued—no obligation whatever.

Standard Everson Filtering and Sterilizing System for 100,000-gal. Pool

Continued on next page

Jewell Electric Chlorinator

A new and better method of supplying chlorine to pool water, developed by Wm. M. Jewell, Chief Engineer, Development Branch, Everson Filter Co.

Chlorine is now the most widely used agent for disinfecting swimming pool water. Heretofore, it has been introduced into the system either in the form of a powder, liquid or gas. All of these forms have certain objectional features. The most common practice is the use of drums of chlorine gas, liquefied under extreme pressure, sterilization being effected by applying chlorine gas to the water as it passes from the filter to the pool.

The presence of the high pressure tanks and the activity of this gas, create a constant menace in the danger of gas escapement from drums, valves, or the line. The flow of gas cannot be readily regulated, with accuracy, to meet ever-changing requirements—with the result that pools are frequently understerilized, or are overcharged, which produces an acid condition of the water. Chlorine in drums is comparatively expensive and sources of supply are far between. The extra drum, which must be kept on hand to insure continuous operation, increases the "dead" investment while carting and shipping of drums adds to operation cost.

The Jewell Electric Chlorinator overcomes all of these objections. It consists of a series of electrolytic cells, a saturator, an absorber and a motor generator set, assembled as a single unit in a standard steel cabinet. The sterilizing solution is produced by electro-chemical action in a battery of small cells from common salt and water. The products of this action are pure chlorine gas and a soda solution. The chlorine can be drawn off and used in the usual way where preferred. However, its use with the soda solution is recommended.

Operation under this method is as follows:

The chlorine gas passes to an absorber where it unites with the inflowing water, producing a pure chlorine gas solution which, together with the soda, is continuously delivered to the recirculating system of the pool. The chlorine serves as the sterilizing agent, while the soda solution preserves the alkalinity of the water.

Advantages of This System of Chlorination

(a) *Nothing needed but ordinary salt (rock salt), water and electricity.* There are no expensive chemicals to buy from distant sources. No stock of chemicals to deteriorate.

(b) *No pressure tanks.* None of the dangers that come from storing chlorine. Chlorine is made only as used.

(c) *No disagreeable chlorine tastes or odors.* Water does not become acid and cause smarting eyes and skin.

(d) *Complete sterilization in all parts of the pool.*

Chlorine introduced in this manner retains its germicidal properties in the pool. After bacteria and organic matter are destroyed by oxidation, the only substance remaining in the water is common salt.

(e) *Low operating cost.* The cost of operation, (electricity, salt and water), for the average pool is approximately \$35.00 per year.

Jewell Electric Chlorinator

Patent Applied For
For recommended hook-up see mechanical drawing at bottom of Everson page 1

(f) *Accurate and reliable control.* The amount of chlorine manufactured is definitely determined by the amount of electricity fed to the unit. This is easily and accurately controlled by a rheostat.

(g) *Upkeep cost minimized.* The diaphragms of cells are the only part of the equipment that are "used up." These can be quickly and easily replaced.

Installation Suggestions

When planning for the installation of a Jewell Electric Chlorinator, the following points should be observed in connection with the general layout:

(A) Provide floor drain near proposed location of equipment.

(B) Provide an open air vent above equipment.

(C) An electric outlet of about 5 amperes capacity near by.

(D) A valved 3/4-in. city water service line.

Desirable Location for the Chlorinator

If at all possible, the chlorinator should be located above the level of the pool so that the disinfectant will feed to the pool supply, receiving well or pump suction line by gravity. It should be located in a dry place to insure efficient operation.

For the proper functioning of electrical instruments, dry air is advisable; therefore, if it is necessary to install the chlorinator in the filter room, suitable drains and proper ventilation are prime factors.

It is considered good psychology to place this equipment behind a glass door or window so it can be seen by the patrons of the pool. They will stop and examine any such device which is in sight, and its presence will give added confidence in the sanitary condition of the pool.

If the equipment cannot be located above the level of the pool, it may be placed at any convenient place below the inlet lines. In such case, however, it is necessary to have an ejector connected with a 1/2 in. high pressure city service line.

Specification for Jewell Electric Chlorinator

The contractor shall furnish one Jewell Electric Chlorinator as manufactured by the EVERSON FILTER Co., Chicago.

Equipment to be capable of treating the pool water during circulation at a maximum rate of one part per million of chlorine gas (99 per cent pure) by weight or less as may be required.

The equipment shall include an Electrolytic Cell, gas type; AC to DC Generator Set; Chlorine Absorber; Chlorine Solution Feed Tank; Brine Saturator; Automatic Float and Feed Control.

The equipment is assembled as a complete unit on a framework for installation.

Guarantee

We guarantee the "Jewell" Electric Chlorinator:

To deliver at its outlet, water in a condition of sterility to be acceptable to all local, State and Federal boards of health for drinking (or swimming pool) water; and to maintain a chlorine residue of not less than .2 parts nor more than .5 parts per million parts of water when installed in a recirculation system.

We also guarantee the chlorinator parts for a period of three years' service, and should any parts require replacement, full credit will be allowed pro-rata for unexpired time.

REQUIREMENTS FOR POOLS OF DIFFERENT CAPACITIES

Unit size No.	Pool capacity, gal.	Circulation 8 hr. turnover, gal. per min.	Chlorine production, lb.		Salt reqd. per 8 hr turnover, lb.	A-c., wiring, amp.	D-c., watt hr.
			Per 8 hr.	Per 24 hr.			
1	40,000	85	0.34	1.0	1.5	3	60
2	60,000	125	0.50	1.5	2.0	4	85
3	80,000	170	0.68	2.0	2.5	5	120
4	100,000	210	0.84	2.5	3.5	6	150
5	150,000	312	1.26	3.8	5.0	8	230
6	200,000	416	1.68	5.0	6.8	10	300
7	300,000	625	2.52	7.5	10.0	12	450
8	500,000	1000	4.20	12.6	17.0	20	750
9	750,000	1500	6.30	18.9	25.0	30	1150
10	1,000,000	2000	8.40	25.2	34.0	40	1500
11	1,500,000	3000	12.60	37.8	50.0	60	2250
12	2,000,000	4000	16.80	50.4	67.0	100	3000

Above ratings are based on usual maximum requirements of 8.5 lb. chlorine per million gallons of water or the equivalent to 1 part per million by weight.

Sweet's Underwater Lights

Sweet's Underwater Lights, which were introduced by Everson last year, have revolutionized swimming pool lighting practice. Sweet's Lights, developed by Arthur J. Sweet, internationally known illuminating engineer, are scientifically designed units that fit into the walls of a pool below the water line, and convert the pool water into a mass of non-glaring, non-shimmering, evenly diffused radiance. In a pool so lighted, swimmers appear to be suspended in a flood of light—are always fully visible. Every detail of each swimmer's form and stroke is easily noted and studied from the pool side. Sweet's Lights materially assist swimming instruction and add much to water contests and events and to pool parties. The use of colored globes, caps or lenses adds to the innumerable modern lighting effects these units permit. In many pools they have entirely replaced old-fashioned glaring and shimmering overhead illumination.

Mechanical Features of Sweet's Lights

Sweet's Lights fit into a square, 13 $\frac{3}{4}$ in. opening in the wall at points that will bring the centers of the lights 19 in. below the water line. The frame is of non-tarnishing Cora Metal. Light enters pool through a double glass front—prismed to give even diffusion, at an angle that compensates for refraction. Units are permanently set in the wall, are held by four tie-rods, are water-tight. Adjustable reflector, behind each light, permits directing to compensate for varying depths and contours of pool bottom. Serviced at any time from the rear. Suitable for large or small indoor and outdoor pools.

Specifications Covering Sweet's Underwater Lights

Each Sweet's Unit has a lighting surface of 144 sq. in.; uses only lamps of 1000-hour rating—500, 750

Diagram of Cross Section of Pool, Showing Even Diffusion of Light

Typical Installations of Sweet's Underwater Lights Showing Placement with Different Gutter Contours

Sub-water Illumination at North Shore School of Physical Education—Sweet's Underwater Lights—Evanston, Ill.

Phantom View of Sweet's Underwater Light, Installed

or 1000-watt capacities. The two 12-in. square lenses diffuse the light evenly, projecting a soft, glareless, fan-shaped beam which reaches out toward the other side and sideways until it fuses with the opposite and adjacent beams producing a solid blanket of light.

Sweet's Lights were chosen for the world's largest underwater lighted pool. This installation, requiring 48 units, was made by the EVERSON FILTER Co. at the St. George Hotel Pool, Brooklyn, N. Y.

Installation

Sweet's Underwater Light Units are furnished and installed according to the instructions of the EVERSON FILTER Co. The EVERSON FILTER Co. furnishes forms 13 $\frac{3}{4}$ in. square to be set in the concrete walls before the concrete is poured, in accordance with the plans.

Forms should be left in the concrete walls until tiling of the interior of the pool is completed flush and true with the form. All sides of the opening should be made smooth and true, after the removal of the forms.

Specifications

Standard Specifications for Sweet's Underwater Lights are given on Everson Page 8 of this catalogue—paragraphs 41 to 45, inclusive.

For installations in steel tanks, write for special drawings and specifications.

Note to Architect: While the Standard Specifications for Sweet's Underwater Lights call for units spaced on 5 ft. centers, good results can be obtained even though they are spaced on 10 ft. centers.

Everson Suction Pool Cleaner Tools No. 1071

The Everson Pool Cleaners operate much like the ordinary domestic vacuum cleaners, except that the dirt carrying agent is water instead of air. They are used to remove the sediment which settles on the floor and walls of the pool overnight. The standard Everson Pool Cleaner is designed to operate in connection with a recirculating system but can be used on all types of swimming pools, provided, of course, that motor driven pump be installed. The Everson Pool Cleaner provides the final step in keeping a glistening, absolutely clean pool. It consists of a 15 in. nozzle supported by two rubber tired wheels, a connecting hose and pipe handle. Over the nozzle fits a removable bristle brush which is in contact with the floor while in use. The total length of cleaner and handle is 16 ft.

In planning a swimming pool, provision should be made for installation of cleaner fittings in the pool wall. While the pump of the recirculating system is ordinarily used, dirt drawn through this cleaner should not be piped back through the system, but should be directed to the sewer.

Specifications for Everson (Installed) Pool Cleaner

One Everson Suction Pool Cleaner, complete, No. 1071, polished brass—to include one 50-ft. length special vacuum rubber hose fitted on both ends with swivel hose couplings (No. 692) securely bound with copper wire; one 15 in. suction tool (No. 704) with 36 in. handle having a swivel-T connection to maintain renewable bristle brush (No. 687) squarely on bottom of tank during cleaning operation; one 6-ft. extension handle (No. 691-F) and one 7-ft. handle (No. 691-M) to give total length of 16 ft. to Pool Cleaner; two 2 in. rubber-tired guide wheels (No. 702) to facilitate movement of nozzle

over floor of pool; two Cora Metal wall flanges (No. 693) for 2 in. iron pipe connection.

Everson Portable Pool Cleaners and Tools No. L144 (Without Tools No. L143)

The Everson Portable Pool Cleaner is a complete, self-contained wall and floor cleaning system. It is recommended for pools which were constructed without provision for the standard (installed) Everson Suction Pool Cleaners described opposite. With an Everson Portable, all sediment can be removed from the walls and sides of a pool without draining. It consists of motor and pump, mounted on a truck, connecting hose, nozzle, brush and handle.

Everson Recirculating Fittings

Everson Recirculating Fittings are designed to be built into the pool. Bodies of these fittings are of one piece. Both bodies and face plates are cast of a non-rusting, non-tarnishing, silver-colored alloy—Cora Metal. (Also made of double galvanized cast iron with Cora Metal face plates.)

Designs are carefully worked out to give maximum efficiency with minimum pipe work.

Once installed, Everson Fittings are permanently installed. They are troubleproof, will last the life of the pool.

There are many types and sizes of Everson Fittings, including: inlet fittings, standard and ornamental; floor drains, main drains, gutter drains, cleaner fittings, spray and fountain fittings. Some of the most popular fittings are shown on the following page.

Everson Cora Metal Swimming Pool Fittings

Cora Metal is a non-rusting alloy. It has a deep silver color and takes a high permanent polish. Cora Metal fittings do not tarnish.

If under water the face plates become clouded, the

film will wipe off with a brush of the hand. Cora Metal fittings are cast in one piece with removable face plates, and are made in all practical sizes and shapes.

Everson Swimming Pool Equipment

Everson Equipment adds to the popularity of any swimming pool for each piece is exactly suited to its purpose. You will find this equipment carefully designed, accurately made and of fine materials. It will give long, dependable service. Only the most essential pieces of equipment are shown here.

Diving Board EH-11

Constructed of selected boards, doweled, battened and fitted, dimensions: 12 ft. 0 in. x 22 in., thickness tapered from 2 in. rear to 1½ in. at tip, full cocoa mat covered. Removable, by taking out 4 brass stud bolts. Inset anchors do not project above floor surface. Noiseless "whip up."

**National Collegiate Regulation Diving Board**

Complies with specifications of N. C. A. A. and A. A. U. of U. S. Built of selected vertical straight grained wood, one-piece, 14 ft. 0 in. x 20 in. or 14 ft. 0 in. x 18 in. with strip cocoa mat cover. Taper, from 3 in. at rear to 1½ in. at tip. Fittings, galvanized malleable iron, except lower base flanges, which are brass and set flush in floor. Fitted with adjustable fulcrum. Entire apparatus readily removed.

**Improved Regulation 10 ft. 0 in. High Diving Board Stand EH-15**

Complies with specifications of N. C. A. A. and A. A. U. of U. S. Built of selected vertical straight grained wood, one piece. Tapers from 3 in. at rear to 1½ in. at tip, 16 ft. 0 in. long, by 20 in. wide or 18 in. strip cocoa mat covered. Stand built of steel pipe and malleable iron, all heavily galvanized. Ladder of improved type with hardwood safety treads. Entire apparatus easily removed, intact. Properly installed, tip of board is exactly 10 ft. 0 in. above water.

**Natorium Slides EH-1-2-3**

For either indoor or outdoor use. Stairs and chute sides of selected hardwood, all else of heavily galvanized steel. Provision for bolting to concrete, tile or wood flooring.

**DIMENSIONS OF NATATORIUM SLIDES**

Chute length, ft.	Platform height, ft.	Outside width of chute, in.	Over-all length, ft.	Extreme width, ft.
15	7	22	18	4
24	12	22	28	6
30	15	22	35	10

Swimming Pool Ladders SP-20

Substantially built with 1½ in. pipe risers and wall anchors. Treads of cast Cora Metal, broad with rounded edges, supported full length. Guards rise 36 in. above edge of pool. Risers 4 in. from pool side. Anchors imbedded 6 in. in concrete or tile. Treads, 3x18x¾ in. Extreme width of ladder, 22 in. Metal parts, either all brass or all galvanized steel, as desired. Specified according to water depth, for depths of 4, 5, 6, 7, 8, and 9 ft.

**Rescue Pole EC-35**

A rescue pole should be included in the safety equipment of every pool. The EC-35 is light, strong; has a galvanized shepherd hook securely fastened to a 14 ft. spruce pole. For safety's sake, include one of these poles in every pool's equipment.

**Life Buoy EH-30**

It's sound insurance to have a few life buoys in full view in every pool. This buoy is made of sheet cork, is exceptionally strong and safe. Outside diameter, 30 in.

AUTOMATIC WATER SOFTENER HOF-107

Plumbing Specifications Covering All Mechanical Equipment for 30 ft. by 75 ft. Swimming Pool (100,000 Gal. Capacity, 8-Hour Turnover)

Note: If you will send size and (or) capacity of your prospective pool, we will forward specifications all filled in, with sizes and capacities of equipment to meet local, State and Government health department requirements.

General—(1) The following specifications cover the equipment and material required for properly delivering, recirculating, filtering, heating, sterilizing and draining the water supply of a 30x75-ft. pool.

(2) This Contractor shall refer to the plans and note the location of all equipment, drains, valves and various fittings, which are covered by these specifications.

(3) The architect reserves the right to make such changes in the location of equipment or material, as may improve the system without adding material cost.

Drawings, Guarantees and Supervision—(4) This Contractor hereby agrees that the various pieces of equipment comprising this swimming pool system, namely the hair and lint catcher, the recirculating pump and motor, the filters, the heater, the sterilizer, the vacuum pool cleaner and special fittings shall be furnished by one manufacturer, as EVERSON FILTER CO., 647 No. Green Street, Chicago, Ill. This manufacturer must be willing to furnishing the drawings indicating runs of pipe, location of equipment, valves and fittings and also manner of connection. Also, this manufacturing company must guarantee that all pieces of equipment furnished are of proper capacity and design to co-ordinate one with the other, and that if this equipment is installed according to its layouts, and operated according to its instructions, the water in the pool will be kept bright and clear, free from turbidity and of a degree of purity acceptable to the State Board of Health.

Filters—(5) This Contractor shall furnish and install, as indicated on plans, three 66-in. diameter vertical pressure filters, complete with supports, piping, valves and fittings, strainers, filter beds, coagulant pot, pressure gauges, sight glasses, air relief cocks, etc. The combined capacity of these filters shall be 213.6 gal. per minute when operating at the rate of filtration of 3 gal. per sq. ft. of filter area per minute. These filters shall be equal to Everson's Type "O" Filters.

(6) The filter tanks shall be built with dished heads, suitable to withstand a test pressure of 100 lb. per sq. in. Each tank shall be provided with a sufficient number of legs or supports that will be suitable for the size and weight of the filters. An 11x15-in. manhole shall be located in the top head of each tank. All pipe connections shall be fitted with steel threaded flanges.

(7) In and near the bottom of each tank a strainer manifold shall be provided over the entire diametrical area. This manifold shall consist of a pipe header and laterals, tapped to receive the proper number of strainer valves.

(8) Non-clogging strainer valves shall be furnished. Each valve shall consist of a slotted cylinder with silver alloy top and bottom plates, secured with three tie-bolts, all to be nickel plated. Each bottom plate shall have an outlet hub with ½-in. external pipe thread.

(9) The filtering material shall be white, machine-cut quartz crystals, selected and screened to uniform sizes best adapted for filtering requirements. Each grain shall have sharp irregular edges which most effectively catch all suspended matter carried by water. The total depth of the filter beds shall be no less than 36 in.

(10) The operating manifold shall be compact and located conveniently at the front of the filters and shall consist of standard gate valves and galvanized pipe and fittings. The operating manifold shall have unfiltered water inlet and filtered water outlet connections. It shall be properly valved and so connected that the flow of incoming water may be directed either downward or upward through the filter beds, and it shall also provide for discharging either filtered water or wash water to the drain.

(11) Sight glasses shall be provided for the water line, to permit observation during the back-washing period of the waste or filtered waters. A test cock for sampling filtered water shall be provided on each filter. Standard pressure gauges, indicating up to 100 lb., shall be provided to show pressure loss during filtration. One gauge shall be located on the inlet and one on the filtered water outlet of each filter. A brass air relief cock shall be located on the top of each filter to permit free exit of air.

(12) One cast iron pot with removable lid shall be provided for feeding the coagulant. It shall be provided with brass pipe lines for connecting to the inlet water pipe. These brass pipe lines shall be provided with brass valves and an adjusting cock with graduated dial, in such a manner that the coagulant solution may be fed at any desired uniform rate to the water on the way to the filters. The coagulant pot shall be provided with a brass blow-off cock and a suitable support.

Vacuum Sediment Remover—(13) This Contractor shall furnish and install an Everson No. 107 Brass Vacuum Cleaner, which shall consist of one 50-ft. length of special wire woven vacuum rubber hose, fitted on both ends with swivel hose couplings, one 15-in. suction tool, one 36-in. handle, having a swivel-T connection to maintain removable bristle brush squarely on bottom of tank during cleaning operation, one 6-ft. extension handle and one 7-ft. extension handle (to give a total length of 16 ft. to the sediment remover), two 2-in. rubber tired guide wheels to facilitate movement of nozzle over floor of pool and one wall flange for 2-in. iron pipe connection.

Hair and Lint Catcher—(14) This Contractor shall furnish and install in the suction line of the pump, a 4-in. Everson Duplex S-63 Hair and Lint Catcher complete with two strainer baskets and a compound vacuum and pressure gauge.

Recirculating Pump, Motor and Starter—(15) This Contractor shall furnish and install on concrete foundation, where indicated on plans, one manually controlled swimming pool recirculating pump, having a capacity of 213 g.p.m. when discharging against a head of 50 ft., including friction with suction pressure figured at zero. The pump shall be a double suction, single stage, horizontal split centrifugal pump, having a solid bronze shaft, enclosed brass impeller and oil lubricated removable ball bearings. It shall be mounted on a heavy cast iron sub-base, and direct connected by a flexible coupling to an electric motor.

(16) The electric motor shall be a General Electric, Westinghouse or Howell 5-hp., 40°, phase, cycle, volt, C. motor, operating at a speed of 1720 r.p.m., capable of running continuously without undue heating, sparking or sign of overload.

(17) The motor shall be complete with a push button starter providing overload phase failure and no-voltage protections.

Pool Cleaner Pump, Motor, Starter, and Hair Catcher—(17-A) This Contractor must furnish and install a pump, motor, starter and hair and lint catcher in connection with the Vacuum Pool Cleaner. Capacity of pump 100 g.p.m. against a 20-ft. head, designed for a suction lift of 10 ft. For further details, consult manufacturer of the vacuum pool cleaning equipment.

Heater—(18) This Contractor shall furnish and install one Instantaneous Type Steam Operated Swimming Pool Heater, having a capacity of 12,000 g.p.h., from 40° to 80° F., when supplied with steam at atmospheric pressure. The shell, water chamber and heads shall be close grain cast iron of the best commercial grade; the heating section of seamless drawn copper tubing securely expanded into the tube heads. The heater shall be suitable for a working pressure of 15 lb. on the shell side and 100 lb. on the tube side. The heater shall be furnished with cast iron cradle supports and the necessary flanges for steam, condensation, water and drain connections.

"Jewell" Electric Sterilizer—(19) This Contractor shall furnish one No. 3 "Jewell" Electric Sterilizer, having a capacity of 2 lb. of chlorine gas per 24 hours, applied as sodium hypochlorite solution, to the suction side of the recirculating pump, or equivalent to one part of pure chlorine gas per million parts of water. This equipment shall be furnished complete with operating panel board, including control instruments, automatic cut-out switch, automatic feed, float control, and orthotoludin water testing outfit. Electrical contractor shall run wires to starting switch as required for a ¼-hp. motor.

Chlorinator—(Alterate for "Jewell" Electric Sterilizer)—(20) This Contractor shall furnish one chlorinator for dispensing chlorine gas into the water during the period of circulation. This chlorinator shall be furnished complete with all accessories required for proper operation, including 100-lb. cylinder of chlorine gas and orthotoludin testing outfit.

(21) Such type of chlorinator or sterilizer as may be selected by the architect as most suitable for the particular installation, shall be installed in strict accordance with the manufacturer's drawings.

Main Pool Drain—For Pool Outlet—(22) This Contractor shall furnish and install at the lowest point equidistant from the center line of the pool, two 6-in. Everson No. 894 Main Drain Fittings with galvanized cast iron body and solid nickel alloy polished strainer (6x14½-in.) plate.

Recirculating Fittings—Water Inlets for Pool—(23) This Contractor shall furnish and install four 2½-in. Everson No. 877 Galvanized Cast Iron Inlet Fittings with solid nickel alloy polished strainer (3x9-in.) plates, two shall be set in the wall at the deep end of the pool 18 in. below water line, and two shall be similarly set in the shallow end.

Gutter Drain Fittings—For Pool Spill-over—(24) This Contractor shall furnish and install twenty 2-in. Everson No. 693 Gutter Drain Fittings, seven on each side and three at each end, equally spaced. These fittings shall have galvanized cast iron bodies and solid nickel alloy polished strainer (2x8-in.) plates.

Floor Drain Fittings—Around Pool Walk—(25) This Contractor shall furnish and install twenty 2½-in. Everson No. 900-D Floor Drain Fittings, seven on each side and three at each end, equally spaced. These fittings shall have galvanized cast iron bodies and solid nickel alloy polished strainer (3x9-in.) plates.

Vacuum Cleaner Connection—(26) This Contractor shall furnish and install two Everson No. 896 Vacuum Sediment Remover Wall Flange Extensions, which shall be located as indicated on plans and 8 in. below the water line.

Spray Nozzles—(27) In shallow end of pool install two No. 714 Everson Spray or Skimming Nozzles which are to be located in end wall about 2 in. above overflow line. Set face plate flush with finished wall, each nozzle to be separate valved and connected to a 2-in. supply pipe from filters.

Connecting Lines, By-passes, Etc.—(28) Run a 4-in. valved line from pump discharge to inlet of filters.

(29) From the outlet of filters, run a 4-in. valved line to heater inlet.

(30) From the outlet of heater, run a 4-in. supply line to inlet fittings in each end of the pool. This line may be reduced to 2½ in. as it branches to supply each fitting. This line must be valved so that the incoming water can be shut off as desired, from either end of the pool.

(31) Provide valved by-pass around filters and also around heater.

(32) Provide discharge connections to drain from pump and filters.

(33) Provide discharge connection from heater trap to drain or return line.

(34) From main drain of pool, run a 6-in. line to storm drain or main sewer. At a convenient place in this line, install a 6-in. valve. From a point in front of this valve, run a 4-in. valved branch line and connect to inlet of hair and lint catcher at the pump suction.

(35) From the wall flange connections of the vacuum sediment remover, run a 2½-in. valved line to inlet of hair and lint catcher at the pump suction.

(36) Connect a 4-in. valved city water line to inlet of hair and lint catcher on pump suction.

(37) Connect the floor and gutter drain into the same discharge line and connect the discharge line properly trapped into either storm drain or main sewer.

Painting—(38) All piping, valves, fittings and equipment shall be given two coats of approved paint, if not otherwise protected against corrosion.

Electrical Connections—(39) This Contractor shall make electrical connection from pump motor to the starter, from where electrical contractor will make final connections.

Steam Connections—(40) The heating contractor shall furnish and install all steam lines to and from heater, and connect same into main steam system; the lines to be properly valved and trapped.

Specifications Governing Sweet's Underwater Lights—(41) The various units of this system as manufactured by the EVERSON FILTER CO., Chicago, Ill., are to be furnished and installed as follows:

General Contractor—(42) Shall provide in the pool walls as many openings (each 13¾ in. square), as are shown on the plans, and in each of these, shall furnish and install Sweet's cast, polished, Cora Metal Frames, Type No. 612-S. These frames shall be fitted with a special non-shattering glass, and the contractor must guarantee to make both frames and glass watertight. Contractor may secure complete drawings and details of this installation from the above manufacturer.

Electrical Contractor—(43) Is to furnish a No. 613-S Portable Lighting Unit as manufactured by the EVERSON FILTER CO., Chicago, fitted with 500-watt No. G40 floodlight bulb, reflector, bracket, socket, receptacle, and 3 ft. of cord with plug on each end, this unit to be set in the opening provided by the general contractor. The plug on one end is to be connected with the portable lighting unit, and, for the purpose of reaching the service line, on the other end to a Hart & Hagemann No. 1430 receptacle with No. 1710 plate fitted into Gem B box.

(44) A separate circuit must be provided for each unit.

(45) The electrical contractor shall also furnish and install 12-in. square concentrating lens No. SMO as furnished by the EVERSON FILTER CO., Chicago, Ill.

MARSH ELECTRO CHLORINATION COMPANY, INC.

ASHLAND 5777

101 Park Avenue
NEW YORK, N. Y.

PERFECT SANITATION OF SWIMMING POOLS

Perfect sanitation of swimming pools requires not only that sterilized water be delivered to the pool, but that it be kept sterilized by adding a persistent disinfecting medium to the water. Chlorination is the universally accepted effective method for accomplishing this result, and as such is approved by all public health authorities.

However, there are other requirements, in addition to the above, which must be met before perfect sanitation can be obtained by the chlorination process.

The oxidizing agent must be neutral to assure absolutely non-irritating and pleasant sterilized water. In addition, it must be inexpensive to operate and the dosage must be accurately supplied and controlled.

Every one of these essential requirements is fully met by the Marsh System of Electro Chlorination.

Neutral Disinfection with the Marsh System of Electro Chlorination

The Marsh System provides the safest, most effective and most desirable form of chlorination. It produces a powerful yet neutral (non-irritant) oxidizing solution, sodium hypochlorite, a product similar to Dakin's solution, and delivers it to the water in accurately controlled doses.

How the System Operates—

The basis of the system is the Marsh Electrolytic Cell, similar in appearance to an ordinary dry cell, combined with special pyrex and hard

rubber manifolds for salt solution feed, chlorine outlet from cells and absorber coils.

By passing an electric current and brine through the Marsh Cell the most efficient form of chlorine, sodium hypochlorite, is produced from common salt solution uniformly and in the quantities desired.

The amount of chlorine dosage delivered is absolutely controlled by the charging current of electricity at the control panel. The chlorine is absorbed in the electrolytic soda and water solution, stabilized and then diluted automatically before it enters the swimming pool circulating system.

Important Advantages of the Marsh System

Provides complete and uniform sterilization in every part of pool.

Control is accurate, dependable and convenient because it is operated by electricity.

Operates on alternating or direct current.

No commodity to buy but salt. Simple and easy to install.

Eliminates extra cost for protection in handling and storing hazardous chemicals.

Filtration is improved.

Eliminates outlay for expensive prepared solutions.

Inexpensive to operate.

No irritating and unpleasant conditions in the water.

Has long life because all parts are non-corrodible.

Apparatus is kept new and accurate by inexpensive renewals of Marsh cells.

Complete Marsh Equipment

Including a battery of Marsh Cells with pyrex manifold, chlorine outlet, electrolytic soda solution feed and absorber coils, battery charger, electrical control board, upper tank containing salt and water for brine feed to cells, middle tank containing soda solution from cells for feed to absorber coils, and lower tank receiving electrolytic sodium hypochlorite solution from the absorber coils for delivery to pool or storage for sanitary uses.

OTHER USES FOR MARSH SYSTEM

Marsh equipment provides convenient and effective means of supplying solutions for many other purposes as follows:

Hospitals: Highest quality of antiseptic and disinfectant solutions.

Laundries: Neutral electrolytic bleaching solution protects fabrics with reduction of cost in most cases.

Water supplies: Most effective and pleasant form of sterilization.

Sewage problems: Stabilized chlorine solutions produce better results.

Deodorization: For comfort stations in bathing houses, etc.

Country estates, stock farms, dairies: An incomparable disinfectant at the lowest cost.

Note: The finest and purest soda and bleaching solutions can be made for use in textile, paper and industrial plants.

Note: For outdoor pools and heavy bathing loads chlorinators of larger capacity are recommended.

Co-operative Service

We will be glad to co-operate with architects and engineers in furnishing them with suggestions as to the proper application of the Marsh System to any water purification requirement, as well as to submit quotations, specifications, and other information desired.

Short Specification for Swimming Pools

Contractors to furnish and install in accordance with manufacturer's directions, one Marsh Electro Chlorinator, manufactured by the MARSH ELECTRO CHLORINATION COMPANY, Inc., 101 Park Avenue, New York, N. Y., of sufficient capacity to provide sterilization by available chlorine dosage in the form of non-irritant (neutral) electrolytic sodium hypochlorite solution.

Installation Suggestions

The following points are of importance when planning an installation of the Marsh System.

- (1) Floor drain under the Marsh Equipment.
- (2) Air vent when a closet or small room is arranged for equipment.
- (3) Electric outlet near equipment and wiring to control board and to cells.
- (4) 1/2-in. city water connection near equipment and four 1/4-in. branch lines with valves to electro chlorinator and for wash spray and 1/2-in. valved branch to ejector.
- (5) A 1/2-in. Penberthy XL-96 Series 82 Hydraulic Ejector connected to high pressure city water service to feed solution into the pool or to recirculation line after filtration.

WIDE SCOPE OF INSTALLATIONS BUILT UP ON SUPERIOR MERIT

The Marsh Electro Chlorinator has been installed over a period of years in every type, size and kind of swimming pool for universities, hotels, hospitals and clubs, and in private pools. Each year finds a larger number installed than the year before. More and more architects and engineers recognize that here is a quality equipment offering the most desirable features of a sterilizing apparatus and yet successfully surmounting disadvantages that have become accepted simply because no one had been able to overcome them.

Architects and engineers can be assured that by specifying a Marsh Electro Chlorinator they are stressing quality and effectiveness of results, the use of modern convenience of electrical control with its ease and simplicity of operation, its dependable accuracy, and above all, pleasantness and non-irritation. They can be assured also that the owner obtains the best at reasonable initial cost, and operating, maintenance and depreciation cost which will keep his overhead at a minimum, year in and year out.

ROBERTS FILTER MANUFACTURING CO.

Swimming Pool Recirculation Systems

638 Columbia Avenue
DARBY, PA.

For our pages on Filters, Filtration Plants and Appliances, see List of Manufacturers

Swimming Pool Sanitation

Recirculation has completely solved the question of swimming pool sanitation. It is mandatory under State Board of Health regulations in many states. With recirculation the water is drawn from the deep end of the pool by a centrifugal pump and returned through filters and sterilizing equipment and in the case of indoor pools, through a heater to the shallow end of the pool.

A typical recirculating plant for indoor pools is shown below, but each large outdoor pool should be given separate study so that the arrange-

ing greater capacity, a recirculating period of 12 hours can be employed. The rate of filtration should preferably be 3 gallons per square foot of filtering area per minute, but in no case should it exceed 4 gallons per minute per square foot.

Co-operation

Our Engineering Department is at the service of architects and engineers engaged in the design, construction, or maintenance of swimming pools. We welcome every opportunity of co-operation. Write for our "Swimming

Swimming Pools

To serve the purpose for which they are intended, and to provide a means for healthful exercise and recreation—must be maintained in a satisfactory sanitary condition.

Regardless of the purity of the water supplied to the pool, contamination—often of a dangerous nature—is constantly being introduced from the body and mouth rinsings of the bathers. This contamination cannot be avoided. With chlorination, however, it can be overcome.

An essential requirement in swimming pool sterilization is a means to counteract immediately such contamination as is introduced into the pool. The residual sterilizing action, peculiar to chlorination alone, is such an effective means. Through the addition of a minute quantity of chlorine to the water supplied to the pool, the residual germicidal or disinfecting action is carried on at all points and the purity of the water in the pool assured at all times, regardless of any variations in the bathing load.

W & T
Chlorinator
Type MSV

Chlorination

Chlorination is universally recognized as the most effective and economical method of swimming pool water sterilization. It has received the unqualified endorsement of public health authorities and sanitary engineers throughout the country.

"From all available information, the addition of chlorine . . . by the use of proper apparatus, is today the most satisfactory method of swimming pool disinfection."

So states the report of the Joint Committee of the Sanitary Engineers Conference and the American Public Health Engineering Section of the A.P.H.A.

This sweeping endorsement of chlorination is based on a study of swimming pool control, extending over a period of eight years or more, by prominent authorities charged with the safeguarding of public health and is concrete evidence of chlorination's efficacy.

While economic reasons often dictate the use of a recirculation system, chlorination is essential, regardless of what means are used to replenish the pool water supply.

W & T apparatus is the product of the oldest and most experienced manufacturers of chlorine control

Swim in
Drinking
Water

equipment in the world. It is the same type of equipment as is now in daily service sterilizing drinking water on over 10,000 installations. Obviously, any process that will make water safe to drink will make it safe to swim in.

W. & T Chlorine Control Equipment

Solution feed, MSP or MSV, chlorinators are generally recognized as being the best equipment for larger pools, both indoor and outdoor. In this equipment chlorine is accurately administered as a solution of chlorine and water, with all the advantages of complete and rapid diffusion into the pool water.

For the smaller pool, the W & T chloro-clock, a device for the accurate measuring and feeding of a previously prepared sodium hypochlorite solution, is particularly adapted.

The W & T electrolytic cell is recommended for such installations as those where it is preferred to generate the actual disinfecting agent, chlorine, as needed.

All apparatus is guaranteed against inherent mechanical defects for a period of one year from date of shipment. Every piece of equipment is thoroughly tested under actual operating conditions before leaving our factory.

Outstanding features of W & T apparatus are dependability, long life, low maintenance and low operating cost.

Service

An extensive field staff of technically trained engineers is available to co-operate with architects and designing engineers in the solution of their problems and the selection of the proper type of chlorine control equipment and for consultation on any features entering into the design, construction and operation of swimming pools, without cost or obligation.

Technical publications dealing with the specific application of individual types of equipment will be gladly furnished on request.

Nearly 2500 swimming pools throughout the country are now being chlorinated with W & T equipment. The water in these pools conforms to the requirements of the local and national health authorities in all respects and continued satisfactory operation of all equipment is the direct responsibility of a nationwide service organization.

BILLIARD TABLES, BOWLING ALLEYS, SQUASH COURTS and SHUFFLE BOARDS.

For our pages on Toilet Seats, see Manufacturers' Index.

Real Billiard Tables for the Home

Brunswick Tables are known all over the world, and are the standard wherever billiards is known. Professional championship games for many years have been played on Brunswick Tables. The same manufacturing facilities that produce these professional tables are devoted to the production of the table that we make for the home.

Every Brunswick Home Table is a real billiard table, regardless of size. The only difference between Brunswick Home Tables and Brunswick Regulation Size Tables is in the area of the playing surface. But inasmuch as the cushions, cushion angles and the size of the balls have been reduced in the same mathematical proportions as the playing surface, the scientific playing qualities of the smaller tables are identically the same as those of the larger type.

Desirable Locations in the Home—The most desirable location for a home billiard table is on the first floor and, if possible, the billiard room should join the dining room, as billiards is a splendid after-meal exercise. In many of the better English homes it is the custom to so locate billiard rooms.

First Floor Plan
Scale: $\frac{1}{8}$ in. = 3 ft.

There is much enjoyment to be derived from the game of billiards after dinner, or with neighbors or friends at a later hour, and, for this reason, it is essential that the table be located most conveniently and most accessibly.

Since the development of oil burners, many of the smaller houses are providing basement billiard rooms in space no longer needed for coal bins, large cumbersome furnaces, etc.

Brunswick "Home Club" Table

We have developed a convertible home billiard table which is ideal for dining room or living room use.

The "Home Club" Table is the latest development of the craftsmans' art in the construction of beautiful furniture. Attractively designed in American walnut, this table completely meets the requirements of the exacting housewife for the dining or living room.

The dining or living room table top is removable, which immediately converts it into a real billiard table, with all the pleasures of carom or pocket billiards available. A disappearing accessory drawer contains playing equipment and keeps it out of sight when not in use. A disappearing ball rack which can also be swung under the table is placed opposite equipment drawer.

The "Home Club" table has been created for those

"Home Club"—Dining or Living Room Table

homes and apartments where a special room is not available. The present floor space may be utilized for this table, which can be purchased at a cost but little exceeding that of a dining or living room table of attractive design.

Complete with all playing equipment.

Furnished in Two Styles and Two Sizes—The "Home Club" table is available in two styles; either as a pocket billiard table, or as a combination table for playing both carom and pocket billiards on the same table.

TABLE AND ROOM DIMENSIONS "HOME CLUB"

Table size	Room size, not less than
3 x 6 ft.	11x14 ft.
3½ x 7 ft.	12x15 ft.

Combination Table with Interchangeable Cushions—The combination feature is achieved through the use of two sets of cushions, one for carom billiards and a set for pocket billiards. They are quickly and easily interchanged by the mere opening and closing of hand levers under the rails which lock either set firmly in place. A box is furnished to hold the set of cushions not in use.

Brunswick "Junior Grand" Table

The "Junior Grand" is designed along lines especially appropriate for the home having a room or other space available for billiards, amusements, den or recreation room. It is attractively designed and made in two-tone American walnut with vein line ornamentation and hand rubbed finish.

Furnished in Two Styles and Three Sizes—Table is available in two styles similar to the "Home Club" table for pocket billiards or as a combination table for playing both carom and pocket billiards.

Equipped with disappearing accessory and ball rack drawers similar to the "Home Club" table, complete playing equipment furnished.

"Junior Grand"
Sizes: 3x6, 3½x7 or 4x8 ft.

TABLE AND ROOM DIMENSIONS "JUNIOR GRAND"

Table size	Room size, not less than
3 x 6 ft.	11x14 ft.
3½ x 7 ft.	12x15 ft.
4 x 8 ft.	13x17 ft.

Brunswick "Grand" Table

The "Grand" is especially designed for homes having a room suited to the use of a billiard table of full regulation size.

It is built of highly figured butt walnut, two-tone finish, and decorated with vein line ornamentation on frame, rails and legs. It is a true billiard table in every sense, which means the height of achievement in fine cabinet work and playing standards.

Furnished in Three Styles and One Size—Table is available in three styles: as a carom billiard table, as a pocket billiard table, or as a combination carom and pocket billiard table with convertible rails.

Equipped with disappearing accessory and ball rack drawers. When the table is not in use, all billiard playing equipment is entirely out of sight. Regulation playing equipment furnished.

TABLE AND ROOM DIMENSIONS "GRAND"

Table size	Room size, not less than
4½ x 9 ft.	14½ x 18 ft.

Modern Recreation Clubs or Centers and Commercial Establishments

As a result of our extensive and varied experience we have been able to develop and maintain a thoroughly trained organization, who have made a special study of the requirements of the modern recreation centers and will gladly, without charge, co-operate with architects who have such a problem on their boards.

For commercial establishments or recreation centers, upper floors or basements may be utilized to advantage for billiard rooms and bowling alleys.

The modern tendency is to build recreation clubs or centers consisting of two, three or more stories. The floor plans shown on Plate 2 (third page following) are simply offered as suggestions of arrangement and are sufficiently flexible to permit of such changes as may be necessary to utilize floor space available. They give a fair idea of the floor areas required to accommodate the equipment and concessions found in two of the largest recreation clubs, now operating.

Basement space can be used to good advantage for additional bowling alleys, swimming pool, baths, or other attractions, if desired. Some of the newer buildings have provided ideal bowling quarters in this space. The ceilings, of course, should be of sufficient height to give proper ventilation.

If a new building is to be constructed, consideration might well be given to the English type of basement or semibasement. This reduces the amount of excavation required and permits of windows—a feature which adds immensely to the lighting and ventilating of the space.

Trade Table Sizes and Dimensions—The following table gives the dimensions of the four sizes of tables manufactured for the trade:

TRADE TABLE SIZES AND DIMENSIONS

Trade sizes	Actual measurements between extreme outside edges of opposite rails
4 x 8 ft.	4 ft. 7½ in. x 8 ft. 5½ in.
4½ x 9 ft.	4 ft. 11½ in. x 9 ft. 1½ in.
5 x 10 ft.	5 ft. 5½ in. x 10 ft. 1½ in.
6 x 12 ft.	6 ft. 8 in. x 12 ft. 5½ in.

Space Between Tables and from Walls—Between tables, 5 ft. is best; in emergency this can be reduced to not less than 4 ft. From table edge to wall, 6 ft. is preferable, especially where wall seating is provided; in emergency this can be reduced to not less than 5 ft.

Regulation Bowling Alleys

On Plate 1 (following page) will be found floor plans of a pair and groups of three, four and six regulation bowling alleys showing dimensions, which are definite, and should be maintained to meet with the official rules and regulations. The ½-in. scale details indicate our suggested requirements for foundations to permit proper installation on solid concrete floors—this work is to be executed by other contractors.

Space for Players' and Spectators' Seats—Space (2 ft. 6 in.) for one row of players' benches should be provided for, at approach end in addition to the over-all length of alleys (83 ft.).

Spectators' seats are very essential and should be arranged for in at least one, two or three rows, according to available space, on stepped-up platforms. Where ceiling height permits, platforms can be built to a convenient height allowing space underneath for lockers, check room or storage.

Space for an aisle should be provided, if possible, without loss of units, alongside or between alleys, or in post areas, sufficiently wide to allow access to pin boys' room and storage space, which is usually located at rear of room.

Provision for Pit—Where alleys are to be installed in basement or on first floor on concrete foundation, a depression must be provided to receive the finished pit, two systems are suggested on Plate 1.

Special Improved Sub-foundations—We furnish and install improved sub-foundations for installations above first floor, which is our system of noise proofing and provides the necessary height required for pit depression.

Lighting—Lighting is a very important factor and should receive serious consideration; different size rooms and surroundings require different systems.

The most practical and economical idea is to place the ceiling lights back of beams wherever possible, one row of at least three, and preferably four, lights over center of each alley bed. This system provides an equal distribution and is most desirable, as all lights are concealed.

Another desirable system can be obtained by placing a row of lights over the center division between each pair of alleys, using ceiling fixtures, style of which is a matter of choice, but we recommend the use of either an open white shade deep enough to conceal light bulb—frosted bulb preferred—or a practical semi-indirect fixture placed at intervals most adapted to conditions. General illumination should be provided over approach, players' benches and spectators' seats as well as balance of room.

Pit or pin lights should be placed over the center of each alley bed. If overhead pin setting machines are used, pit lights should be placed 9 ft. 6 in. forward of rear of alleys or 5 ft. 6 in. forward of rear end of alley bed; if no overhead pin setters are used, place pin lights 8 ft. forward of rear of alleys or 4 ft. forward of rear end of alley bed.

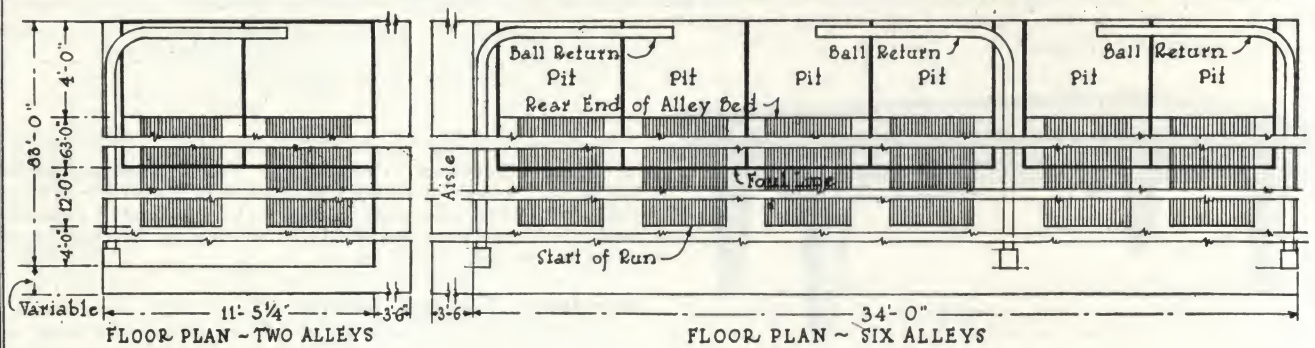

We recommend the use of the Brunswick Bowling Pit and Foul Light, which is a combination pin light and foul signal and is universally used where equipment consists of four or more alleys. We furnish instructions on wiring for these fixtures.

Ventilation—Proper ventilation should be given due consideration. Draughts should be avoided as they are detrimental to the health of both players and spectators. Properly designed artificial ventilation should be used as a protection to the health of the patrons and to conserve the heat in winter.

Experience and Co-operative Service

Our more than 31 years' experience has developed a technical and practical organization thoroughly equipped to handle and economically solve all problems pertaining to the design and proper installation of bowling alleys, squash courts, billiard tables, and shuffle boards.

There is a BRUNSWICK-BALKE-COLLENDER Co. branch in all principal cities in this country and Canada. Refer to telephone directory for the telephone number or address, or write main office. They will furnish without charge, blue prints, estimates and recommendations on any problem regarding Brunswick products.

NOTE~ 3'-6" Aisles on either side of the alleys are not imperative and may be reduced or eliminated if necessary

MOTOR OPERATION UNDER UNUSUAL CONDITIONS

Motor Operated Proscenium Walls, Curtains, Entire Stage, Stage Ceiling and Orchestra Pit

Municipal Auditorium of New Orleans, Louisiana, Favrot & Livaudais, Ltd., Architects

On this and the following page is illustrated an unusual case of motor operation in a building. It is perhaps one of the most unique large auditoriums in this country.

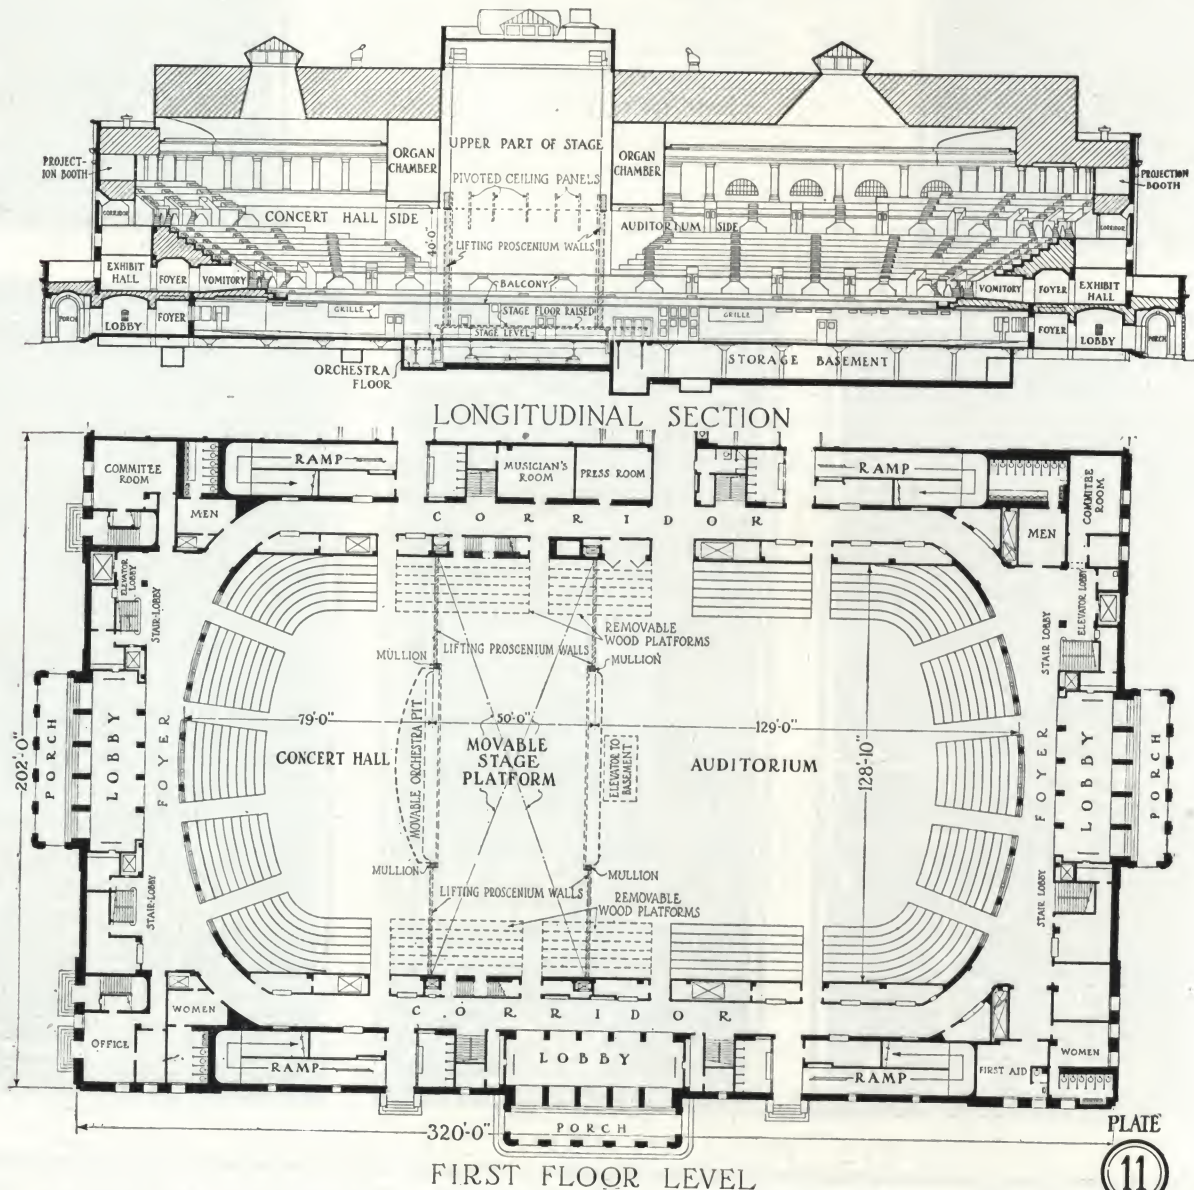

It can be used, not only for large conventions and gatherings, but the same space can also be used for an auditorium and a concert hall. This gives the hall a source of usefulness when it is not required for very large gatherings.

When used as a convention hall the large stage, platforms and orchestra pit are raised or lowered as required to make one floor level throughout the room. The proscenium curtains

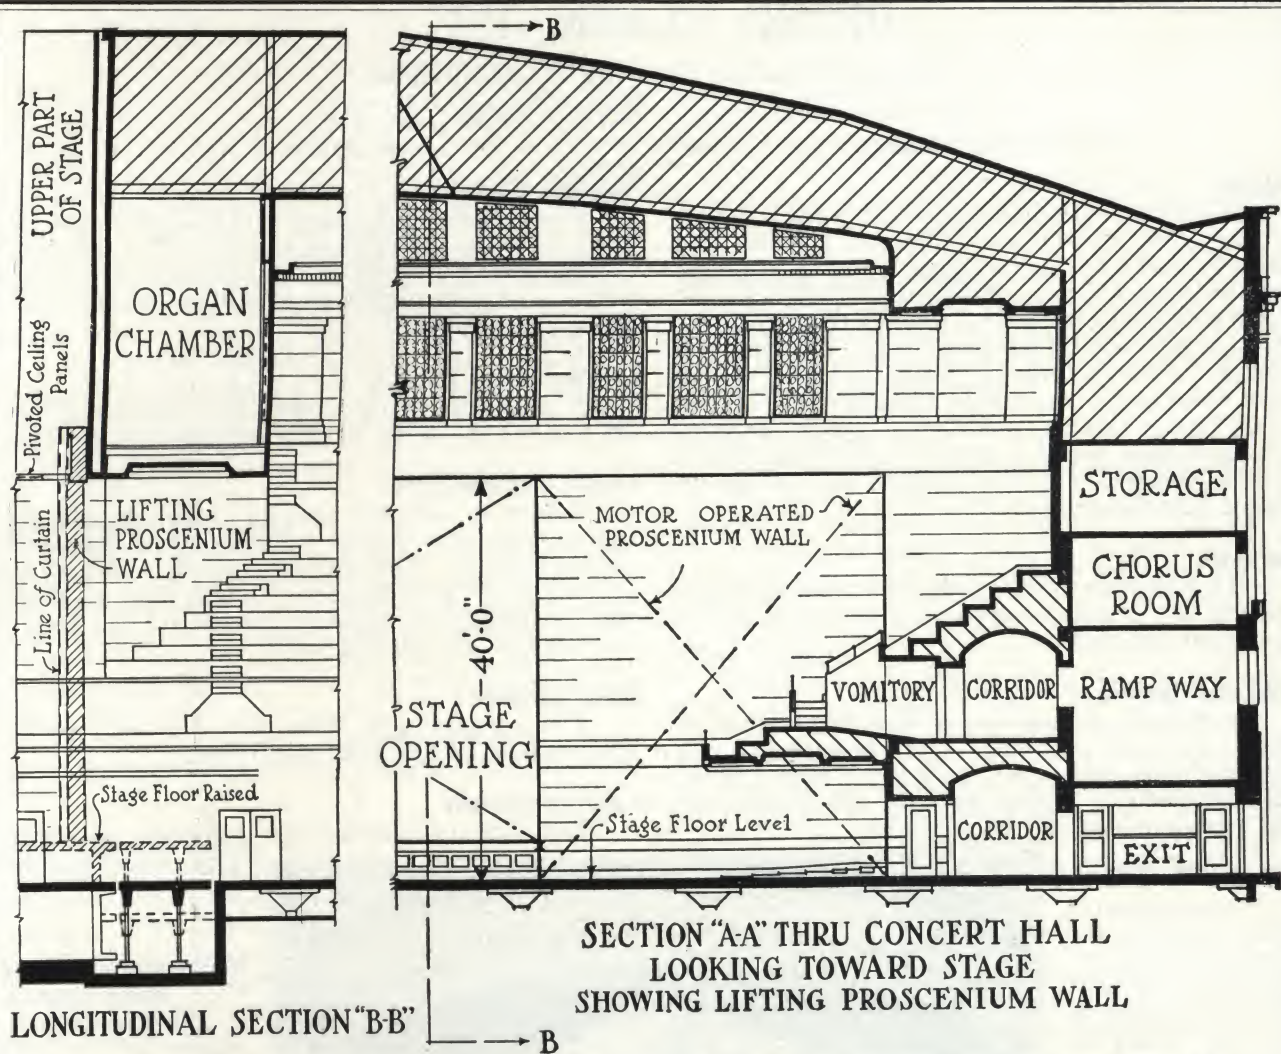

are raised and the proscenium walls at each side of the stage are also raised out of sight. The ceiling over the stage is pivoted in sections and is then closed, giving a complete ceiling over the stage.

The stage is operated in one section by means of synchronized operation of electrically driven screw jacks. The operation requires about 28 minutes.

This building is illustrated to demonstrate the range of electrically operative engineering which we are capable of handling, and in the hope that it may act as a suggestion for other problems of this nature.

Manufacturers of Stage Equipment

544 West 30th Street, NEW YORK, N. Y.

WESTERN REPRESENTATIVE: FRANK R. EASTMAN, 1773 No. El Molino Avenue, PASADENA, CAL.

Products

STAGE RIGGING; COUNTERWEIGHT SYSTEMS; ASBESTOS, STEEL AND SOUNDPROOF CURTAINS; HAND AND ELECTRIC CURTAIN HOIST; DRAW CURTAIN TRACKS; ELECTRIC DRAW CURTAIN MACHINES; ORCHESTRA PIT LIFTS; ORGAN CONSOLE LIFTS; STAGE LIFTS; MOVABLE STAGE BAND CARS; MOVIE TONE HORN TOWERS; MECHANICAL STAGE EFFECTS; MAGNASCOPE PICTURE SHEET FRAMES; STEEL FRAMES FOR PICTURE SHEETS; METAL TICKET RACKS AND CASES; PIANO TRUCKS; BUS TURNABLES; PORTABLE SEATING; PLATFORM LIFTS.

Also Theatrical Iron Work, Stage Floor Traps and Portable Ballroom Floors.

Guarantee

All equipment and effects are sold with a full guarantee that any defects in material or workmanship will be promptly rectified.

Architects' Service

We maintain an engineering department organized to help with your problems. Our engineers, at your disposal without charge, will lay out the stage rigging, plans and gridiron, paying particular attention to unusual conditions that may be presented.

Orchestra Pit Lifts

For featuring orchestra numbers, the entire floor of the orchestra pit is the platform of a multiple screw lift. The platform is lowered to the basement level where musicians enter or leave through a convenient door without annoyance to the patrons. While playing, the platform is brought to stage level for the overture. The platform can be lowered to an intermediate level, out of the sight lines of the audience, for accompanying the production.

The orchestra lift is electric driven and automatically controlled by push buttons.

The leader, by pushing proper button for any of the levels, can bring platform to desired position where it will automatically stop.

The machinery is operated by one motor; it is worm gear driven and is ball bearing throughout. Operation can be arranged from two or more points.

Stage Rigging and Hardware

A complete line of stage accessories embracing every appliance needed for the modern stage. Catalogue on request.

Asbestos Curtains

Flexible asbestos fire curtain of plain or woven wire cloth. Asbestos cloth curtain with rigid steel frame, has a layer of cloth on both auditorium and stage side of curtain. Curtains rigged so that they descend under their own weight.

Counterweight Hoist

A small portable hoist used with counterweight system and for any other hoisting necessities on the stage.

Organ Console Lifts

Similar to orchestra pit lifts, except that the platform is only large enough to hold console and usually are single screw. They are automatically controlled and operated in the same manner. Console lifts can also be made to revolve so organist presents a better view to the audience when playing a solo.

Steel Curtains

Fire curtains with sheet steel face and vitrified asbestos back on structural iron frame.

Contour Curtain

New type of automatically controlled act curtain. This curtain will give any drape effect desired.

Magnascope Picture Sheet Frames

Steel picture sheet frames with automatic maskings so that two or three sizes of picture can be shown on the same sheet. Also steel frame for picture sheets. These frames carry permanent masking.

Movietone Horn Telescoping Towers

For mounting talkie horns adjustable in height. Towers on casters so they can be moved about stage.

One of the Largest Steel and Asbestos Curtains in the World—108 Ft. Wide

LOCKWOOD, GREENE COMPANY, Boston, Mass. and COOK & BLAUNT, New York, N. Y., Architects

Designed and installed by PETER CLARK, INC. in the new Convention Hall, Atlantic City, N. J.

Counterweight System

This system does away with fly galleries and operating of scenery from the flies, as all drops are handled from the stage floor.

Each set consists of a pipe batten long enough for width of opening—batten equipped with quick acting clamps or chains with snap hooks for attaching scenery to batten. Batten is hung by steel cables which run over loft blocks which have self-lubricating bearing, to roller bearing head block, and cables are attached to counterweight frame with trimming chains.

Counterweight frame is equipped with fibre guides which run on tee-iron tracks. Tracks are placed on side

wall of stage house. Counterweight frames are open on end so weight can be easily added or taken off frame.

The set is operated by a manila rope hand line which is attached to top of counterweight frame and run over head block through locking clamp, thence over tension pulley and up to bottom of frame.

There is a loading platform at the upper travel of frame where frame is loaded or unloaded when scenery is put on or taken off of pipe batten. Across the entire front of the system, on the stage floor, is a locking rail which has rope locks and also card index for marking sets. Also across entire front of system there is an illuminated strip for lighting, with subdued light, the locking rail. On this strip the sets are numbered consecutively. During a production the system is operated from the stage floor. The ease and quickness with which scenes can be handled, make it worth while to install this system, to say nothing of the labor saved.

Ticket Racks and Cases

Made of metal to special order for requirements. Practical for both advance and daily rush sales. Compartments are built on an angle so as to show the stub of first ticket in each row with the seat number. *A rack for each performance.* All cases made to order to accommodate any number of performances and conditions of box office.

Send seating plan, exact size and thickness of tickets used; also plans of box office for cases, when requesting prices.

Draw Curtain Tracks

Two types of steel draw track—steel wood lined with lignum vitae ball slides—steel track with rubber-tired carriages. The steel casing has welded joints. Track sheaves are ball bearing in iron frames with guards to prevent rope from getting off sheave. Tracks are noiseless and dustproof, and are designed for easy hanging of curtains.

Soundproof Curtains

Used in schools to separate gymnasiums from auditoriums. Have a sheet steel center covered on both sides with sound resisting material. Have a structural iron frame covered on both sides with asbestos cloth.

Curtain Hoists

Hand operated for small curtains, placed in gridiron. Electric hoists for larger curtains. Two types, one

for installation in gridiron and the other for installation in basement under stage. All hoists, whether hand or electric, are designed so that curtains can descend under their own weight.

Electric Draw Curtain Control

Smooth running machine enabling the operation of curtain from any desired points. Variable speeds, if desired.

Mechanical Stage Effects

Our knowledge of this highly special line has been gained through 25 years of experience, backed by technical knowledge. We accomplish results that are practical and mechanically correct.

Portable Seating

Designed for your seating requirements. Made in standard sections of the tower and girder type of construction of interchangeable units. This type can also be covered with portable flooring to make a ramped floor. Easily handled and requires minimum space for storage.

Piano Trucks

Adjustable steel frame with noiseless swivel castors to fit under piano legs.

Bus Turntables

Rigid steel construction—electrically operated—remote control. Roller bearing throughout. Built for any capacity or requirements desired. The largest bus turntable in the country was built by us for the Central Union Bus Terminal in New York City.

Heavy Duty Platform Lifts

Built on jackscrew principal—similar to orchestra lifts—for industrial purposes such as: Lumber stacking, car loading, etc. All lifts built to specification.

Movable Stage Band Cars

Cars to move entire stage band up and down stage.

Movietone Lifts

Sections of stage made platform of telescoping lift. Horns hung on underside of platform. Lift located directly behind movietone screen. When raised lift brings horns to desired height. When lowered horns are stored under stage.

Theatrical, Decorative and Spectacular Lighting

TELEPHONES

COLUMBUS 0130, 0132

321 West 50th Street
NEW YORK, N. Y.

ESTABLISHED 1896

A Complete Line of Lighting Specialties for Theatrical, Decorative and Spectacular Lighting

Footlights—Any form desired. Standard designs for lamps from 60 to 150 watts; permanent semiflush types for frequent use; disappearing types for occasional use. Well ventilated. Proper light distribution. Approved by Underwriters. Completely wired, usually for independent control of three colors.

No. 621—Enclosed permanent semiflush type footlight, for 100-watt PS lamps; double row of receptacles, spaced 4½-in. centers; with spun aluminum reflector for each lamp, and adaptor for colored glass, diffusing roundels; completely wired for three colors, with splice box for making connections.

No. 621

No. 831

No. 831—Disappearing type footlight for 24 100-watt lamps, double row receptacles spaced 4½ in. on centers, fitted with individual reflectors and colored glass roundels; wired on 3 2-wire circuits, with splice box for making feeder connections; constructed so that when not in use they may be closed down flush with the stage floor; furnished complete in standard 5-ft. sections ready for installation.

KLIEGL FOOTLIGHTS

No.	Description
Permanent Semi-flush Type	
622	Single row open trough, for 60 or 75-watt lamps.
624	Double row open trough, for 60 or 75-watt lamps.
623	Compartment type with color frames, for 150-watt lamps.
620	Single row enclosed trough, with roundels, for 100 or 150-watt lamps.
621	Double row enclosed trough, with roundels, for 100 or 150-watt lamps.
Disappearing Type	
829	Single row open trough, for 60, 75 or 100-watt lamps.
828	Double row open trough, for 60, 75 or 100-watt lamps.
827	Compartment type, with color frames, for 60, 75 or 100-watt lamps.
830	Single row enclosed trough, with roundels, for 60, 75 or 100-watt lamps.
831	Double row enclosed trough, with roundels, for 60, 75 or 100-watt lamps.

Note: Footlights can be furnished with receptacles spaced wider apart than specified above, or with a greater number of circuits for more colors, or other changes as desired.

Blue prints for use in planning footlight installations, showing construction details and dimensions of Klieg Footlights, available on request.

No. 675

Aisle Lights and Step Lights

No. 675—Aisle spotlight, for mounting on side of end seats adjoining aisle ways or on sidewalls; equipped with lens which distributes the light downward; cast aluminum casing; ½-in. conduit connection can be made at the bottom or rear; for 100-watt lamp. Size 6x3 in. x 2½ in. deep.

No. 676—Aisle light, vertical type, for flush wall mounting, usually used in side aisles; consists of a medium screw base receptacle mounted in a heavy gauge galvanized sheet iron box, 7¼x4½ in. x 3½ in. deep, with ½-in. knockouts in sides, rear and bottom; removable cast aluminum front 8¼x4½ in.; louvered openings direct light to floor; for a 40-watt lamp.

No. 677—Step light, horizontal type, for stairways; ordinarily is set in the step flush with the riser; substantially made to withstand kicks and knocks of moving feet; louvered openings direct light to floor; constructed similar to No. 676.

No. 676

No. 677

Borderlights—Any form desired; built for lamps from 60 to 1000 watts; made of galvanized sheet iron; strong; rigid; well ventilated; comply with Underwriters' requirements; in one continuous length or in any length sections; wired, usually for independent control of three colors.

No. 603—Enclosed type borderlight, for 300 to 500-watt PS Mazda lamps; single row of receptacles, spaced 10-in. centers; with double focus reflector for each lamp and adaptor for holding 9-in. colored glass diffusing roundels; also with slide grooves for holding metal frames for gelatin color mediums or colored glass slides; furnished with splice box for making feeder connections, chains, and 1½-in. pipe batten for hanging.

No. 603

KLIEGL BORDERLIGHTS

No.	Description
600	Open trough type borderlight, for 60 to 100-watt lamps.
612	Compartment type borderlight, with color frames, for 100 to 200-watt lamps.
613	Compartment type borderlight, with color frames, for 500-watt lamps.
614	Compartment type borderlight, with color frames, for 1000-watt lamps.
602	Enclosed type borderlight, with roundels, for 200-watt lamps.
603	Enclosed type borderlight, with roundels, for 300 to 500-watt lamps.
604	Enclosed type borderlight, with roundels, for 750 to 1000-watt lamps.

Note: Borderlights can be furnished with lamps spaced wider apart than specified in description, or with a greater number of circuits for more colors, or other changes that may be necessitated by particular requirements.

Spotlights—Every form, all sizes, arc and Mazda types—properly designed for flexibility, ease of adjustment, thorough ventilation, correct lighting, maximum efficiency; comply with Underwriters' requirements.

No. 70

No. 72

No. 70—Mazda spotlight for 1000-watt concentrated filament lamp; with mogul screw base receptacle; hood mounted in trunnion and swivel bearings. Equipped with 5-in. lens; slide grooves for color frames; receptacle on sliding base, with extension wing nut for focusing, 5-in. chromium plated metal reflector back of lamp.

No. 72—Mazda spotlight for 1000-watt G40 or 2000-watt G48 concentrated filament lamp, with automatically operated color frames.

General design of spotlight is same as No. 70, except fitted with 6-in. lens and equipped with 4 color frames operated by an electro-magnetic device—permitting entire service of spotlight, including white lighting, color lighting, and dimming, all to be controlled from a distant point.

Cab and Number Calls—*Cab and Carriage Calls*—Rapid and effective means of calling vehicles to doorways of theaters, hotels, department stores, and other public buildings. They obviate confusion and shouting; require no key-cards or other contrivances; are visible day and night; can be read from a distance of several blocks; and are unaffected by weather conditions.

Number Calls—Are similar devices but used for announcing price quotations, score figures, and the like.

Exit and Illuminated Signs—Made in a variety of standard designs, also to customers' specifications. They meet all safety requirements of Underwriters and local fire departments. Metal construction throughout. Attractively finished.

No. 688

KLIEGL ILLUMINATED SIGNS

No.	Description	Size of surface plate and depth of box, in.	Height of letters, in.
Surface Wall Type Exit Signs			
680	Single face, rectangular; sheet metal box finished in gold with grooved front, open on one side to receive ruby glass face plate; white letters.	10 x 5 x 5	3
685		11 3/4 x 6 3/4 x 5	5
686		14 x 8 x 5	6
687		12 x 10 x 5	8
690		15 3/4 x 10 x 5	8
691		15 3/4 x 10 x 5	8
692		21 3/4 x 10 1/4 x 5	8
6800	Double faced, rectangular; sheet metal box finished in gold with ruby glass face plate on two sides; white letters; grooved sides open on ends, permitting removal of glass and access to lamps.	10 x 5 x 5	3
6850		11 3/4 x 6 3/4 x 5	5
6860		14 x 8 x 5	6
6900		15 3/4 x 10 1/4 x 5	8
6910		15 3/4 x 10 1/4 x 5	8
6920		21 3/4 x 10 1/4 x 5	8
688	Double faced, triangular; sheet metal box finished in gold with two ruby glass face plates; white letters; front end piece detachable, permitting removal of glass and access to lamp; small opening on bottom, covered with frosted glass, directs subdued light on floor.	10 x 10 x 3	6

Flush Wall Type Exit Signs

694	Ruby glass face plate; white letters; galvanized sheet metal box, removable hinged front; exposed metal parts finished in gold.	16 x 11 x 5	8
695		24 3/4 x 11 x 5	8
694B	Cathedral leaded amber-and-opal glass face with ruby glass letters; galvanized sheet metal box; removable hinged front; exposed metal parts finished in gold.	16 x 11 x 5	8
695B		24 3/4 x 11 x 5	8
694C	All-metal face; letters cut out; backed by perforated translucent metal shield; wording appears illuminated in red; galvanized sheet metal box; removable hinged front; exposed metal parts finished in gold.	16 x 11 x 5	8
695C		24 3/4 x 11 x 5	8
697	Ruby glass face plate; fancy white letters; galvanized sheet metal box; removable cast bronze frame with swinging door; dull bronze finish.	15 3/4 x 9 x 5	4
697W	Ruby glass face plate with metal guard; fancy white letters; galvanized sheet metal box; removable cast bronze frame with swinging door; dull bronze finish. For gymnasiums, basketball and handball courts, etc., where glass face, if unprotected, is likely to be broken.	15 3/4 x 9 x 5	4

Suspension Type Exit Signs

693	Single face; clear glass; white letters; lamp concealed in metal supporting member; all exposed metal parts finished in gold.	16x18	6
6930	Double faced; clear glass; white letters illuminated through edge of glass; lamp concealed in metal supporting member; all exposed metal parts finished in gold.	16x8	6

Globe Type Exit Signs

725	Round globe; 4-in. diameter; red glass with spring clamp globe holder for mounting on wall over a receptacle containing a 40-watt Mazda lamp; white lettering.		2
726	Round globe; 6-in. diameter; red glass with opening on top for attaching to 3/4-in. shade holder; white lettering.		2 1/2
728	Flat-round opal glass globe; 8-in. diameter, with opening on top for attaching to 3/4-in. shade holder; red letters.		4

Box Signs

716	Single-face	Sheet metal box signs; square corners, with black glass front plate; white letters. All exposed metal parts finished in gold. Any wording may be specified.	14x5x5	3
717			14x5x5	3
720			14x5x5	3
714	Double-face		14x5x5	3
715			14x5x5	3
721			14x5x5	3

Green or other colored glass can also be furnished with exit signs—prices on application. Exit signs with special lettering can be furnished—prices on application.

No. 1610

Outdoor Floodlights—Units of all description; various types for close or long-range floodlighting, concentrated or wide beam.

No. 1610—Floodlight for 1000-watt PS Mazda lamp, projects concentrated beam of light long distance; fitted with special heat resisting mirrored glass reflector, 13 5/8-in. diameter, mounted within housing; mogul screw base receptacle with adjustment for focusing; housing of cast aluminum and sheet metal, weatherproof and thoroughly ventilated; clear glass front lens is set in hinged frame,

permitting access to interior. Floodlight is mounted in swivel yoke on short stand permitting any desired setting.

No. 562—Floodlight for 2 1000-watt PS Mazda lamps—a gigantic reflector for floodlighting large open spaces; projects extremely wide spread of light without blinding glare. Body of reflector is cast aluminum, weatherproof, houses 2 mogul screw base receptacles; base fitted with adjustable bracket permits mounting on pole or vertical support; reflector hood made of galvanized sheet iron (or of sheet aluminum No. 562A), spreads out to an opening 30 1/2 x 28 in.

No. 562

KLIEGL OUTDOOR FLOODLIGHTS

No.	Description
1600	For 250 or 400-watt G30 lamp; with short stand.
1601	Same as No. 1600, for 500-watt G40 lamp.
1610	For 1000-watt PS lamp, with short stand (concentrated light beam).
1611	Same as No. 1610, with 3-ft. pedestal stand.
1612	For 1000-watt PS lamp; with short stand (wide spread light beam).
1613	Same as No. 1612; with 3-ft. pedestal stand.
562	For two 1000-watt PS lamps; with bracket mounting.
562A	Same as No. 562; except hood is of sheet aluminum.
568	For one 1000-watt PS lamp; with bracket mounting (of sheet aluminum similar to No. 562A except it is for one lamp).
565	Suspension type, for one 500 or 1000-watt PS lamp.
565A	Same as 565; hood of sheet aluminum.

Stage-floor Pockets and Plugs—

For connecting stage lamps and other devices to supply circuits. Pockets set in floor flush with the surface and have hinged self-closing cover notched for cable. Plugs furnished with stage pockets. Any desired combination of arc and incandescent pockets, from 1 to 4, can be furnished. Pockets and plugs approved by Underwriters.

No. 351

KLIEGL STAGE-FLOOR POCKETS AND PLUGS

No.	Number of pockets	Rating of receptacles

Products

National Distributors, Sales and Service Representatives of leading manufacturers of THEATRE EQUIPMENT, which includes the following products:

Moving Picture Projectors; Motor Generator Sets; Moving Picture Screens; Distributing Switchboards; Effect Projectors; Changeover Devices; Opera Chairs; Loge Chairs; Directional Signs; Lighting Fixtures; Ventilating Equipment; Carpets and House Draperies; Scenery and Stage Draperies; Automatic Curtain Controls; Stage Rigging and Hardware; Stage Lighting Equipment; Theatre Switchboards; Theatre Dimmers; Lobby Display Frames; Marquises; Electric Signs; Coin Changers; Ticket Selling Machines; Ticket Choppers; Leather Link Matting; Aisle Ropes and Railings; Ticket Booths; Equipment and Supplies of every description for moving picture and legitimate theatres, schools and public auditoriums.

Kino Booth Equipment

Moving Picture Projectors—All models.

Motor Generator Sets—All types and capacities for moving picture projection as needed, including accessories for talking pictures.

Effect Projectors—Stage effect equipment for operation from the Kino booth.

Moving Picture Screens—Built to specification for various light sources; either sound or silent pictures.

Auditorium Equipment

Opera Chairs and Loge Chairs—Beautiful designs, also special designs specified built to order. Designs submitted without cost.

Directional Signs—Produced for us by a leading manufacturer. Special period designs to order. Sketches furnished on request.

Lighting Fixtures—For all styles of architecture and all classes of theatres. Illuminated drinking fountains, exit signs and other decorative fixtures. Period designs built to order.

Ventilating Equipment—All types of ventilating apparatus, including blower and exhaust fans.

Carpets and Draperies—A highly specialized department. Particularly important where sound pictures are shown.

Stage Equipment

Scenery and Stage Draperies—Employing our own staff of stage specialists and utilizing the entire output of one of the largest, oldest and best known

scenic studios in the country, we are in a position to render the highest type of service and the finest artistry in stagecraft. Special sketches on request.

Automatic Curtain Controls—Noiseless and smooth in operation. We also supply special noiseless curtain tracks.

Stage Rigging and Hardware—A complete line of all stage accessories embracing every appliance needed for the modern stage.

Stage Lighting Devices—For regular requirements. Also special equipment for spectacular effects designed and built to order.

Theatre Switchboards—Sole distributors of the National System manually and electrically operated switchboards and panels; designed by Westinghouse engineers.

Distributing Switchboards—National System distributing panels, manually or electrically operated or entirely automatic.

Theatre Dimmers—Special dimmer banks made up to specification.

Lobby and Foyer

Lobby Display Frames—Both stock and special built-to-order frames and fixtures are available in either embossed wood or ornamental crafts.

Marquises—Built to order in any special design or decorative treatment desired.

Electric Signs—Reliable and complete sign service. Name flasher signs and changeable program boards of every description. Sketches rendered gratis.

Coin Changers—All well and favorably known devices.

Ticket Selling Machines—Ticket Choppers—Ticket Booths—Aisle Ropes and Railings—All of the best in style and materials.

Leather Link Matting—Attractive, durable, easy to stand on and noiseless.

Our Service to Architects

In close co-operation with the architect, co-ordinating the processes of construction and equipment, grouping the entire equipment into one unified contract and following it through to completion, it is possible for us to save the architect and builder much time, worry and expense and the ever-present possibility of error.

The service outlined above is available to all architects. We invite inquiries on any subject that pertains to theatre equipment and with branch offices located in all principal cities of the United States we are in readiness to serve with promptness and efficiency.

McSHANE BELL FOUNDRY CO.

ESTABLISHED 1856
BY HENRY McSHANE

MAIN OFFICE AND FOUNDRY
Harford Avenue and B. & O. R. R.
BALTIMORE, MD.

INCORPORATED 1904

Products

Founders of CHURCH BELLS, CHIMES, PEAL and CHAPEL BELLS; FIRE ALARM, COURTHOUSE and TOWER CLOCK BELLS; also WESTMINSTER CLOCK CHIMES, and SCHOOLHOUSE BELLS.

McSHANE TUBULAR TOWER CHIMES, operated electrically from a standard keyboard.

This company specializes in the building of Musical Bells of the highest standard, Chimes for churches and Tower Clocks.

McShane Electric Chiming Action

Designed to operate on 220-volt 60-cycle alternating current.

The keyboard may be placed in any desired location. It contains a row of keys, to the underside of which are attached contacts which act as the medium for completing circuits which operate the relays.

The relays in turn cause the operating units to function, thereby bringing into action hammers which strike the bells. There is a key for each bell in the chime.

The action is instantaneous.

There are no motors, generators or other complicated equipment.

The consumption of current is exceedingly small, being used only with each pressure of a key.

Suggestions for Construction of Belfries

Best results are obtained when floor of bell deck is on a level with comb of roof of the building.

Place windows, which should be 12 to 16 ft. high, on a level with belfry floor and a ceiling just above top of windows.

See that windows are as large and open as possible and if louvers are used, see that they be pitched so as not to obstruct entirely the carrying of the tone.

Make provisions for admission of bell.

McShane Tubular Tower Chimes A Most Satisfying Substitute for Bells—These tubular

tower chimes built by McShane, according to McShane's unequalled standard of attunement, produce a purity and mellowness of tone which is exceedingly sweet. The carrying power is not so great as that of bells, but the effect produced is that of a full church chime. Their clearness and volume of sound is such that every note can be easily distinguished within the radius of a mile (depending on location).

Simple Construction and Installation; No Vibration—McShane Tubular Chimes consist of a series of bronze composition metal tubes suspended from a framework of wood. Bells or tubes range from 5 to 10 ft. in length and 12 to 14 in. in circumference. Bells are struck by hardwood-tipped hammers at the upper end of the graded tubes.

The vibration is confined almost entirely to the tubes, and they can with perfect safety be placed in a tower not specially constructed to receive a set of bells.

J. C. DEAGAN, INC.

Manufacturers of Tower Chimes

TELEPHONE
LAKEVIEW 4364

MAIN OFFICE AND FACTORY
Deagan Building, 1770 Berteau Avenue
CHICAGO, ILL.

WEST COAST OFFICE: E. J. EXTER (Representative), 1306 Fuller Avenue, Hollywood, Calif.—Telephone, Gladstone 1002

Products

J. C. DEAGAN, INC., is the originator and the largest builder of electrically operated TUBULAR BELL TOWER CHIMES.

Also manufacturers of Scientific Tuning Devices (used in U. S. Bureau of Standards, Washington, D. C.), Percussion Musical Instruments for handplaying and organ use, Electric Door Chimes, Altar Chimes, etc.

Growing Importance of Tower Chimes

While the cultural and inspirational value of Tower Chimes has been recognized for centuries, it is only in recent years that users have begun to appreciate their importance from an investment standpoint. *Churchmen* have found the automatically played daily concerts a powerful aid in increasing and holding membership. Owners of *office buildings* have discovered in Chimes a means of quickly gaining the renown that prospective tenants like to associate with their address, while to *cemetery officials* the mellow music has become a "voice" almost magical in its effectiveness—a "voice" perfectly in keeping with the peaceful surroundings, that draws hundreds of visitors who would otherwise be unaware of the cemetery's advantages.

The Deagan Electric Player

Located at any desired distance from the Chimes, it reproduces with absolute fidelity the expertly played program of Master Chimers

Service to Architects

In view of the facts contained in the foregoing paragraph, architects planning churches, public buildings, office structures, college buildings, country estates or cemetery improvements are urged to consult the Service Bureau of J. C. DEAGAN, INC., for important information on the operation and installation of Tower Chimes. Although Deagan Chimes, immune to

the elements, may be installed in almost any structure, it is obvious that for best results certain principles should be observed. These principles, involving the design of louvers, size of openings, size of scuttles, wiring information, etc., will gladly be explained in detail on request.

Even if impossible to consider Tower Chimes as part of the original plan, it is sound economy to provide for their possible installation later.

Master Clock

By merely setting the selector the Electric Player may be made to start the Chimes automatically at any desired hour, and to shut them off automatically when the desired program has been concluded

Advantages of Tubular Bell Tower Chimes

(1) A degree of tuning accuracy never before attainable; (2) uniformity of volume and tonal characteristics throughout the entire register; (3) beauty of tone; (4) carrying power equal to or exceeding that of any Chimes on which musical selections are played.

Automatically or Hand Played

As the Deagan Patented Damper (see following page) is one of the greatest of all improvements in the design of Tower Chimes, so, we claim, is the Deagan Automatic Player unquestionably the greatest of all improvements in operating methods.

Through this device the fear that the Tower Chimes will be infrequently or inexpertly played is completely removed.

The function of the Deagan Electric Player is to reproduce with absolute and unvarying fidelity the expression, technique and fine tempo shadings of expert handplaying. A library of hand-recorded reproducing rolls, containing music for all occasions, places at the "command" of

Deagan Westminster Chiming Device Mounted in Wall

Deagan Tower Chimes Played Direct from Organ Console

Through automatically played Tower Chimes the church becomes, even more intimately than before, a part of community life. The morning program, twilight concert and 9 o'clock curfew are eagerly awaited daily events

the man in charge of the Chimes, 365 days a year, the "services" of a Master Chimer.

The Electric Player may be started either by a convenient push button, located at any desired distance from the Chimes, or by a Master Clock set to play either a single piece or an entire program, automatically, at any desired hour.

The Electric Player starts the Chimes automatically, plays them exactly as a Master Chimer would play them, and automatically shuts them off when the desired program has been concluded. Thus, the donor of Tower Chimes, installing them as a memorial, may arrange, if desired, that the favorite hymn of the departed one be played automatically and unfailingly at a certain hour each day.

Deagan Electric Tower Chime Action
Length, 42 in.

Other Playing Methods

In addition to automatic playing, Deagan Tower Chimes may be played (1) from an electric keyboard, (2) direct from organ console and (3) from Deagan time-marking devices such as Westminster or "Praise" Peal, Automatic Angelus, etc.

Time-marking Devices

The Deagan Westminster Chiming Device automatically sounds the Westminster Peal at the conclusion of each quarter hour with the correct number of hour strokes on the fourth quarter. The "Praise" Peal, designed for Catholic Churches, is a copyrighted version of "Holy God, We Praise Thy Name," especially adapted to time-marking purposes.

Because Deagan Time-marking Peals are automatically shut off when other playing methods are in use, there is no danger of conflict with the Electric Player or keyboard operation. Where it is desired to silence the Chimes during the night the device can be set to "shut off" at any hour and set to "cut in" automatically in the morning.

Deagan Patented Damper Shown Pressing Against and Silencing One Chime as Other is Sounded

Deagan Electric Damper (Patented)

This, one of the greatest inventions in Tower Chimes history, automatically silences each tone at the precise instant the next one is sounded, causing the melody to stand out clear and distinct. It is entirely different in principle from the piano damper which stops the tone when the key or pedal

The Deagan Electric Keyboard

Placed wherever desired and permits the playing of the Chimes independent of organ or Electric Player

and damper which stops the tone when the key or pedal

is released. The Deagan Tower Chime Damper does not silence the chime tone until the succeeding key at the keyboard is depressed.

This ingenious and altogether unique principle of operation entirely eliminates all intermingling or "running together" of tones—a defect in Chimes which is the usual cause for the frequent popular belief that certain Chimes are "out of tune." A separate damper is placed under each chime as shown in the illustration.

Twenty-tone Set Deagan Tower Chimes Mounted on Rack

Deagan Electric Tower Chime Action (Patented)

The Deagan Patented Tower Chime Action is marvelously efficient. When any key of the keyboard is depressed, the plunger of the corresponding action is propelled forward electrically and delivers against the chime a mighty blow, far more powerful than would be possible with any hand-operated mechanism. With lightning-like rapidity the plunger is automatically returned to its original position, ready for the next stroke. Despite the great strength of the forward blow very little current is consumed.

A Weatherproof Hood makes Deagan Tower Chime Actions absolutely impervious to climatic conditions.

Weight and Space Required

Special strengthening of belfry or roof is very seldom required for Deagan Tower Chimes. Volume of tone is secured without excessive tonnage.

Each chime is suspended by a cable which allows every ounce of metal to vibrate. A complete set of 25 tones installed ready for playing weighs approximately 14,000 lbs.

Installation

Deagan Tower Chimes are installed by our own erectors, thus insuring perfect results.

Hundreds of Satisfied Users

It has been the privilege of J. C. DEAGAN, INC., to serve hundreds of churches, country estates, war memorials, universities, cemeteries, office and public buildings in every part of the United States and Canada. An impressive portfolio containing the expressions of a few users will be mailed on request.

MENEELY & COMPANY (INC.)

WATERVLIET, N. Y.

Products

CHURCH BELLS, CHURCH-BELL CHIMES, PEALS and CARILLONS OF BELLS.

Bells Are Scientifically and Accurately Made

Between 1890 and 1895 we made the important discovery that the tone elements of bells could be accurately and absolutely determined with the aid of specially designed instruments, and that such bells, when intended for musical sets (chimes, peals and carillons) could be musically harmonized in themselves and with each other by mechanical processes and methods of testing, thus obtaining results never attained before.

While this is the oldest bell foundry in the country, it is the newest and most modern in its practices, mechanical equipment, and scientific and special appliances necessary for the best workmanship and the definite determination of exact musical results.

Only the highest grade of bells and fixtures are shipped from our foundry.

Carillons

A carillon consists of at least 23 bells corresponding to the full chromatic scale, all tones and semi-tones, through two or more octaves.

Carillon of Bells

Electric Chiming Device

Chimes electrically equipped are played from a small keyboard placed near the organ console. The electric equipment consists of a keyboard, a contact panel, and electric units which are connected with the clappers of the bells.

THE STEELCRETE SYSTEM of BURGLAR and MOB RESISTING BANK VAULT CONSTRUCTION.

For Steelcrete Concrete Reinforcing Mesh and Industrial Mesh and Framing Accessories for open mesh partitions, window guards, etc., see Manufacturers' Index.

Section of Steelcrete Armor Mat

Placed either horizontally or vertically, Steelcrete forms a thick entanglement of steel that is proof within all practical limits against torch, drill, shock, fire and explosives. Concrete is poured through and around the steel matrix to form a wall of great structural strength.

Planning for Adequate Vault Protection

In planning a vault, maximum resistance to burglarious and mob attacks together with structural strength are the fundamental considerations. Modern methods of attack have made it necessary to incorporate these features to produce a completely protected self-contained unit of safety. The walls, roofs and floor of a vault constitute over 90% of the area of attack and it is obvious that just as serious consideration be given to the proper reinforcement of these vulnerable points as is given to the selection of the vault door.

Steelcrete 5-Point Protection

The Steelcrete Armor Mat is composed of thousands of strands of steel, thoroughly embedded in concrete producing a network that effectually resists

cutting flame, drill, explosives, fire and falling loads. In this entanglement of steel and concrete (point 1) drills fail to penetrate; (point 2) the cutting flame is helpless against concrete; (point 3) explosives lose their force in ab-

sorption by the thousands of steel strands; (point 4) stronger structurally than steel alone or concrete alone because of the reinforcing principle employed, and (point 5) neither steel nor concrete is inflammable and the thickness of the wall, ceiling and floor slabs minimizes the transmission of heat from the exterior to contents of the vault. Tests conducted under the direction of the architects of the Federal Reserve Board have shown that a steel entanglement properly embedded in concrete constitutes the strongest and the most economical protection against attack.

DRILL PROOF

TORCH PROOF

BLAST PROOF

FIRE PROOF

SHOCK PROOF

Great Structural Strength

The Steelcrete Armor Mat is built up of steel units, extending layer after layer through the entire vault walls, roof and floor. Constructed in this manner, it is a self-contained unit of great structural strength, which successfully withstands the impact of falling girders, heavy safes and other terrific impact loads, often the result of fire. The tremendous structural strength of a Steelcrete Vault Roof Slab was recently brought out in a test, when a slab having a total depth of 18 in. carried a load of more than 1 ton per sq. ft. on a span of 30 ft.

Most Economical Protection

Tests conducted under the direction of the Federal Reserve Board Architects have demonstrated beyond question that the Steelcrete System offers greater protection for each dollar invested than any other system of protection. As a result of these tests the Steelcrete System was installed in the largest bank in the United States—the New York Federal Reserve Bank. The Steelcrete System is adaptable to all requirements and can be used with utmost economy in both large and small bank vaults.

Easily Erected by Any Skilled Contractor.

The simplicity of the Steelcrete System makes it possible for any skilled contractor to successfully handle the erection. Working drawings making for rapid field erection are furnished by the manufacturers for each installation and the field engineers of the manufacturer keep in constant touch with the work, insuring an entirely satisfactory installation.

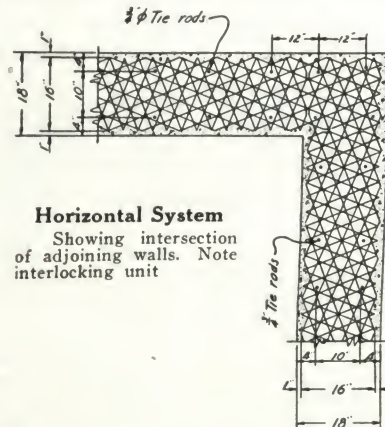

Horizontal System of Protection

The protection afforded per dollar invested in the Steelcrete Horizontal Type Vault, exceeds that of any other protective system, offering the bank the utmost security with unusual economy.

shall conform to Type H... The Steelcrete Armor Mat shall be placed in the center of the wall, and be built up in the field in strict accordance with the detailed drawings as submitted to the architect for approval.

Vertical System of Protection

The Steelcrete Vertical System was developed in answer to a demand for a vault reinforcing system offering, like the horizontal system, the greatest protection per dollar of cost, but with a greater spacing between units.

RIVET-GRIP BANK VAULT REINFORCEMENT.

Also manufacturers of Rivet-Grip Rigid, Shop-fabricated Truss Bridge Roadway Reinforcement (description on request).

For RG Steel Deck Construction and RG T-Bar Joists and RG Nailer Joists, see Manufacturers' Index.

Rivet-Grip Reinforcement—Vertical Type

Rivet-Grip Vaults

The high regard which bank architects and engineers have for Rivet-Grip vaults and the prestige which the system has attained are evidenced by the fact that the Rivet-Grip System has been installed in nearly twice as many Federal Reserve vaults as any other type of vault reinforcement offered on the market since the Federal Reserve vault tests. It is significant that in every instance where Rivet-Grip was purchased by a Federal Reserve Bank, either an official of the bank, its architect, or vault engineer represented the bank at the Federal Reserve tests, and the sale of Rivet-Grip was due to recommendations carried back by eye witnesses, after seeing the performance of Rivet-Grip in these severe tests.

Balanced Protection for Bank Vaults—The first requisite for security in a bank vault is *balanced protection*—equal protective strength throughout. In other words, the walls, floor and roof should be no less secure than the vault door. In the Rivet-Grip System, this balanced protection is obtained through a new system of steel reinforcement, which is fabricated in various sizes to give the walls and slabs a protective value equivalent to that of any particular door from 4 to 48 in. in thickness.

Design—The Rivet-Grip System consists of an interlocking network of heavy shop-fabricated frames and plain round bars, embedded and interlocked through practically the full thickness of the concrete work.

There are no weak points in a Rivet-Grip protected vault. The frames interlock at all corners. The door connections are as strong as the vault door itself. The scientific design of Rivet-Grip reinforcement insures balanced protection throughout.

The Rivet-Grip frames are composed of two parallel, heavy Rivet-Grip main sections, joined at close intervals by lighter diagonals, which form the web of the frames. The joint, or Rivet-Grip, is formed under a 30-ton pressure which forces the metal in the main sections around the knobs on the diagonals, joining these members so securely that the diagonals will break in tension before loosening at the Rivet-Grip.

The loose bars are laced through the frames perpendicular to the plane of the web members. They are held in position automatically and need not be wired.

All Rivet-Grip reinforcement is accurately fabricated and comes to the job true to detail. There are two types of installations: *vertical*, for use in walls from 12 to 30 in. thick, and *horizontal type*, for use in walls from 27 to 60 in. thick.

Structural and Economic Advantages

In addition to its protective value, many structural and economic advantages help to explain the wide choice of Rivet-Grip System.

Lowest Insurance Ratings—Rivet-Grip walls and slabs receive the lowest insurance ratings.

Flexibility of Arrangement—The spacing and general

arrangement of the frames may be varied to give the exact degree of protection desired.

Structural Strength—Rivet-Grip frames form an efficient structural reinforcing, and allow vault walls and slabs to be designed for carrying heavy building columns, or with clear spans up to 40 ft.

Ease of Installation—All material is completely shop-fabricated and ready to place before shipment. To unload the reinforcement from trucks and place it in its proper position in the vault requires only five to eight man-hours per ton.

Lower Cost—The Rivet-Grip System of vault reinforcement costs less than any other adequate and effective system and the ease with which it is installed materially lowers construction cost.

Designing and Estimating Service

The drawings on the following page will prove useful as a guide for selecting the proper type of Rivet-Grip reinforcement to use with any particular vault door. However, if the types shown do not fit your problem, our Engineering Department will gladly make a study and submit a layout and we will recommend the most economical solution of your problem without incurring any obligation on your part, if plans or dimension sketches of the vault are submitted to us. Whenever available, thickness of doors and linings should also be given.

Lump sum estimates, either for material only or including erection for any vault, gladly furnished to architects.

(Complete handbook on the design and construction of modern bank vaults will be sent on request.)

Specifications

Reinforcement—The reinforcement shall be the "Rivet-Grip System bank vault reinforcement" as produced by THE RIVET-GRIP STEEL CO., Cleveland, Ohio.

The arrangements of Rivet-Grip frames and plain round bars shall conform to that shown on page C4007 of SWEET'S ARCHITECTURAL CATALOGUES, Twenty-fourth Edition, for Type spacing of frames. The reinforcement shall be detailed for walls in., floor slab in., and roof slab in. thick.

All units shall interlock at all intersections of walls, and of walls and slabs, and special provision shall be made at door openings to strengthen connections between door frames and vestibules and reinforced concrete walls.

All units shall be completely shop-fabricated and shipped ready to place. They shall be tagged with an erection mark corresponding to the marks on the drawings furnished by the manufacturer.

Note: This specification applies only to the vertical type. Specifications covering our horizontal type are especially written for each individual vault.

Drawings—THE RIVET-GRIP STEEL Co. shall furnish complete placing drawings showing the exact location of each frame and spacer bar. Two sets of prints of approved placing plans and details shall be furnished for use in placing steel.

Concrete—Shall be proportion of 1 part portland cement, 2 parts clean siliceous and $3\frac{1}{2}$ parts $\frac{3}{4}$ -in. gravel or $\frac{3}{4}$ -in. crushed stone.

Rivet-Grip Reinforcement—Horizontal Type

**Torch Resisting**

Rivet-Grip channel sections are hard to burn as concrete adheres firmly to the steel within channel.

**Tool Resisting**

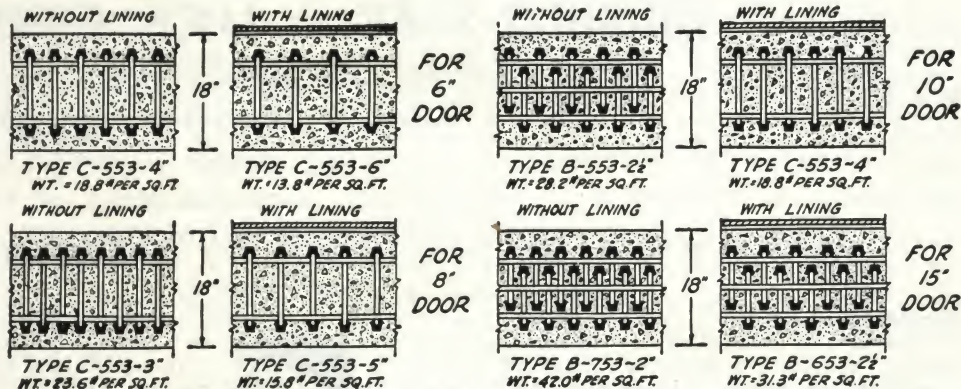

Rivet-Grip Reinforcement is torch and tool resisting. Its multiplicity of heavy members cannot be cut or pierced with cold cutting tools and drills as is possible with lighter members and fabrics.

**Resists Explosives**

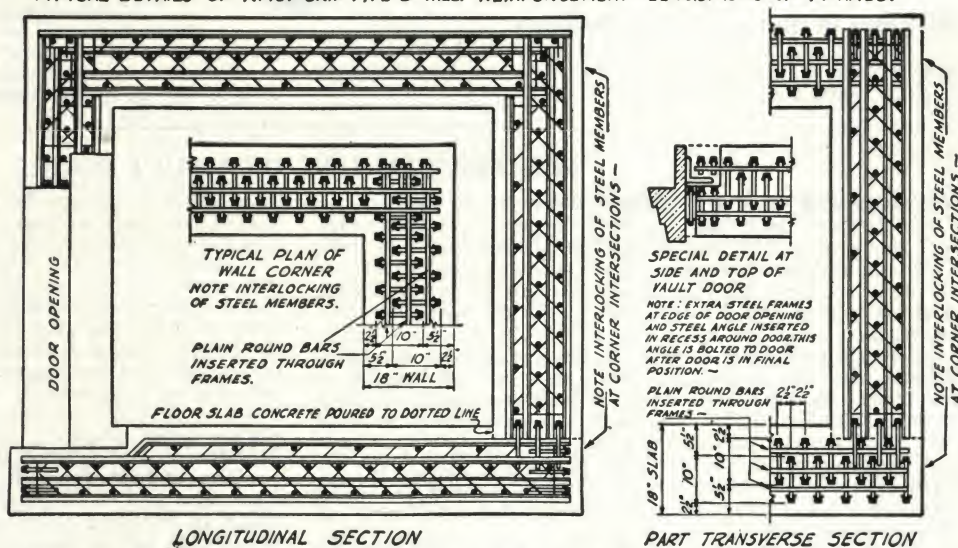

The large proportion of heavy steel members and rigid attachment of ties or stirrups to main bars keeps Rivet-Grip units intact even after severe detonations.

**Structurally Strong**

Rivet-Grip Bank Vault Reinforcement is not only impregnable to burglarious or riotous attack, but is strong enough structurally to resist breaking or crushing due to a collapse of the building from fire or other causes.

Suggested Types of Rivet-Grip System Reinforcement to Balance Various Thicknesses of Vault Doors

TYPICAL DETAILS OF RIVET-Grip TYPE "B" VAULT REINFORCEMENT—2½" OC. SPACING OF FRAMES.

Diagrams Above Show the General Method of Detailing Rivet-Grip Reinforcement When the Most Popular Type, Namely Type B-553—2½-in. Spacing of Units—Is Used

Vaults with 18-in. concrete walls and slabs with this type of reinforcement get the best, or No. 10 insurance rating without the use of steel lining in the vaults. Complete typical details and specifications for types of Rivet-Grip other than those illustrated will be furnished upon request.

Products

BANK and SAFE DEPOSIT VAULTS and VAULT FRONTS, including: Safe Deposit Boxes, Linings and Complete Equipment; FIRE-RESISTIVE VAULT DOORS, plate and filled; FIRE-RESISTIVE SAFES and FILING SAFES; STEEL MONEY CHESTS, rectangular and round doors.

During this period many Diebold safes and vaults have successfully withstood the severest tests, in actual service, as is attested by the many letters in our files.

Co-operative Service to Architects

Our Engineering Department, together with the entire personnel of our various branch offices, is at the disposal of the architect or contractor.

Sketches and estimates on special work, as well as stock designs will be gladly furnished, without charge.

70 Years of Successful Safe Building

The recognized quality of the Diebold Product is the result of experience as designers, engineers and manufacturers of bank vaults and safes since 1859.

THE TRIUMPH LINE OF VAULT DOORS

Development of the Triumph Line

Independent tests made by the Underwriters' Laboratories, Inc., published in their Report SP-1.669 on November 30, 1927, on an uninsulated steel plate vault door proved conclusively the need of doors affording much greater protection in this class. The door tested was typical of the old style plate door construction.

The old style plate door failed the test at the end of 27½ minutes when the temperature inside the vault reached 300°—and it was fully grouted in the opening and the inside doors closed. With the inside doors open it was found that it would have stood the test only 10 minutes.

The Underwriters reported that the old style plate door offered uncertain protection because the proper grouting of the door and the closing of the inside doors could not be guaranteed in actual practice.

Quick to appreciate the need of vault doors offering reliable protection our engineers in conjunction with tests in the Underwriters' Laboratories, Inc., developed the Diebold Triumph Line of Fire-Resistive Vault Doors. The line includes doors offering a minimum of from 29 minutes to 6 hours resistance, based on Underwriters' tests. None of them require inside doors. All of them except the No. 156 (6-hour Label Door) are designed to eliminate a complete grout in installation.

Our engineers discovered that the weakness of the old style door lay in its construction. When exposed to intense heat the buckling and warping of the exposed surfaces opened direct passages into the vault for the entrance of heat and flame. This weakness was overcome in the Triumph line. Comparatively light gauge metal is used for the outer door plate and frame—the surfaces exposed to intense heat. Heavy gauge formed "Z" bars and other members reinforce the outer door plate and frame from the inside, reducing the strains of buckling and warping of the exposed surfaces. It is this principle of construction that prevents the buckling and warping of the exposed outer surfaces of the doors from opening direct passages into the vault. Tongues and grooves on the insulated doors, and box tongues with overlapping plates on the light doors assist in preventing openings into the vault.

The Triumph Line

The Diebold Triumph Line Vault Doors include doors

One-piece Anti-warp Channel

Insulation Reinforcing

Off-set Jamb

both with and without the Underwriters' labels. Protection is offered for every average risk. This line of doors is shown with full particulars in the following pages.

Tests—All of the Triumph Line Doors, with the exception of the Nos. 215 and 235 Burglar-resistive Doors, have been tested in the following manner: The door is placed in a masonry wall the same as in actual practice and the heat applied for the length of time determined by the classification. A second test is made by heating the door in the furnace for one-half the endurance period. It is removed from the furnace and while in heated condition subjected to a standard fire hose stream under pressure. The door is then reheated in the furnace for the remainder of endurance period.

The Diebold Triumph Line Vault Doors have withstood these tests and have proved that they prevent the direct entrance of heat and flame into the vault. Be sure your vault is equipped with a door that offers certified protection in the degree suited to your risk.

Construction—Triumph Line Vault Doors are constructed entirely by the electric welding process. Screws are used to attach removable parts only.

Tests as conclusive as those that have proved the electric welded joint superior to rivets in skyscraper and bridge construction have proved it more suitable for vault door construction.

The Patented Off-set Jamb—The No. 152 Triumph Line Door has a patented off-set jamb construction. This is the first two-hour Underwriters' Label vault door that eliminated the usual installation difficulties. The off-set built into the masonry opening is covered with a point grout of mortar applied quickly with a trowel. The door is easily set and adjusted in the opening without further trouble.

Reinforced Insulation—The cut below shows the method of reinforcing the insulation of Diebold Triumph Line Insulated Vault Doors. Three heavy horizontal cross braces behind the insulation, and attached to the jambs, carry the vertical "U" bars in straps over which a heavy reinforcing cross wire mesh is laid. The vertical "U" bars extend the full height of the door and the reinforcing mesh covers the entire surface. The insulation is supported and reinforced entirely independently of the outer door plate. There is no possible danger of the outer door plate damaging the insulation when it warps and buckles because of exposure to intense heat—it cannot pull the insulation from the jambs.

Anti-warp Channel—The light-weight doors, "R," "S," "Tile" and "L" are constructed with the anti-warp channel illustrated at the lower left hand corner of the preceding page. This channel is formed from a solid piece of heavy gauge metal and attached to the sides of the vestibule on the front of the door back of the front frame. At all times this anti-warp channel maintains constant contact with the face of the wall, preventing the direct passage of heat and flame into the vault.

Locks—The lock used on all the Triumph Line Vault Doors is the Diebold No. 900 3-tumbler, key-changing combination lock. The lock is equipped with a patented re-locking device. It is capable of millions of changes of combination.

Installation—Triumph Line Vault Doors are built with a removable back frame attached with screws to the vestibule body. The back frame is removed, the door set in the opening and leveled, and the frame drawn to the wall with the screws.

GENERAL RECOMMENDATIONS FOR FIRE-RESISTIVE VAULT CONSTRUCTION

The following recommendations will in a general way be helpful in the construction of fire-resistive vaults. They are general in nature since the individual conditions that surround the building of every vault cannot be foreseen.

Before the vault is built, the services of a competent architect or contractor should be secured to determine the degree of protection required, to make the proper allowances for floor strength, to determine the structural strength required of the vault in relation to the whole structure and to arrange for the proper footings for the vault.

Plan of Vault

At the bottom of this page are shown vertical and horizontal sections through model fire-resistive vaults with dimension lines indicated by letters. The following paragraphs will explain them in detail:

"W" Width of Vault—The maximum width should not exceed 10 ft. When a greater width than 10 ft. is required, interior columns, girders or division walls should be used.

"D" Depth of Vault—The inside depth of the vault is optional.

"O" Masonry Opening for Vault Door—The actual dimensions are determined by the door used.

"S" Vault Wall Thickness—The wall thickness of structure supported vaults, that is vaults supported by the framework of buildings of fire-resistive construction, shall be as follows:

For vaults requiring six hours or more heat resistance—

- (1) Reinforced concrete 10 in.
- (2) Brick or plain concrete 12 in.
- (3) Protected steel or reinforced concrete frame with reinforced concrete panels 8 in. Brick or plain concrete panels 12 in.

For vaults requiring two hours heat resistance—

- (1) Reinforced concrete 6 in.
- (2) Plain brick 8 in.
- (3) Hollow clay tile or concrete block 12 in.
- (4) Protected steel or reinforced concrete frame with reinforced concrete panels 6 in. Brick or plain concrete panels 8 in. Hollow clay tile or concrete block panel 12 in.

The wall thickness for ground supported vaults, that is, vaults supported directly on the ground and independently of the building in which they are located, should be constructed in accordance with the following tables:

MINIMUM WALL THICKNESSES—GROUND SUPPORTED VAULTS

Six-hour Vaults					Two-hour Vaults				
Number of stories counting from top down	Kind of wall construction				Number of stories counting from top down	Kind of wall construction			
	Reinforced concrete, in.	Brick or plain concrete, in.	Reinforced concrete panels, in.	Protected steel or reinforced concrete frames		Reinforced concrete, in.	Brick, in.	Hollow clay tile or concrete block, in.	Protected steel or reinforced concrete frames
Top	10	12	10	12	Top	6	8	12	6
2nd	10	12	10	12	2nd	8	12	12	8
3rd	10	12	10	12	3rd	10	12	16	10
4th	12	16	10	12	4th	10	16	20	10
5th	12	16	12	16	5th	12	16	20	12
6th	12	20	12	16	6th	12	16	20	12
7th	12	16	7th	20	12
8th	12	16	8th	20	12
9th	12	16	9th	20	12
10th	14	16	10th	20	12

Structural Independence

The vault walls should be structurally independent of the building wherever possible. If connected in any manner, the connection should be so made that in the event of the collapse of the building, the building members may move or fall without affecting the stability or fire-resistive qualities of the vault. In fire-resistive vault construction, provision should be made for expansion of the interior building members since severe thrust may be exerted on the vault structure.

Where building members join those of the vault, they shall project into the vault not more than 4 in. and in no case should the wall thickness be less than 8 in. at these points. All beams or bearing members adjoining the vault should be designed to release freely in event of failure. Where the outside walls of the building are used to serve as a portion of the vault wall, the vault walls should be effectively bonded to the building wall.

"F" Thickness of Front Walls—The thickness of the front wall, at the point allowed for the opening of the vault door, is determined by the door used.

"H" Height of Vault—The inside height of the vault should not exceed 11 ft.

"R" Roof of Vault—The roof should be at least 8 in. thick of reinforced concrete or protected structural steel with reinforced concrete slab or filler of adequate strength and fire resistance. The roof should be designed for a live load of at least 350 lb. per sq. ft. to take all of impact loading. Where local conditions are especially severe, loads of from 500 to 1000 lb. per sq. ft. should be provided for.

"P" Parapet—If the roof of the vault is more than 12 in. below the roof of the building, the vault walls should be parapeted at least 12 in. above the vault roof and the space thus formed filled with sand, gypsum or similar material, to act as a cushion against impact from falling materials and also to serve as further insulation against accumulation of burning debris on the vault roof. Adequate drainage shall be provided for this space above the roof.

Material for Vault

Solid wall construction is recommended for vaults where the maximum resistance to heat is required. Solid walls offer more resistance to the impact of falling bodies such as machinery, safes and fixtures.

These factors are of vital importance in considering the type of vault to be built. In case of a severe fire the vault must be structurally strong to withstand the shock of falling bodies.

Concrete, on account of its monolithic character, is admirably suited for vault construction. Brick masonry can also be laid so as to be practically monolithic in character. If it is carefully laid in this manner, it may be successfully used for vault construction. From structural considerations, steel frame work is advisable when vaults are built more than a few stories high.

RECOMMENDED RECORD ROOM CONSTRUCTION

The record room must have no other opening than the one protected by a record room door. No wood or other combustible material should be used in the construction of a record room or for its floor or trim.

In the right hand column are shown a vertical and a horizontal section of a record room illustrating how the building walls become part of the structure supported vault when built in accordance with the general recommended construction as outlined below. The recommended construction is general in character. Before the record room is built, the services of a competent architect or builder should be secured.

"W, D and H" Dimensions—The width, depth and height of the vault are optional with the exception that the height should not exceed 15 ft. and the total volume should not exceed 50,000 cu. ft.

"F" Front Wall Thickness—The thickness of the front wall of the record room is determined by the type of door used. A record room door bearing the Underwriters' fire classification one-half hour label requires a vestibule 9 in. deep. The wall at the opening must be built to take this door in order to secure the benefit of the Underwriters' Label. If other doors are considered, the thickness of the front wall at the opening will be determined by the door used.

"S" Thickness of Side and Rear Wall—Structural considerations require that the side and rear walls should offer a minimum of two hours heat resistance. The recommended minimum for the thickness of these walls is: Reinforced concrete 4 in.; plain concrete or concrete blocks 6 in.; brick 8 in.

Construction

The record room may be constructed in such a manner that it uses the floor, ceiling and one or more walls of the building as its own, providing none of the walls has a fire resistance less than the walls of the record room itself.

The vertical joints should be well anchored or bonded and the joining of all walls with the building and with each other secured.

The record room must have no other opening than the one protected by a record room door.

If vertical shafts of the building, such as elevator shafts, are adjacent to the record room they should be separated by walls having a fire resistance equal to the walls of the record room.

HOW TO SELECT THE TYPE OF VAULT DOOR

No. 1 For a Fire-resistive Vault

(A)—For a ground supported vault entirely independent of the building. A ground supported vault is intended to afford full protection for its contents even in the event of complete destruction of the building.

A 2-hour vault door (Diebold style No. 152) is recommended for the vaults on all floors except the bottom floor.

A 6-hour vault door (Diebold style No. 156) is recommended for the vault on the bottom floor due to the soaking heat from the accumulation of hot and burning debris around the vault after the collapse of the building.

(B)—For a structure supported vault entirely dependent upon the frame work of the building. Structure supported vaults may be located on any floor of a modern fire-resistive building. They are designed to afford complete protection for the contents assuming that the building will not collapse in the event of a fire.

A 2-hour vault door (Diebold style No. 152) is recommended for the structure supported vault since it will be subjected only to the heat of the burning combustible materials on the one floor on which the vault is located.

A 6-hour vault door (Diebold style No. 156) is recommended where the structure supported vault is located near a concentration of combustible materials such as records (in libraries and court houses), merchandise (in warehouses and store rooms) and other severe risks.

No. 2 For a Record Room

The record room is an enclosure of fire-resistive construction intended for use where the volume of records is too large and not of sufficient importance to justify economically the provision of either vaults or safes, but still is sufficiently valuable to warrant a certain amount of special protection.

A record room should be used only in a building of modern fire-resistive construction.

A one-half hour Diebold style "L" Record Room Door is recommended for the record room. If inside doors are considered an advantage the Diebold styles "R" and "S" Vault Doors are recommended.

No. 3 for a Burglar-resistive Vault

The minimum degree of burglar protection required for the vault of a commercial institution can best be determined by the rate of burglary insurance based on the volume of insurance to be carried.

It is recommended that the minimum protection should be a Class "D" vault requiring a solid steel door 1½ in. thick (Diebold style No. 215).

Where additional burglary protection is required, see the No. 235 Class "E" Burglar-resistive Vault Door, or write for recommendations and specifications on Diebold Bank Vault Doors.

GOVERNMENT VAULT AND CLOSET DOORS

Built to Government Specifications and Drawings, M-352-F

FILM VAULTS AND SAFES

The proper storage of films is vital for the protection of human life. Because of the conflicting recommendations of experts and legislation in the various states and municipalities, at the time of going to press we felt it unsafe to catalogue equipment.

Our engineers are conducting experiments and keeping in touch with the problem constantly. We have suggested designs for both safes and vaults that will be furnished gladly on request. These suggestions will be revised and kept up to date. We invite correspondence.

FIRE-RESISTIVE VAULT DOOR—STYLE NO. 152

Recommended Use

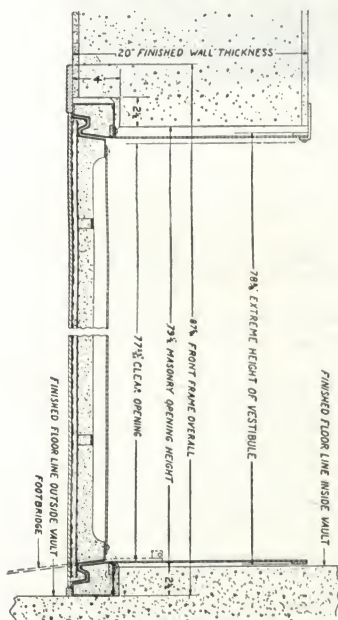

Style No. 152 Vault Door is designed for severe fire risks. It should be used for ground supported vaults on the upper stories of buildings where floors may give way during the fire, or in structure supported vaults in modern fire resistive buildings.

It is recommended as the minimum protection for vaults in any location that are used for the housing of vital and irreplaceable records such as tracings, surveys, vital statistics, etc.

Manufacturer's Specifications

- (1) **Label**—Underwriters' Laboratories Inspected Vault Door Fire Classification 2 hours.
- (2) **Clear Opening**—29 $\frac{1}{8}$ in. wide by 77 $\frac{3}{8}$ in. high.
- (3) **Over All Door Thickness**—3 $\frac{1}{8}$ in.
- (4) **Door Construction**— $\frac{1}{8}$ -in. front plate, 2 in. of Diebold fire-resistive insulation increasing to 3 in. along edges, and $\frac{1}{8}$ in. inside cover plate. Insulation reinforced as indicated on vertical and horizontal sections.
- (5) **Masonry Opening**—32 in. wide by 79 $\frac{1}{2}$ in. high with 2 $\frac{1}{2}$ -in. by 4-in. offset.
- (6) **Wall Thickness**—20 in. including finish. Minimum thickness is 8 in. for 2-hour label door.
- (7) **Extreme Swing of Door**—37 in.
- (8) **Vestibule Body Over All**—30 $\frac{3}{8}$ in. wide by 78 $\frac{3}{8}$ in. high.
- (9) **Installation**—A light mortar grout only is required. See detail masonry drawing.
- (10) **Front Frame Over All**—42 $\frac{1}{8}$ in. wide by 87 $\frac{3}{8}$ in. high.
- (11) **Back Frame**—Removable.

- (12) **Bolts**—Ten $\frac{3}{4}$ -in. bolts, five at front and five at hinge side.
- (13) **Lock**—Diebold 3-tumbler combination lock with patented re-locking device.
- (14) **Bolt Handle**—A drop handle with bronze knob and black bakelite grip.

To Specify This Door Write—"Diebold Standard Style No. 152 Vault Door." Specify the swing of the door as right or left as you face it. The door illustrated is right swing.

No. 152 Fire-resistive Door—Open

Instructions for Setting

- (1) Dimensions of wall openings should be as shown on masonry plans for this entrance.
- (2) Uncrate door and remove rear flanges.
- (3) Thoroughly soak face of rabbet and point edge with rich lime mortar as shown by Figure 3 below.

Caution: The pointing of rabbet should be thoroughly and carefully done to insure full protection of the door. The joint between wall and door must be tight.

- (4) Place door and frame in position in opening.
- (5) Replace rear flanges.
- (6) Open and close door to see that it hangs plumb and swings easily. If the door strikes on bottom, shim up under the hinge side of vestibule; if door strikes on top, shim up under the opposite corner.

- (7) If when the door is properly placed, the back flanges do not lie up flat against the inside face of the wall, fill in the space between it and the wall with filler strips.
- (8) Fill in uneven spaces between flanges and walls with cement or plaster.

FIRE-RESISTIVE VAULT DOOR—STYLE No. 156

Description

Style No. 156 Fire-resistive Insulated Vault Door is intended for severe fire risks. It affords a minimum of six hours heat resistance based on the standard vault door test.

The door must be fully grouted with cement in the opening.

The reinforcement of the insulation in the door is entirely independent of the outer door plate. Therefore the strains that may be set up in the outer frame and door plate cannot affect the insulation, which is firmly supported from the inside of the door.

The tongue and groove jamb construction is used on all four sides of the door. There is an inclined metal foot bridge with rubber tread hinged on the jambs at the bottom of the door.

Manufacturer's Specifications

(1) **Label**—Underwriters' Laboratories Inspected Vault Door Fire Classification 6 hours.

(2) **Clear Opening**—32 in. wide by 77 $\frac{3}{4}$ in. high.

(3) **Over-all Door Thickness**—6 $\frac{1}{8}$ in.

(4) **Door Construction**— $\frac{1}{8}$ in. front plate, 4 $\frac{7}{8}$ in. of Diebold fire-resistive insulation and $\frac{1}{8}$ in. inside cover plate. Insulation reinforced by two layers of steel reinforcing anchored to door cross braces.

(5) **Masonry Opening**—See drawings in next column.

(6) **Extreme Swing of Door**—39 $\frac{1}{8}$ in.

(7) **Installation**—Follow instructions in next column.

(8) **Front Frame Over All**—49 in. wide by 91 $\frac{1}{8}$ in. high.

(9) **Bolts**—Ten $\frac{3}{4}$ -in. diameter bolts, five at front and five at hinge side.

(10) **Lock**—Diebold 3-tumbler combination lock with patented re-locking device.

(11) **Bolt Handle**—A drop handle with bronze knob and black bakelite grip.

(12) **Hinges**—Three heavy malleable iron pin hinges.

(13) **Jambs**—On all four sides of the door and vestibule the jambs are formed with a deep tongue and groove.

(14) **Foot Bridge**—An inclined metal foot bridge at the bottom of the door.

(15) **Finish**—Olive green duco with gold decorations. Hinge tips, combination dial, and ring and handle knob are brushed bronze.

The lock and bolt handle grips are black bakelite.

(16) **Shipping Weight**—1650 lb.

Note: This door will fit any wall thickness over 10 in. and can be finished in special colors.

To Specify This Door Write—"Diebold Standard Style No. 156 Vault Door." Specify the swing of the door as right or left as you face it. The door illustrated is right swing.

No. 156 Fire-resistive Door—Open

Instructions for Installing

(1) Provide wall opening of dimensions shown on masonry plans for this entrance.

Note: Make opening as closely as possible to given dimensions. Necessary allowances have been made for clearances.

(2) Make a grout of about two parts clean sand and one of portland cement and fill recess marked "A" on drawing below about $\frac{1}{2}$ full.

(3) Set door in opening and adjust door and frame plumb and level and wedge or prop frame in set position. Open and close door to see that it hangs plumb and swings easily; unless the frame has been properly set, the door will have a tendency to open or close of its own accord and further adjustments in leveling will be necessary until door remains in any set position.

(4) Secure door in place by attaching plates and anchor bolts "E."

(5) Block off with wooden strips or frame gaps at points marked "B" and "C" if necessary.

(6) Make a grout of same proportions as above but thin enough to be poured through opening "D" and flow readily into all the crevices between door frame and wall. Fill to top level of flange below opening "D" and fill opening "D" with concrete, brick or heavy concrete mortar.

(7) Allow forms to remain in position for at least four days, or until grout has set firmly, before removing forms to complete finishing plaster, etc.

RECORD ROOM DOOR—STYLE "L"

Recommended Use

The name "record room" identifies an enclosure of fire-resistive construction intended for use where the volume of records is too large and not of sufficient importance to justify economically the provision of vaults or safes, but where valuables warrant a certain amount of special protection. It should be used only in buildings of modern fire-resistive construction.

The record room is recommended for records classified as "important" by the National Fire Protection Association in its 1928 report. Included in this classification are statistical studies, derived accounting records and the great volume of operating records, particularly those of informative character, whose purpose is to maintain a check upon efficiencies.

While the records in this classification could be reproduced from the original sources it would cause considerable expense and labor. For these reasons record room protection is recommended.

Description

Style "L" Triumph Record Room Door bears the Underwriters' Laboratories Inspected Record Room Door Label, fire classification $\frac{1}{2}$ hour.

It is designed to afford a minimum of $\frac{1}{2}$ hour heat resistance without inside doors. It is unnecessary to grout the style "L" door in the opening.

The style "L" Triumph Line Record Room Door is the first improvement in a century in light fire-resistive vault doors.

$\frac{1}{8}$ -in. "Z" shaped bars forming the jambs are electrically welded, reinforced by three $\frac{1}{8}$ -in. "Z" shaped horizontal cross braces electrically welded to the door plate, and insulated cover plate on inside of door.

- (5) Masonry Opening—33 in. wide by 79 in. high.
- (6) Wall Thickness—9 in. including finish. Minimum thickness is 9 in. for $\frac{1}{2}$ -hour label.
- (7) Extreme Swing of Door—30 $\frac{1}{4}$ in.
- (8) Vestibule Body Over All—30 $\frac{1}{2}$ in. wide by 76 $\frac{1}{2}$ in. high.
- (9) Installation—No grouting required.
- (10) Front Frame Over All—38 $\frac{1}{4}$ in. wide by 80 $\frac{1}{2}$ in. high.
- (11) Back Frame—Removable.
- (12) Bolts—Five bolts of $\frac{3}{4}$ -in. dia. at front and interlocking channel at hinge side the full height of the door.
- (13) Lock—Diebold 3-tumbler combination lock with patented re-locking device.
- (14) Bolt Handle—A drop handle with bronze knob and black bakelite grip.
- (15) Hinges—Two heavy malleable iron pin hinges.
- (16) Jambs—The jambs of the vestibule are welded into a solid piece with a deep tongue striker. The frame of the door is formed from "Z" bars electrically welded.
- (17) Finish—Olive green duco with gold decoration. Hinge tips, combination dial, and ring and handle knob are brushed bronze. The combination lock and bolt handle grips are black bakelite.
- (18) Shipping Weight—375 lb.

Note: This door can be furnished special to fit a wall of any thickness over 9 in. and can be finished in special colors.

To Specify This Door Write—"Diebold Standard Style 'L' Vault Door." Specify the swing of the door as right or left as you face it. The door illustrated is right swing.

Manufacturer's Specifications

(1) Label—Underwriters' Laboratories Record Room Door fire classifications $\frac{1}{2}$ hour.

(2) Clear Opening—28 $\frac{1}{2}$ in. wide by 75 $\frac{3}{4}$ in. high. Entrance into vault is flush.

(3) Over-all Door Thickness—2 $\frac{1}{4}$ in.

(4) Door Construction— $\frac{1}{8}$ -in. outer door plate to which the four

Style "L" Record Room Door—Open

FIRE-RESISTIVE VAULT DOORS—STYLES "R" AND "S"

Recommended Use

Styles "R" and "S" Fire-resistive Vault Doors are recommended wherever inside doors are required for auxiliary protection in record rooms. The inside doors with key locks are useful for day-time operation.

The style "S" door is built with a wide opening for record rooms where busses are used.

The doors have a flush entrance from the office into the vault permitting the easy use of busses and transportable record trays.

Both of these doors are adaptable for installation in vaults where the wall openings are already built.

Description

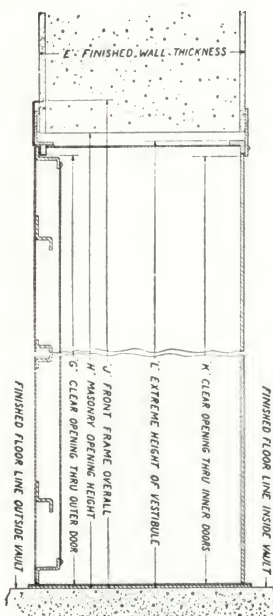

These doors with inside doors but without grouting offer forty to forty-five minutes protection.

Contrast the protection of these doors with the old style plate doors that offered twenty-seven minutes protection when fully grouted and with inside doors, based on tests by the Underwriters' Laboratories.

The anti-warp channel reinforcing the front frame and the deep box tongue of the jambs seals the doors against the direct passage of heat into the vault.

The interlocking channel on the hinge side the full height of the door effectually locks and seals these doors against the entrance of heat on this side.

Style "S"

- (1) Clear Opening through Inner Doors—34 in. wide by 75 $\frac{3}{4}$ in. high.
- (2) Clear Opening through Outer Door—35 $\frac{1}{2}$ in. wide by 75 $\frac{3}{4}$ in. high.
- (3) Over-all Outer Door Thickness—2 $\frac{1}{4}$ in.
- (4) Masonry Opening—40 in. wide by 79 in. high.
- (5) Wall Thickness—20 in. including finish. Wall must be 18 $\frac{1}{2}$ in. thick to allow inside doors to pocket.
- (6) Extreme Swing of Door—37 $\frac{1}{4}$ in.
- (7) Vestibule Body Over All—37 $\frac{3}{8}$ in. wide by 77 in. high.
- (8) Installation—No grouting required.
- (9) Front Frame Over All—45 $\frac{1}{4}$ in. wide by 80 $\frac{1}{8}$ in. high.
- (10) Back Frame—Removable.

Styles "R" and "S"

(11) Construction of Outer Door— $\frac{1}{8}$ -in. outer door plate to which the four $\frac{1}{8}$ -in. "Z" shaped bars forming the jambs are electrically welded reinforced by three "Z" shaped horizontal cross braces electrically welded to the door plate.

(12) Construction of Inner Doors—Each door has double inner doors $\frac{1}{8}$ in. thick locked at top, bottom and front with strap boltwork checked with a flat key lock. Boltwork is operated by a drop T handle.

(13) Bolts—Each door has five bolts of $\frac{3}{4}$ -in. dia. at front and interlocking channel at the hinge side the full height of the door.

(14) Lock—The outer doors have a Diebold 3-tumbler combination lock with patented re-locking device.

(15) Bolt Handle—Each door has a bolt handle with bronze knob and black bakelite grip.

(16) Hinges—Two heavy malleable iron pin hinges.

(17) Jambs—The jambs of the vestibule are formed and welded into a solid piece with a deep tongue striker. The frame of the door is formed from "Z" bars electrically welded.

(18) Finish—Each door is finished in olive green duco with gold decorations. Hinge tips, combination dial and ring and handle knob are brushed bronze. The combination lock and bolt handle grips are black bakelite.

(19) Shipping Weight—Style "R" 500 lb.; style "S" 650 lb.

Note: These doors can be furnished special to fit any wall thickness over 15 $\frac{1}{2}$ in. for the "R" and 18 $\frac{1}{2}$ in. for the "S" and can be finished in special colors.

To Specify These Doors Write—"Diebold Standard Style 'R' or Style 'S' Vault Door." Specify the swing of the doors as right or left as you face them. The door illustrated is right swing.

Styles "R" and "S" Fire-resistive
Doors—Open

FIRE-RESISTIVE VAULT DOOR—STYLE "TILE"**Recommended Use**

The "Tile" Fire-resistive Vault Door is stocked standard to fit a wall 9 in. thick including finish. In walls of this thickness or less inside doors are impracticable. They will not pocket in the vestibule and it is objectionable to swing them into the vault or allow them to extend through the front frame.

The ½-hour Underwriters' Label Record Room Door must be built with a vestibule 9 in. deep or greater. Since the "Tile" Door affords twenty-nine minutes protection based on tests in the Underwriters' Laboratories it is especially suited for those locations where it is impractical to build a 9-in. front wall.

Description

This door offers twenty-nine minutes protection without any grouting in contrast to the old style plate vault doors that offer only ten minutes protection when fully grouted. Based on tests in the Underwriters' Laboratories.

The anti-warpage channel reinforcing the front frame and the deep box tongue of the jambs seal the door against the direct passage of heat into the vault.

The cover plate over the boltwork adds to the appearance of the door and prevents the soiling of clothing on the working parts.

With the necessity of grouting eliminated there is no difficulty in installing the door.

Manufacturer's Specifications

- (1) Clear Opening—28½ in. wide by 75¾ in. high.
- (2) Over-all Door Thickness—2¼ in.
- (3) Door Construction—⅞-in. outer door plate to which the four ⅝-in. "Z" shaped bars forming the jambs are electrically welded reinforced by three "Z" shaped horizontal cross braces electrically welded to the door plate.
- (4) Masonry Opening—33 in. wide by 79 in. high.
- (5) Wall Thickness—9 in. including finish.
- (6) Extreme Swing of Door—30¼ in.
- (7) Vestibule Body Over All—30½ in. wide by 76½ in. high.
- (8) Installation—No grouting required.

Style "Tile" Fire-resistive Door—Open

(9) Front Frame Over All—38¼ in. wide by 80½ in. high.

(10) Back Frame—Removable.

(11) Bolts—Five bolts of ¾-in. dia. at front and interlocking channel at rear the full height of the door.

(12) Locks—Diebold 3-tumbler combination lock with patented re-locking device.

(13) Bolt Handle—A drop handle with bronze knob and black bakelite grip.

(14) Hinges—Two heavy malleable iron pin hinges.

(15) Jambs—The jambs of the vestibule are formed on three sides from a solid piece with a deep tongue striker. The frame of the door is formed from "Z" bars electrically welded.

(16) Finish—Olive green duco with gold decoration. Hinge tips, combination dial, and ring and handle knob are brushed bronze. The lock and bolt handle grips are black bakelite.

(17) Shipping Weight—375 lb.

Note: This door can be furnished special to fit any wall thickness and can be finished in special colors.

BURGLAR-RESISTIVE VAULT DOOR—STYLE NO. 215

Recommended Use

The style No. 215 Burglar-resistive Vault Door is designed for vaults built for protection from burglarious attack. Subject to the Class "D" Mercantile Burglary Insurance rates it reduces insurance premiums. It is recommended wherever this type of protection is required for securities or valuables.

Home owners will find it especially suited for silver and trunk storage vaults; manufacturers will find it desirable for the protection of templates, dies, chemicals and valuable parts and tools.

Where greater burglary protection is required see our No. 235 Vault Door and write for specifications of Diebold Bank Vault Doors.

Description

This door meets the requirements for Class "D" Mercantile Burglary Insurance.

It is hung on a goose-neck crane hinge operating on ball bearings. It is seated in its jamb with a two-point compressor system operated by a hand wheel with six hexagonal bakelite grips.

The door is standard with two 3-tumbler combination locks equipped with re-locking device, for additional protection.

A plate of 5-ply hardened chrome steel protects the locks and bolt throwing handle from burglarious attack by drilling.

Vertical Section through Style No. 215 Burglar-resistive Vault Door

Showing masonry clear opening and floor level dimensions

Manufacturer's Specifications

(1) Clear Opening into Vault—32 in. wide by 78 in. high.

(2) Over-all Door Thickness—The door is $3\frac{1}{8}$ in. thick on edge and measures 12 in. over compressor system.

(3) Door Construction—The solid steel thickness of the door is $1\frac{1}{2}$ in. built up of 1-in. and $\frac{1}{2}$ -in. open hearth steel plates. A 5-ply hardened chrome steel drillproof plate protects the locks and bolt handle.

(4) Masonry Opening— $44\frac{1}{2}$ in. wide by $85\frac{1}{8}$ in. high. Notice floor levels on sectional drawings in this column.

(5) Wall Thickness—20 in. including finish. If steel lining is to be attached to door write for special masonry drawing.

(6) Extreme Swing of Door— $39\frac{3}{8}$ in.

(7) Vestibule Body Over All—Constructed of 11-gauge steel; $40\frac{3}{4}$ in. wide by $83\frac{1}{8}$ in. high.

(8) Installation—The vestibule must be braced and grouted in the opening with cement.

Horizontal Section through Style No. 215 Vault Door

Illustrating construction and showing masonry with clear opening dimensions

(9) Architraves— $48\frac{1}{2}$ in. wide by 87 in. high over all, constructed of $\frac{3}{8}$ in. by $\frac{3}{4}$ in. by $1\frac{1}{8}$ in. angles mitred at corners and beveled on inner edges.

(10) Front Frame—Steel plate 7 in. by $\frac{3}{8}$ in.

(11) Back Frame—Steel angles with removable steel bar.

(12) Bolts Outside Door—Twelve bolts of $\frac{1}{8}$ in. dia., double acting.

(13) Outer Bolt Frames—1 in. wide by $1\frac{5}{8}$ in. high.

(14) Inner Bolt Frames— $1\frac{1}{8}$ in. wide by $1\frac{5}{8}$ in. high.

(15) Locks—Two Diebold 3-tumbler combination locks with re-locking device.

(16) Bolt Throw Handle—A drop handle with steel knob and black bakelite grip.

(17) Crane Hinge—Semi-steel $5\frac{1}{2}$ in. wide by $1\frac{3}{8}$ in. thick. Hinge barrels are $2\frac{1}{4}$ in. and $2\frac{1}{2}$ in. dia.

(18) Compressor System—Single horizontal.

(19) Hand Wheel—Six spokes with black bakelite grips. Over-all diameter $16\frac{1}{4}$ in.

(20) Foot Bridge—None. Flush entrance into vault.

(21) Door Stop—A nickel plated door stop with rubber bumper is furnished for setting in the floor.

(22) Day Gate—A standard No. 7 Diebold Day Gate is furnished constructed of $\frac{1}{2}$ -in. rods set on $1\frac{3}{4}$ -in. centers through $\frac{1}{2}$ -in. by $1\frac{1}{2}$ -in. girts and provided with a self-closing hinge. The gate is furnished with a key lock operated with key from outside and thumb latch from inside. An alarm bell is attached to lock.

(23) Finish—Edge moulding is satin nickel; front of door and frame, jams, crane hinge and vestibule inside are olive green duco; compressor system, boltwork and day gate are buffed nickel; locks are satin bronze.

(24) Over-all Crated Size—2 ft. $11\frac{1}{2}$ in. deep by 7 ft. 4 in. high by 4 ft. 6 in. wide.

(25) Shipping Weight—3000 lb.

Note: Satin nickel finish plates can be furnished for the outside face of the door and frame, as an extra, when specified. The depth of the vestibule may be changed.

To Specify This Door Write—"Diebold Standard Style No. 215 Vault Door." Specify the swing of the door as right or left as you face it. The door illustrated is right swing.

No. 215 Burglar-resistive Vault Door—Closed

No. 215 Burglar-resistive Vault Door—Open

BURGLAR-RESISTIVE VAULT DOOR—STYLE NO. 235**Recommended Use**

Style No. 235 Burglar-resistive Vault Door is designed for vaults built for protection from burglarious attack. Burglary insurance premiums are substantially reduced since it meets the Class "E" Mercantile Burglary Insurance classification. It is recommended wherever this type of protection is required for securities or valuables.

Jewelers will find it profitable because of reduced insurance premiums; manufacturers, wholesalers, jobbers, and large retailers will find it desirable for the protection of valuable stock, formulas and payrolls.

It is ideal for banks and financial institutions needing a separate vault for the protection of accounts and records from fire and burglary. It will harmonize nicely with the main bank vault door.

Where additional burglary protection is required write for specifications of Diebold Bank Vault Doors.

Manufacturers' Specifications

- (1) **Clear Opening Into Vault**—32 in. wide by 78 in. high.
- (2) **Over-all Door Thicknesses**—The door is $8\frac{1}{4}$ in. thick on edge and measures $14\frac{3}{8}$ in. over compressor system.
- (3) **Door Construction**—The solid steel thickness of the door is $3\frac{1}{2}$ in. built up of $\frac{1}{2}$ in. open hearth 2 in. torch resisting, $\frac{1}{2}$ in. 5-ply chrome, and $\frac{1}{2}$ in. open hearth plates.
- (4) **Masonry Opening**—40 in. wide by $84\frac{1}{2}$ in. high. Notice floor levels.

- (5) **Wall Thickness**—20 in. including finish. If steel lining is to be attached to door write for special masonry drawing.

- (6) **Extreme Swing of Door**— $42\frac{1}{8}$ in.

- (7) **Vestibule Body Over All**—The vestibule body is constructed of $\frac{1}{4}$ -in. open hearth plates with 2 in. by 2 in. by $\frac{1}{4}$ in. angles at the corners. It is $37\frac{3}{4}$ in. wide by $82\frac{3}{8}$ in. high.

SAFE DEPOSIT AND BOND BOXES

From the following information, together with the sketch, can be figured the number of safe deposit boxes or bond boxes, or any combination of both that will fit any given size space.

Formula for figuring the total number of boxes of average sizes in a given space: Multiply height in feet by the width in feet of the available space, and then by $6\frac{3}{4}$. This will give you the total number of boxes of average size.

Note: For computing size of sections, figure all verticals $\frac{3}{8}$ in., including the outside shell. Figure the horizontals $\frac{1}{8}$ in., except top and bottom of sections which are $\frac{1}{4}$ in.

Comparison of Circular and Rectangular Doors

The illustrations below show two characteristic Diebold Vault Door installations. Both doors, the one circular, the other rectangular, afford the same protection to the bank's vault. Both are massive, impressive and beautiful. Our purpose in showing these two doors is to accord you an opportunity of making a fair comparison. Each harmonizes with appro-

prate types of bank design. The rectangular door occupies a minimum of space and is particularly desirable where space is at a premium. Where sufficient space is available at the proper location the circular door makes an unusually fine showing. Naturally, preference will be based on the surrounding conditions.

WALL SAFE**Purpose**

The wall safe is designed for the protection of papers and valuables from fire and theft.

The business man carries papers, documents and securities home that are religiously kept in the safe at the office. He needs a safe at home.

The lady of the house needs protection for jewelry, drugs, silverware, heirlooms and countless articles kept in the home that could not be replaced if lost.

This safe is especially adapted to installation in apartments and private residences. As standard equipment in large apartment buildings, it has powerful appeal for prospective renters.

Manufacturer's Specifications

Outside Dimensions—10½ in. high by 15 in. wide by 8 in. deep.

Inside Dimensions—9½ in. high by 14 in. wide by 7 in. deep.

Shipping Weight—100 lb.

Card Capacity—4800 to 15,000, depending upon size of card. In ordering card trays, height and width of card must be specified. 10 in. is maximum height of card, exclusive of index.

ESTABLISHED 1872

THE SCHWAB SAFE COMPANY

Manufacturers of Vault Doors, Safes and Burglarproof Chests

LAFAYETTE, IND.

Products

VAULT DOORS, SAFES, FILING SAFES, FUR SAFES, WALL SAFES and BURGLARPROOF CHESTS.

The Company

THE SCHWAB SAFE COMPANY has been building quality safes for more than 58 years. We have a very modern up-to-date plant with all modern manufacturing facilities.

Engineering Staff

We maintain a most competent staff of engineers to assist you with any problems within our scope.

Literature

Upon request we will gladly send you a copy of our latest Vault Door Catalogue which has been prepared especially for the file, indexed A.I.A. File 18g. This catalogue gives complete architects' and engineers'

specifications as well as vault construction data.

Schwab Insulated Vault Doors (Underwriters' 2-Hour Label) See Page 2 for Specifications

Specified where *maximum fire protection is required.*

Schwab's 2-hour Vault Doors have a wide extra margin of safety—the equivalent to approximately a 3½-hour door. No greater protection will *ever* be needed. The strain on a vault door, where only one side is exposed to the fire and heat, is not nearly so great as on a safe where all four sides are exposed. And on an insulated safe, a 4-hour label at 2000° is maximum.

Both the No. 2674B (single door) and the No. 3674B (double door) are of the new type, with interlocking tongue and groove, insulated doors and jambs.

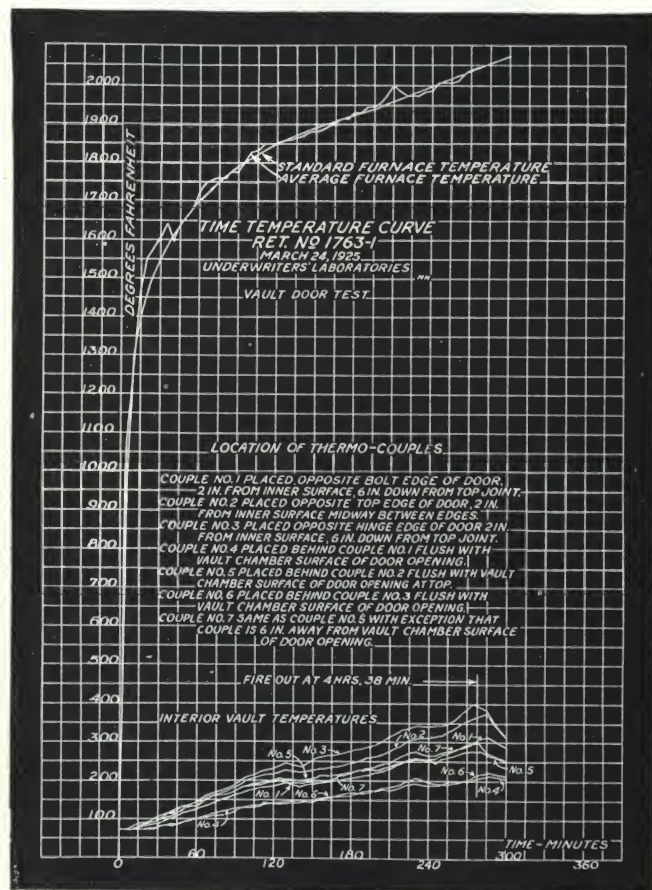

UNDERWRITERS' TEST OF SCHWAB INSULATED VAULT DOORS

Contents Preserved Intact During Furnace Test That Lasted Over Twice the Time Required

While our vault doors are classed as two-hour fire-retardant doors, they actually preserve their contents without the slightest injury during a severe fire test lasting four hours and thirty-eight minutes. This performance shows a wide margin of safety—132% over the requirements for this test.

TABULATION OF TEMPERATURES SHOWN ON HEAT CHART

278 min. (4 hrs. and 38 min.).....	276	2050

The Underwriters' Laboratories, in their report to us, advised as follows:

"The furnace fire was extinguished at 4 hours 38 minutes. The contents of the vault chamber and the papers on the shelves of the panel remained intact and were practically unaffected as a result of the test, no brittleness or lack of legibility being noted."

UNDERWRITERS' 2-HOUR LABEL INSULATED VAULT DOOR NO. 2674B (SINGLE) AND NO. 3674 (DOUBLE)

Details on Page 6

Specifications

Dimensions—No. 2674B: Clear opening through vestibule 74 in. high, 26½ in. wide, 18 in. deep. Vault wall opening 85½ in. high, 39 in. wide, 18 in. deep.

Dimensions—No. 3674B: Same as No. 2674B, except clear opening through vestibule 36½ in. wide and wall opening 49 in. wide.

Note: Wall opening must be at least 10 in. deep to permit Underwriters' label on door.

Materials and Construction—Sides, top and bottom No. 12 gauge bessemer, with No. 12 gauge inner lining in vestibule built on solid angle frame 1¼x1¼x¼ in. continuous around all edges. Front frame 3x1½ in. Rear 5½x1½ in. open hearth steel. Outer door plate No. 10 gauge rerolled bessemer. Inner plate of door No. 16 gauge. No. 16 gauge drawn steel door and frame jambs with interlocking tongue-and-groove flanges. Door ¼ in. on edge, 1¼x1¼x1½ in. angle bolt frame, solid welded at all corners continuous around door. Center bolt bars 1½x¾ in. cold rolled steel. Lock rail 4x¼ in. Hinged foot bridge ¼ in. Diamond Shure-Step steel. 3½ in. approved fireproof insulation in door and 5 in. in frame jambs. The back sill bars shall be removable to allow vault door to be installed after the walls are up.

Bolt Work—Outside door shall be locked by ten double acting bolts, all ¾ in. in diameter, cold rolled steel, operating four front, four back, one up and one down, and working through a solid steel angle bolt frame 1¼x1¼x1½ in. at edges of door and through 1½x¾ in. center bolt bar. Bolts shall be checked by four-tumbler brushed bronze finish combination lock and thrown by heavy brushed bronze finish drop handle with black grip. On No. 3674B, bolt work is thrown by two drop handles.

Note: Inside doors not required by Underwriters' Laboratories, Inc. Day gate complete with lock and alarm bell can be furnished at reasonable extra charge.

Finish—Olive green lacquer, neatly striped and ornamented.

Weight—No. 2674B approximately 1750 lb. No. 3674B approximately 2350 lb.

UNDERWRITERS' INSULATED VAULT DOOR NO. 2774R

Details on Page 6

Specifications

Dimensions—Clear opening through vestibule 74 in. high, 27 in. wide. Vault wall opening 77 in. high, 32 in. wide, 6 in. deep.

Note: The maximum net opening to which this door can be built if label is required is 32 in. wide, 78½ in. high, 6 in. or more in depth. Without label, door can be built any reasonable size.

Materials and Construction—Sides and top No. 16 gauge; bottom No. 12 gauge bessemer. Front frame 3½x1½ in.; rear 3½x1½ in. Bottom sill bars, open hearth steel; front 1¼x¼ in.; rear 1¼x¼ in.

Outer door plate No. 10 gauge rerolled bessemer, reinforced at edge by 1½x2x1½ in. steel angle frame solid welded at all corners (door approximately ¾ in. thick on edge). Attached to the 2 in. angle shall be an asbestos insulation sheet covered by a No. 16 gauge steel cover plate forming a 1¼ in. air space between the inner and outer door plate.

The back sill bars shall be removable to allow vault door to be installed after the vault walls are up.

Bolt Work—Outside door shall be locked by three cross-bolts, one up and one down bolt, all 1 in. diameter, cold rolled steel, operating through solid steel angle iron bolt frame 1½x2x1½ in. continuous around sides, top and bottom of door. Bolts shall be checked by four-tumbler combination lock, having black dial and white numerals, and thrown by heavy nickelplated drop handle with black grip.

Door Swing—Door shall swing to the (right) (left).

Note: Specify swing, otherwise furnished to swing to right.

Note: No inside doors are intended for this vault door, but can be provided, at additional cost, if specified, and to pocket into vestibule if vestibule is 16 in. or more deep; if less, can be swung back into vault or out through door opening.

Finish—Olive green lacquer, neatly striped and ornamented.

Weight—Approximately 575 lb.

**SCHWAB STANDARD VAULT DOOR NO. 10***Details on Page 6***Specifications**

Dimensions—Clear openings through vestibule 74 in. high, 25 in. wide. Vault wall opening 77 in. high, 32 in. wide, 18 in. deep.

Note: Inside doors will pocket in a vestibule 16 in. or more deep.

Materials and Construction—Sides and top No. 16 gauge, bottom No. 12 gauge bessemer. Front frame $3\frac{1}{2} \times \frac{3}{8}$ in. open-hearth steel bars; rear $3\frac{1}{2} \times \frac{3}{8}$ in. open-hearth steel bars. Bottom sill bars, front $1\frac{3}{4} \times \frac{1}{4}$ in.; rear $1\frac{1}{4} \times \frac{1}{4}$ in. open-hearth steel.

Outer door plate No. 10 gauge rerolled bessemer sheet steel reinforced at edge by $1\frac{1}{2} \times 2 \times \frac{3}{8}$ in. steel angle frame solid welded at all corners. (Door approximately $\frac{3}{8}$ in. thick on edge.)

The back sill bars shall be removable, to allow vault door to be installed after the vault walls are up.

Bolt Work—Outside door shall be locked by three cross-bolts, all 1 in. diameter, cold rolled steel, operating through solid steel angle iron bolt frame $1\frac{1}{2} \times 2 \times \frac{3}{8}$ in. continuous around sides, top and bottom of door. Bolts shall be checked by four-tumbler combination lock, having black dial and white numerals and thrown by heavy nickel-plated drop handle with black grip.

Door Swing—Door shall swing to the (right) (left).

Note: Specify swing, otherwise furnished to swing to right.

Inside Doors—The inside doors shall be No. 8 gauge open-hearth steel hung on pin hinges, and open into the vestibule. They shall be locked by flat up and down bolts on right-hand door and checked by key lock.

Note: May be specified to open into the vault.

Finish—Olive green lacquer, neatly striped and ornamented.

Weight—Approximately 580 lb.

**SCHWAB STANDARD VAULT DOOR NO. 20***Details on Page 6***Specifications**

Dimensions—Clear opening through vestibule 74 in. high, 25 in. wide. Vault wall opening 77 in. high, 32 in. wide, 18 in. deep.

Note: Inside doors will pocket in a vestibule 16 in. or more deep.

Materials and Construction—Sides and top No. 16 gauge, bottom No. 12 gauge bessemer. Front frame $3\frac{1}{2} \times \frac{3}{8}$ in. open-hearth steel bars; rear $3\frac{1}{2} \times \frac{3}{8}$ in. open-hearth steel bars. Bottom sill bars, front $1\frac{3}{4} \times \frac{1}{4}$ in.; rear $1\frac{1}{4} \times \frac{1}{4}$ in. open-hearth steel.

Outer door plate No. 10 gauge rerolled bessemer sheet steel reinforced at edge by $1\frac{1}{2} \times 2 \times \frac{3}{8}$ in. steel angle frame solid welded at all corners. (Door approximately $\frac{3}{8}$ in. thick on edge.)

The back sill bars shall be removable, to allow vault door to be installed after the vault walls are up.

Bolt Work—Outside door shall be locked by four cross-bolts, one up and one down bolt, 1 in. diameter cold rolled steel, operating through solid steel angle iron bolt frame $1\frac{1}{2} \times 2 \times \frac{3}{8}$ in. continuous around sides, top and bottom of door. Bolts shall be checked by four tumbler combination lock, having black dial and white numerals and thrown by heavy nickel-plated drop handle with black grip.

Door Swing—Door shall swing to the (right) (left).

Note: Specify swing, otherwise furnished to swing to right.

Inside Doors—The inside doors shall be No. 8 gauge open-hearth steel hung on pin hinges, and open into the vestibule. They shall be locked by flat up and down bolts on right-hand door and checked by key lock.

Note: May be specified to open into the vault.

Finish—Olive green lacquer, neatly striped and ornamented.

Weight—Approximately 620 lbs.

**SCHWAB STANDARD VAULT DOOR NO. 19***Details on Page 6***Specifications**

Dimensions—Clear opening through vestibule 74 in. high, 25 in. wide. Vault wall opening 77 in. high, 32 in. wide, 18 in. deep.

Note: Inside doors will pocket in a vestibule 16 in. or more deep.

Materials and Construction—Sides and top No. 16 gauge, bottom No. 12 gauge bessemer. Front frame $3\frac{1}{2} \times \frac{3}{8}$ in. open-hearth steel bars. Rear frame $3\frac{1}{2} \times \frac{3}{8}$ in. open-hearth steel bars. Bottom sill bars open-hearth steel bars. Front $1\frac{3}{4} \times \frac{1}{4}$ in. Rear $1\frac{1}{4} \times \frac{1}{4}$ in.

Outer door plate $\frac{3}{8}$ -in. open-hearth steel, reinforced on sides, top and bottom by $2 \times \frac{1}{4}$ -in. bars solid welded at all corners. (Door $\frac{3}{8}$ in. thick on edge.)

The back sill bars shall be removable to allow the vault door to be installed after the vault walls are up.

Bolt Work—The outside door shall be locked by four cross-bolts and one up and one down bolt, 1 in. in diameter, cold rolled steel, operating through solid steel bar frame $1\frac{3}{4} \times \frac{3}{4}$ in. continuous around sides, top and bottom of door. Bolts shall be checked by four-tumbler combination lock, having black dial and white numerals and thrown by heavy nickel-plated drop handle with black grip.

Door Swing—Door shall swing to the (right) (left).

Note: Specify swing, otherwise furnished to swing to right.

Inside Doors—The inside doors shall be 8-gauge open-hearth steel hung on pin hinges, and open into the vestibule. They shall be locked by flat up and down bolts on right-hand door and checked by key lock.

Note: May be specified to open into the vault.

Finish—Olive green lacquer, neatly striped and ornamented.

Weight—Approximately 700 lb.

**SCHWAB STANDARD VAULT DOOR NO. 21***Details on Page 6***Specifications**

Dimensions—Clear opening through vestibule 74 in. high, 25 in. wide. Vault wall opening 77 in. high, 32 in. wide, 18 in. deep.

SCHWAB WALL SAFE NO. 10

Purpose

Security for family treasures against fire and theft.

For Homes, Apartments, etc.

Our wall safe is the ideal method of providing security for the treasures, heirlooms, valuables and money which every family has. It provides protection against fire and theft without involving the necessity of going to and from a safety deposit box in a bank every time the things it contains are needed.

Complete Fire Protection

Our No. 10 wall safe is built into the solid masonry of an outside wall or chimney, where the wall protects the sides, the rear, the top and the bottom. The door and the front of the safe are heavily insulated. Thus, no matter how severe the fire, valuables kept in one of our wall safes will be securely preserved.

Maximum Theft Protection

A heavy, three-tumbler lock; hardened rolled steel door plate; doors closely fitted; drillproof steel plate protecting a trigger relocking device to protect contents against an attempted burglary—all these features make entrance difficult for even highly skilled cracksmen. Our wall safe is as nearly burglarproof

bedroom is an added convenience to the mistress, where she may have ready access to jewels, trinkets, etc.

Schwab No. 10 Wall Safe
(Phantom View)

Detail of No. 10 Wall Safe

as it can be made without becoming too heavy and cumbersome. Its sturdy construction makes it easy to install; its service is measured only by the life of the wall in which it is placed. Its use secures a substantial reduction in insurance against home robbery.

Installation

In apartment houses or other structures built of brick, the safe may be placed in the wall at any convenient location, preferably the bedroom. It must be borne in mind, however, that in making these installations the safe must be entirely surrounded by masonry and resting on a secure foundation that extends to the ground. The Schwab Wall Safe has been specifically designed for this wall installation.

In frame structures, the broad brick or stone fireplace is the logical location. Care must be taken, of course, to see that sufficient masonry surrounds the safe to obviate heating it, when the fireplace is in use (which, in modern homes, with a regular heating system, is seldom). The safe may be installed above the mantel and concealed by a picture, or it may be placed on one of the sides providing there is sufficient room.

In apartments, a Schwab Wall Safe placed in the

SCHWAB NO. 145 HOME FUR AND GARMENT CLOSET

For Modern Homes and Apartments

No doubt many modern structures and their accessories are materially affected and dominated by modern American women. Is it not possible that these same women are just as greatly interested in the convenience and protection afforded their coats and gowns?

Most any woman would prefer a cedar lined fur and garment closet equipped with the newest type sliding extension hanger as compared to the ordinary clothes closet.

These steel closets can be built to any reasonable size and can be installed in any wall opening of equivalent size and if desired entirely hidden from plain view by a regular closet door. Where such is desired, Schwab Fur and Garment Closets can be built to permit a drawer in the bottom and with hat storage space above the hanger.

The cost of these steel closets, equipped with high grade safe combination locks, is slightly less than to build the newest type regular clothes closet and at the same time affords far greater protection against fire and theft, and is cedar lined as a protection against moth.

Open View Fur and Garment Closet No. 145

Construction

Body—12 gauge jacket, riveted to 2x2x¼ in. angle iron. Interior of body is lined with ¾ in. cedar so placed as to give an air space between cedar and steel jacket. This air space is ¾ in. on top, ½ in. on bottom and ½ in. on back and sides. Body is carried on four solid castors so placed as to roll from front to rear, permitting easy passage through standard doors. 36 in. sliding hanger, top center.

Doors—Consists of 10 gauge plate steel securely riveted to 2x2x¼ in. angle iron which makes door ¾ in. on edge. Door is locked by two cross-bolts and one up and one down bolt. Bolts are controlled by heavily nickelplated drop handle with black grip and stopped by a four-tumbler combination lock with black dial and white numbers. Door is swung on three plain pin hinges.

Finish—The standard finish on these safes is a pleasing French gray lacquer, gold striped with neat design. Nickel hinge tips set off the front of the safe.

THE COMPANY, ITS PRODUCTS AND SERVICE

This company manufactures a complete and comprehensive line of bank vaults, fire resistive vault doors, filing safes classes A and B, burglarproof chests, night depositories and other like equipment. Suggestive features are detailed on the following pages.

Information about design, construction and costs will be furnished to architects without entailing any obligation for such service as may be involved.

For nearly a century the HERRING-HALL-MARVIN SAFE Co. has built into its product the same undeviating quality.

FIREPROOF VAULT DOORS

No. 7830—Six Hour Label

Certified six hour label vault door No. 7830 passed the test of the Underwriters' Laboratories, Inc., with application of heat for six hours up to 2140 degrees. The door was set in the wall of a small vault with a furnace compartment immediately in front. Thermocouples for recording the heat in the vault were placed two inches from the door. The highest temperature

**No. 7830**

recorded on any of these couples was 238 degrees, which is 62 below the Laboratories' requirement.

A second part of this test was performed on another door which was heated under similar conditions for three hours. The furnace was then shut off and a stream of water under high pressure was driven from the nozzle of a fire hose against the red hot door. Heat was again applied for three hours. The highest temperature behind the door during this stage of the test was 230 degrees.

This insulated vault entrance is made with steel jambs, and represents the best and newest developments in fire-resistive construction. It is built like the doors and jambs of the Herring-Hall-Marvin Class A Safe.

**Vertical Section Showing Masonry Plan**

Manufacturer's Specifications—Trim, 88½ in. high by 45½ in. wide; clear opening through vestibule, 78 in. high by 30 in. wide. Dimensions and shape of required wall opening are shown on sectional drawings.

This door will be furnished in greater widths if required.

The door is locked by means of six bolts ⅞-in. diam., and by the interlocking flange at the back. The lock and its connections are protected by a drill proof plate.

The jambs are built with two flanges with tenon and groove at top, front and bottom, and interlocking flange with spring seal at rear.

A hinged never-slip foot bridge with incline is furnished. Shipping weight, approximately 1650 lb.

Printed instructions for setting are furnished with all doors, and if requested will be sent on receipt of order.

**Horizontal Section, Showing Masonry Plan**

A—tenon and groove; B—interlocking flange; C—spring seal; D—fireproof filling; E—handle arbor; F—carrying bar; G—slide bar; H—lock arbor or spindle; I—lock plate; J—combination lock; K—drill proof plate; L—moulding bars. XX—spaces to be filled with cement grout after vault entrance is in position

MINIMUM WALL THICKNESSES FOR SIX HOUR VAULTS AS SPECIFIED BY NATIONAL FIRE PROTECTION ASSOCIATION

7th			12	16
8th			12	16
9th			12	16
10th			14	16

These specifications apply to ground supported vaults whose construction is independent of the building in which they are located. Wall thicknesses of structural supported vaults that are supported by the framework of buildings of fire-resistive construction must not be less than those specified for the top stories of ground supported vaults.

No. 7629—Two Hour Label

Certified two hour label vault door No. 7629 passed the test of the Underwriters' Laboratories, Inc., with application of heat for two hours up to 1850 degrees. The test was similar to that of vault door No. 7830.

**No. 7629**

The highest temperature back of the door was 170 degrees, 130 degrees below the Laboratories' requirement.

In the second part of the test, the door was exposed for one hour to heat up to 1700 degrees. After the furnace had been shut off and a stream of water from a fire hose had been applied to the red hot door, furnace heat was again applied for one hour up to the same maximum. The highest temperature reached back of the door was 190 degrees.

Manufacturer's Specifications

—Trim, 84 $\frac{1}{8}$ in. high by 41 $\frac{1}{8}$ in. wide; clear opening through vestibule, 76 in. high by 29 in. wide. Dimensions and shape of required wall opening are shown on sectional drawings.

This door will be furnished in greater widths if required.

The door is locked by means of six bolts $\frac{3}{4}$ -in. diam., and by the interlocking flange at the back. The lock and its connection are protected by a drillproof plate.

The jambs are built with two flanges with tenon and groove at top, front and bottom, and interlocking flange with spring seal at rear.

A hinged never-slip foot bridge with incline is furnished.

Shipping weight, approximately 1350 lb.

Printed instructions for setting are furnished with all doors, and if requested will be sent on receipt of order.

MINIMUM WALL THICKNESSES FOR TWO HOUR VAULTS AS SPECIFIED BY NATIONAL FIRE PROTECTION ASSOCIATION

Number of stories counting from top down	Reinforced concrete	Brick	Hollow clay tile or concrete block	Protected steel or reinforced concrete frames		
				Reinforced concrete panels	Brick or plain concrete panels	Hollow Clay tile or concrete block panels
Top	6	8	12	6	8	12
2nd	8	12	12	8	12	12
3rd	10	12	16	10	12	16
4th	10	16	20	10	12	16
5th	12	16		12	16	20
6th	12	16		12	16	20
7th				12	16	20
8th				12	16	20
9th				12	16	20
10th				12	16	20

These specifications apply to all ground supported vaults whose construction is independent of the building in which they are located. Wall thicknesses of structural supported vaults that are supported by the frame work of buildings of fire resistive construction must not be less than those specified for the top stories of ground supported vaults, except that the minimum thicknesses of walls of hollow clay tile or concrete block for a two-hour vault may be 8 in.

Fireproof Doors with Vestibules

Vault doors No. 14, 17, 19, 20, 21, 22 and 25 are equipped with a special relocking device with the inspection label of the Underwriters' Laboratories, Inc. A discount of 10 per cent is allowed from all premiums on burglary insurance covering the contents of vaults where these doors are used.

Nos. 20, 21 and 22 have interlocking back flange.

Manufacturer's Specifications—No. 22—Trim, 83 $\frac{1}{4}$ in. high, 38 $\frac{1}{2}$ in. wide. Wall opening required, 81 $\frac{1}{2}$ in. high, 34 $\frac{1}{2}$ in. wide, 20 in. deep. Clear opening through vestibule 77 $\frac{3}{4}$ in. high, 29 in. wide. Inside doors pocket in vestibule 17 $\frac{3}{4}$ in. deep. Twelve bolts, 1-in. diam., locking through solid bolt frame on sides, top and bottom and through center of door, and checked by four tumbler combination lock.

No. 21—Same as No. 22 excepting bolt work. Six bolts, 1-in. diam., locking at ten points through solid bolt frame.

No. 20—Same as Nos. 22 and 21 excepting that bolt work operates through angle bolt frame.

No. 20

No. 22

No. 17—Trim, 80 $\frac{5}{8}$ in. high, 35 $\frac{5}{8}$ in. wide. Wall opening required, 79 in. high, 32 in. wide, 20 in. deep. Clear opening through vestibule, 75 $\frac{1}{2}$ in. high, 26 $\frac{1}{2}$ in. wide. Inside doors pocket in vestibule 16 $\frac{1}{4}$ in. deep. Five bolts, 1-in. diam., locking at eight points through angle bolt frame and checked by four tumbler combination lock.

No. 19—Same as No. 17 excepting bolt work. Three bolts, 1-in. diam., locking at six points through angle bolt frame.

No. 18—Trim, 80 $\frac{5}{8}$ in. high, 31 $\frac{5}{8}$ in. wide. Wall opening required, 79 in. high, 28 in. wide, 20 in. deep. Clear opening through vestibule, 75 $\frac{1}{2}$ in. high, 22 $\frac{1}{2}$ in. wide. Inside doors will pocket in vestibule 14 $\frac{1}{4}$ in. deep. Outer door locked at three points by flat up and down bolts and by short horizontal bolt at center, checked by four tumbler combination lock.

No. 14—Trim, 83 $\frac{1}{4}$ in. high, 49 in. wide. Wall opening required 81 $\frac{1}{2}$ in. high, 44 in. wide, 20 in. deep. Clear opening through vestibule, 76 $\frac{3}{4}$ in. high, 36 $\frac{1}{2}$ in. wide. Inside doors will pocket if vestibule is increased to 22 $\frac{1}{2}$ in. depth—this will increase clear width of opening through vestibule to 38 $\frac{1}{2}$ in. Bolts, 1 in. diam., locking each door through solid bolt frames.

No. 17

No. 14

Typical Construction of Fire Resistive Vestibule Doors

No. 63—Half Hour Label

This vault door is intended for use in record rooms and carries the $\frac{1}{2}$ hour label of the Underwriters' Laboratories, Inc. It is furnished with or without inside

No. 63

Horizontal Section, Showing Masonry Plan

Vertical Section
Showing Masonry
Plan

doors and with vestibule 6 in. or more in depth according to the thickness of the wall.

Manufacturer's Specifications—Trim $81\frac{1}{2}$ in. high, $37\frac{1}{2}$ in. wide. Wall opening required $78\frac{1}{2}$ in. high, $32\frac{1}{2}$ in. wide. Clear opening through vestibule $76\frac{1}{2}$ in. high, $28\frac{3}{4}$ in. wide.

This door will be furnished with label with clear opening up to 32 in. wide.

Four bolts $\frac{7}{8}$ in. diam. at front with interlocking flange at rear of door. Insulated steel cover plate over bolt work. Bolt work checked by four tumbler combination lock.

Inside doors, when used, pocket in vestibule 18 in. deep. Clear opening through inside doors, $27\frac{1}{2}$ in.

Horizontal and vertical sections of this door are shown without inside doors. These sections also give the dimensions of wall openings.

No. 62

This vault door is intended for use in tile, brick or light concrete walls. It is furnished with or without inside doors and is of approximately similar construction and slightly smaller than No. 63.

Planning for Vault Doors

Printed drawings showing the masonry openings for all vault doors will be furnished promptly upon request either directly by the company or through its representatives in over three hundred cities.

Height, width and depth of vestibule doors can be changed to meet special requirements. Insulated doors can be built special height and width, but otherwise in accordance with the specifications of Nos. 7830 and 7629. Insulated doors can also be built with vestibules and inside doors if required. In requesting quotations on either standard or special doors, please send full information concerning height, width and depth of wall opening available and the clear height and width required for passage through the vestibule.

Fur Vault Doors

These doors have been specially designed to meet the burglary insurance requirements for Class E and Class D vaults respectively.

Manufacturer's Specifications—No. 697—This door is of solid steel 3 in. in thickness. Outside dimensions of vestibule, 80 in. high, 32 in. wide, $13\frac{3}{4}$ in. deep for a finished concrete wall $12\frac{3}{4}$ in. thick. Clear opening, 78 in. high, 30 in. wide. When used in reinforced concrete wall 12 in. thick or with $\frac{1}{2}$ -in. steel lining this door meets the requirements of the current insurance manual for a class E mercantile rating.

The door is locked in position by means of eight bolts, $1\frac{1}{4}$ -in. diam., and by three locking dogs at the rear. Bolts checked by one 4-tumbler combination lock with relocking device, certified by Underwriters' Laboratories, Inc.—10% deduction from burglary insurance premiums for this device. Door hung on ball bearing pin hinges with pressure handle at front. Weight, 3270 lb.

Vestibule may be fitted with polished or nickel plated moulding bars. Inside doors will be furnished if required.

Fur Vault Door for Mercantile Uses

Depth of vestibule and height and width of door may be varied as required.

No. 696—This door is like No. 697 except in the following particulars: solid thickness of steel, $1\frac{1}{2}$ in.; bolts, $1\frac{1}{8}$ -in. diam.; weight, 2200 lb. Built for 9-in. wall with class D rating.

Light Doors with Crane Hinges

These doors may be furnished without extra cost with the certified relocking device.

Manufacturer's Specifications—No. 24—Trim, $87\frac{3}{8}$ in. high, $48\frac{1}{4}$ in. wide. Wall opening required, $81\frac{3}{4}$ in. high, $37\frac{1}{4}$ in. wide, 20 in. deep. Clear opening through vestibule, $77\frac{1}{2}$ in. high, $31\frac{1}{4}$ in. wide. Inside doors will pocket in vestibule 19 in. deep. Thickness of door plate, $\frac{1}{2}$ in. Twelve bolts, $1\frac{1}{4}$ -in. diam., as shown in illustration. Removable back bars. Weight, 1730 lb. Door hung on gooseneck crane hinge with single horizontal pressure system, 6-spoke pilot wheel. Moulding bars, $4\frac{7}{8}$ in. wide.

No. 24

No. 25—Trim, 83½ in. high, 38½ in. wide. Wall opening, 81½ in. high, 34 in. wide, 20 in. deep. Clear opening through vestibule, 78½ in. high, 28½ in. wide. Inside doors will pocket in vestibule 18 in. deep. Thickness of door plate ½ in. Bolt work similar to No. 22. Weight, 1200 lb. Door hung on goose-neck crane hinge with single horizontal pressure system, rim wheel. Architrave if required.

Majestic No. 1—Trim, 87 in. high, 50¼ in. wide. Wall opening, 79 in. high, 34 in. wide, 20 in. deep. Clear opening through vestibule, 74¾ in. high, 28½ in. wide. Inside doors will pocket in vestibule 18 in. deep. Thickness of door plate

½ in. with ½-in. panel bars, making door 1 in. thick on edge. Bolt work similar to No. 24. Finish plate under bolt work; hinged glass door over same. Door hung on built up crane hinge with single horizontal pressure system, 4-spoke pilot wheel. Moulding bars, 5½ in. Weight, 1820 lb.

No. 27—This door is similar to No. 25 except that it is fitted with 5½-in. moulding bars, double horizontal pressure system, day gate, finish plate under bolt work, hinged glass door over bolt work. Weight, 2035 lb. Back bars on all doors of this type are removable.

BANK VAULTS AND EQUIPMENT

The Sales Engineering Department will furnish the fullest co-operation in the way of drawings, plans, cost data and other valuable information to architects who are planning bank work.

Vault equipment is designed to meet the individual requirements of banks, and, therefore, is not cataloged.

Seven Inch Door

A careful study will be made in each case and plans will be submitted showing the dimensions and layout of vaults of every description, the construction of circular or rectangular vault doors, the arrangement and layout of safe deposit boxes and steel lockers, and full details concerning partitions, grilles, paneled ceilings and walls, and other requirements of the finished vaults of a modern bank.

Vault doors are built to resist successfully every known method of attack, especially by cutting torch or high explosive. Design, materials and methods of construction are based on thorough scientific research coupled with the experience of nearly a century of successful manufacture.

Herring-Hall-Marvin builds either doors of the single flange type, or stepped doors with more than

Another Typical Heavy Door

The work of the Herring-Hall-Marvin factory is characterized not only by care in fabrication and precision in fit of parts but also by outstanding excellence of finish.

The interlocking cast vestibule, developed by the HERRING-HALL-MARVIN SAFE Co., is a marked advance in engineering design over the older or box type. This vestibule is formed of a heavy channel shaped casting with wide ribs. The horizontal steel reinforcing rods of the wall are brought to within the flanges and ribs of the casting and return stirrups, passed through the casting, tie the vault entrance immovably into the concrete so that the vestibule becomes an integral part of the wall construction itself thus gaining great strength and rigidity, and reducing the width and height of the necessary opening through the concrete defense of the vault. The complete bond between the vestibule and the walls of the vault is illustrated below.

Interlocking Type

one flange. The relative appearance of these is indicated in the reproductions of actual installations shown on this page and on the first page of this section.

NIGHT DEPOSITORIES

The Rotary Night Depository consists of the following:

(1) A cast manganese bronze cylinder and housing which may be set either in the outside wall of the bank, or in the entrance lobby, or at any other convenient point.

(2) A heavy steel chute of ample size through which the bag is dropped from the cylinder entrance to the night safe inside the building. The inside of this chute contains a series of serrated baffles which will effectually prevent the withdrawal of any object. A hinged baffle door is located at the bottom of the chute.

(3) The night safe, which will be made of any size to meet the needs of the user.

The entrance cylinder and housing are of torch-proof manganese bronze. The cylinder is rotated by the opening of a bronze door on the face plate, and both cylinder and door are checked by a drillproof paracentric key lock.

Citizens Trust, Schenectady, N. Y.

The safe is made 1 in. in thickness to comply with the requirements for a class B insurance rating, and both safe and chute are required to be incased in reinforced concrete. The cast steel front of the safe and the circular cast steel door are drillproof, and are $3\frac{1}{2}$ in. in net thickness.

Insurance Rating

This safe is constructed throughout to take the Class B insurance rating, which is the best accorded to devices of this kind. The following paragraph is quoted from the Current Insurance Manual:

"Safe and chute are incased on all sides with at least 6 in. of concrete, reinforced with steel rods at least $\frac{5}{8}$ in. thick and spaced not more than 4 in. on centers. Reinforcing rods along chute are held in place by angle irons properly spaced."

By varying the length and direction of the chute it can be adapted to existing buildings and can be so placed as to be easy of access.

Dimensions—The following dimensions of head and chute are of special interest in planning for the installation of a Herring-Hall-Marvin Rotary Depository: Bronze face plate 21 in. wide, 16 in. high; depth of cylinder housing back of face plate $11\frac{1}{2}$ in.; total diameter of cylinder housing 14 in.; width of cylinder housing including studs 16

in.; outside width of chute 13 in.; outside thickness of chute from front to back $6\frac{1}{2}$ in. The chute should be set at an angle of not more than 30 degrees from the perpendicular. The safe should be so placed as to secure the greatest possible length of chute. The door may be located as required on the safe so that a portion of the safe may be set into the banking room floor in order to secure the desired length of chute.

Accessories

Canvas bags with zipper tops and Yale paracentric key padlocks are supplied in quality as desired.

Bronze electric light housing with glass front may be substituted for name plate.

Auxiliary door, as shown on illustration, will be supplied if required. This door insures against the possibility of bags being deposited and left in the cylinder, as the cylinder must be clear and the door closed before key can be withdrawn.

Electric protection for connection with the bank's burglar alarm system.

Simplex Depository

The Simplex Night Depository is designed to meet the demand for a low priced device. It consists of a bronze casting with a door of the same material, hinged at its lower edge and opening outward. To this door is attached a receptacle which rotates in such manner that the chute beneath it is

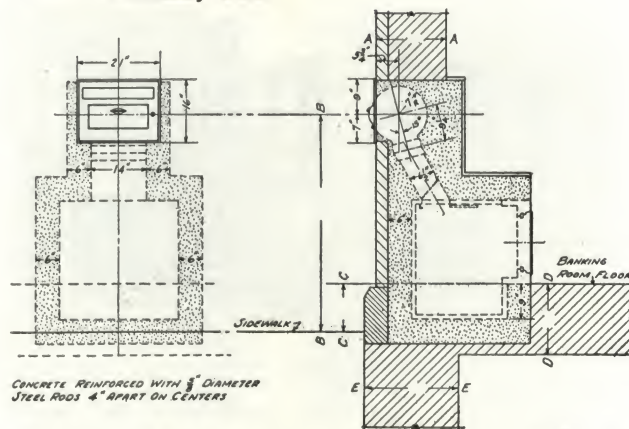

National City Bank, New York, N. Y.

Auxiliary Door

always closed to access from without. The chute connects with a burglarproof safe inside the bank in the same manner as that described for the Rotary Depository. The face of the door is illuminated at night.

Projection of Street Level Installation of Rotary Showing Dimensions Required

CERTIFIED FIREPROOF FILING SAFES

In the heat endurance test of the Underwriters' Laboratories, Inc., the Herring-Hall-Marvin Class A Safe was exposed to a continuous increasing furnace temperature which reached 2100 degrees at the end of 5¼ hours. The exposure period in this test was 75 minutes longer than the time required in the test for the A label, and the temperature reached was 100 degrees higher, indicating a demonstrated superiority of over 37% in resistance to heat beyond the extreme requirement for the label. The inside temperature of

Filing Safe—Class A and T-20 Labels

the safe tested in this case reached 300 degrees only at the expiration of the 5¼ hour period.

Fifteen sizes carry the A label, of which eleven are built with double doors and four with single doors.

Twelve sizes carry the B label; five with double doors and seven with single doors.

A group of portable vaults and small safes for commercial and residence use is also listed.

Herring-Hall - Marvin

Filing Safe—Class B and T-20 Labels

Filing Equipment is fully adjustable and interchangeable. Files are made in all standard sizes.

Herring - Hall - Marvin Label Safes all carry the T-20 label of the Underwriters' Laboratories, Inc., which secures a reduction of 20% from burglary insurance premiums on the contents of the safe in each case.

Safe with Chest

HARVEYZIZED BURGLARPROOF CHESTS

All Herring-Hall-Marvin Harveyized Round Door Cast Steel Chests are hardened drillproof and meet the specifications for the class H rate in Bank Burglary Insurance and the class E rating in Mercantile Insurance. These chests, furthermore, carry the label of the Underwriters' Laboratories, Inc., for an inspected relocking device which entitles the owner to a reduction of 10% from insurance premiums on their contents.

Harveyized Chest

Chest with Inner Door
forcing rods are passed in setting.

They may be anchored in Herring-Hall-Marvin Safes or in concrete walls or blocks. When intended for use in concrete they are built with welded exterior angles through which rein-

Insurance on the contents of these chests may be figured in all Class 1 risks under Mercantile Insurance at the bank burglary rate and when so figured they are subject to the discounts of the Bank Burglary Section.

Harveyized Chests are furnished if required with inner compartments. Partitions are slotted to receive money and inner compartment doors have either key locks arranged for single or double access, or combination locks.

Chest in Concrete

CHEST SIZES

Size No.	Weight, lb.	Contents in cu. in.
123	275	825
124	300	825
143	400	1512
144	430	1467
145	600	1293
202	700	3726
203	850	6399
204	1000	3564
232	1085	6284
233	1200	8710
283	1800	12844

Prices will be furnished on chests complete in concrete blocks and boxed for shipment.

Nos. 103 and 103 I.D. are designed to meet the demand for a high quality chest at a very low price. They secure the same insurance rates on their contents as the Harveyized chests listed here. Weights 225 lb. and 260 lb. respectively; No. 103 contains 480 cu. in.

WALL SAFES

Wall safes Nos. 1 and 2 have solid cast bodies with inside measurements as follows:

No. 1—6¾ in. high x 10¾ in. wide x 7⅛ in. deep;
No. 2—9¾ in. high x 14¼ in. wide x 7⅛ in. deep;
both with doors with turning lugs and combination locks.

No. 42—13½ in. high x 11 in. wide x 7 in. deep inside with ½-in. steel door locked with either key or combination locks as required.

Specifications York No. 7832-4 Vault Door

The contractor shall furnish and set in position York No. 7832-4 Vault Door to fit wall opening 91½ in. high, 46½ in. wide. This door is to bear the Underwriters' Laboratories 4-hour label.

Note: Write to our nearest branch office for folders describing the York vault door bearing the Underwriters' 6-hour label and for description of the one bearing the Underwriters' 2-hour label.

Door—To be built to a total thickness of 5½ in. with ⅝-in. outer and ⅝-in. inner plates riveted on edges to pressed steel moulding. Hung on three heavy malleable hinges with ornamental tips.

Frame—Surrounding door at front to be of 4½x⅝-in. steel bars at sides and top and 2x⅝-in. at bottom. These bars to be welded at all corners, forming a solid frame and securely fastened to ½-in. vestibule plates by 2½x2x⅝-in. steel angles. Back frame to be made of 3x2x⅝-in. steel angles fastened to vestibule and made removable so that vault door may be set in position after walls are completed.

Boltwork—Bolts of cold drawn steel each ¾-in. diameter of double action type, 4 front, 3 back, 1 up and 1 down, operated with drop handle and checked by one 4-tumbler combination lock approved by Underwriters' Laboratories, Inc.

Finish—A rich olive green lacquer inside and outside.

Specifications York No. 402 Vault Door

The contractor shall furnish and set in position York No. 402 Vault Door to fit wall opening 78½ in. high, 31½ in. wide.

Doors—Outer—Of ⅝-in. steel plate, reinforced inside on all edges by 2x2x⅝-in. steel angles. Inner—Of ⅝-in. annealed steel plates, opening into vestibule and checked by boltwork and key lock.

Boltwork—Frame formed by angles which strengthen door on all edges. Bolts of cold drawn steel, each 1-in. diameter, 4 across, 1 up and 1 down, operated with T-handle and checked by one 3-tumbler combination lock.

Frame—Surrounding outer door of 3x¼-in. flat steel bars welded at upper corners and securely fastened to vestibule by 1½x1½x¼-in. steel angles. Frame surrounding inside door to be made of 3x⅝-in. steel bars and shall be removable so door may be set after walls are completed.

Vestibule—Of No. 16 annealed steel plates fastened at corners by 1½x1½x¼-in. steel angles.

Finish—Doors rich olive green color. Handles, hinge tips, locking bolts, etc., polished and heavily nickelplated.

Specifications York No. 400 Vault Door

The contractor shall furnish and set in position York No. 400 Vault Door to fit wall opening 76¼ in. high, 26¼ in. wide.

Doors—Outer—Of ⅝-in. steel plate, reinforced inside on all edges by 2x2x⅝-in. steel angles and across center by panel bar of 6x⅝-in. plate. Inner—Of ⅝-in. annealed steel plates, opening into the vestibule and checked by bolt work and key lock.

Boltwork—Frame formed by angles which strengthen door on all edges. Bolts of cold drawn steel, each 1-in. diameter, 2 across, 1 up and 1 down, operated with T-handle and checked by one 4-tumbler combination lock.

Frame—For outer door 3x⅝-in. flat steel bars welded at upper corners and securely fastened to vestibule by 1½x1½x¼-in. steel angles. For inner door 3x⅝-in. steel bars, removable so door may be set after walls are completed.

Vestibule—Of No. 16 annealed steel plates fastened at corners by 1½x1½x¼-in. steel angles.

Finish—Doors a rich olive green color. Handles, hinge tops, locking bolts, carrying bar, etc., polished and heavily nickelplated.

Specifications York No. 4 Vault Door

The contractor shall furnish and set in position York No. 4 Vault Door to fit wall opening 78½ in. high, 31½ in. wide.

Door—Of ⅝-in. steel plate, reinforced inside on all edges by 1¾x1¾-in. steel angles.

Boltwork—Frame formed by angles which strengthen the door on all edges. Bolts of cold drawn steel, each 1-in. diameter, 2 across operated by T-handle and checked by one 3-tumbler combination lock.

Frame—Surrounding door of 3½x⅝-in. flat steel bars welded at upper corners and securely fastened to vestibule by 1½x1½x¼-in. steel angles.

Vestibule—Of 2½x3½x⅝-in. steel angles reinforced and fastened at corners by 1½x1½x¼-in. steel angles.

Finish—Door a rich olive green color. Handle, dial, dial ring, hinge tips, locking bolts, etc., to be polished and heavily nickelplated. Carrying bar satin nickel.

MOSLER BANK AND SAFE DEPOSIT VAULT EQUIPMENT

For a period of over 75 years, THE MOSLER SAFE CO. has specialized in the construction of fireproof type and burglarproof type safes and vaults. These installations are in some of the largest banks and safe deposit companies throughout the world, as well as in warehouses, chain stores, manufacturing plants and commercial offices, etc. Each installation is made to meet special conditions.

We show on this and the following pages some vault fronts and safes which illustrate the most modern forms of construction, having all of the most advanced types of burglarproof and fireproof features.

Our staff is at the command of architects, banks, chain stores, purchasing agents, manufacturers, merchants and others, for consultation and advice as to plans, specifications, estimates and suggestions. Write, wire or telephone the nearest MOSLER SAFE CO.'s office and requests for information will be promptly complied with.

Shown on this page and on the following page are a few examples of burglarproof type vault doors and vault equipment.

The Manual of Burglary, Theft and Robbery Insurance demand certain minimum re-

ments for obtaining basic rates of bank burglary insurance, and discounts from these basic rates for certain types of equipment.

Each problem must be worked out in itself. The thickness of a vault wall with one thickness of lining, is equivalent, for example, to another thickness of wall with a different thickness of vault lining. There is also a proportionate relationship between the thickness of a vault door and thickness of a wall and a lining.

The illustrations show different types of claddings. Details can be worked out to suit the architectural treatment of the space directly adjacent to the vault.

The interior of a vault is so far as the size of various safe deposit boxes is concerned, or the number and size of teller's chests, trust lockers or special chests, is an individual problem for each community.

Suggestions and further information will be given promptly and cheerfully upon request.

Wire, write or telephone the nearest MOSLER SAFE CO.'s office for conferences, suggestions, plans, specifications and estimates.

All exposed walls and ceiling are finished in polished steel plates, paneled. This represents a good general safe deposit box layout for a large city bank

Time Locks

In addition to locking a burglarproof type door with two combination locks, it is customary to have these locks further checked by a time lock. These time locks are so constructed that they can be set at the time the door is closed so that it is not possible to open the door until the time lock is run down to the hour that has been set for opening. These time locks are built with two, three and four movements, although the locks will operate on any one. The additional movements are added as a precaution in case one movement fails or is overwound.

Safe Deposit Locks

There are various types of safe deposit locks. One group is the regulation double nose or single nose safe

deposit lock, controlled by Bank's guard key and rentor's key. Another group is a similar lock but one with tumblers so constructed that locks bear the certification of the Underwriters' Laboratories as being "pick proof." The third group is the same as the second group except that the lock can be used over and over again set to a different key, without removing the lock from the door. This latter group is known as the changeable key lock.

Either one of the first two groups can be made with the rentor's keys sealed; the latter group always has the rentor's keys sealed.

A special catalogue on locks will be gladly sent to any architect or bank on application, and recommendations made to suit the particular requirements will cheerfully be given.

MOSLER INSULATED STEEL VAULT DOOR No. 3278

Equipped with Thermostatic Valve Door

Awarded Underwriters' Laboratories Six-hour Label for Fire Resistance

This insulated vault door is constructed entirely of steel. Equipped with a thermostatically controlled insulated valve door which automatically seals the interior of vault against heat penetration. Maintaining a lower temperature inside the vault than the maximum allowed by the Underwriters' Laboratories, Inc. Also practically eliminates water from fire hose reaching the vault interior.

The monolithic fire-resisting insulation is of great structural strength. It will not produce gases under fire exposure that might result in explosion. The hinges, boltwork and similar parts are of unusually rugged construction. The door swings back full 180° against vault wall. Made to swing right hand unless otherwise ordered.

Designed to fit masonry walls of any thickness exceeding 9 in., but, to afford protection equal to the door, the masonry should be 12 in. thick.

Specifications

The Contractor shall furnish and install a Mosler Insulated Steel Vault Door No. 3278 (Patented) for a in. wall. Masonry opening, 95¼ in. high by 45 in. wide (outside) and 79¾ in. high by 35 in. wide (inside). Clear door opening 78 in. high by 32 in. wide, the over all of front including architrave 91¾ in. high by 50 in. wide.

Frame—Consisting of jambs, head and sill, shall be entirely of steel with interlocking tongue and grooves.

Door—Shall be 6¾ in. thick, entirely of steel with interlocking tongue and groove edges containing fire-resisting insulation. Main door shall be equipped with a supplementary insulated valve door, thermostatically controlled.

Underwriters' Label—The door and frame shall be complete in all respects and bear the Underwriters' Laboratories, Inc., label for six-hour fire resistance at high temperature.

Bolts—Door shall be equipped with seven 1-in. diam. locking bolts, three to the lock jamb, one each to head and sill, with interlocking tongue and groove and two bolts to the hinge jamb. Operated by octagonal grip lever handle.

Lock—Shall be a Mosler four-tumbler combination lock capable of many thousand changes. Equipped with shouldered spindle, and protected by a hardened 5-ply steel plate and hardened steel guard plate.

Pressure Bar—Door shall be seated to surrounding frame by pressure bar device at front edge of door, operated by lever handle covered with octagonal grip.

Foot Bridge—Provide a folding inclined non-slip foot bridge, to protect sill.

Finish—All exposed surfaces of door and frame shall be in Mosler standard olive green, ornamented with gold striping. Pressure bar device, metal surface of handles, lock and hinge tips shall be heavily nickelplated rubbed to a satin finish.

Swing of Door—Door shall swing to the [right] [left].

Drawings and Instructions—Contractor shall obtain from the manufacturer necessary drawings and instructions for the proper installation of the vault door, and shall install the door and surrounding walls in strict accordance therewith.

No. 3278 Mosler (Patented) Insulated Steel Vault Door

Diagram for Installing No. 3278 Mosler Vault Door

MOSLER INSULATED STEEL VAULT DOOR No. 7832-4**Designed for Walls 6-in. Thick and Over***Awarded Underwriters' Laboratories Two-hour Label for Fire Resistance*

This insulated vault door is constructed entirely of steel and may be set in a wall of any thickness exceeding 6 in. When installing this door, a wooden form should be placed inside the vault against the vault door frame, to retain the grout while being poured.

Specifications

The Contractor shall furnish and install a Mosler Insulated Steel Vault Door No. 7832-4 (Patented) for a in. wall. Masonry opening 91 $\frac{3}{4}$ in. high by 41 $\frac{1}{2}$ in. wide (outside) and 88 $\frac{1}{8}$ in. high by 41 $\frac{1}{2}$ in. wide (inside). Clear door opening 78 in. high by 32 in. wide, and over all of front including architrave 88 $\frac{1}{4}$ in. high by 45 in. wide.

Frame—Consisting of jambs, head and sill, shall be entirely of steel with interlocking tongue and grooves.

Door—Shall be 4 in. thick, entirely of steel with interlocking tongue and groove containing fire-resisting insulation.

Bolts—Door shall be equipped with five round locking bolts, $\frac{3}{4}$ -in. diam., three to the lock jamb, one each to head and sill, with interlocking tongue and groove to the hinge jamb. Operated by a lever handle covered with octagonal grip.

Lock—Shall be a Mosler three-tumbler combination lock capable of many thousand changes. Equipped with shouldered spindle, and protected by a hardened 5-ply steel plate and hardened steel guard plate.

Foot Bridge—Provide a folding inclined non-slip steel foot bridge, to protect sill.

Finish—All exposed surfaces of door and frame shall be finished in Mosler standard olive green, ornamented with gold striping. Metal surface of handles, lock and hinge tips shall be heavily nickelplated and rubbed to a satin finish.

Swing of Door—Door shall swing to the [right] [left].

Drawings and Instructions—Contractor shall obtain from the manufacturer necessary drawings and instructions for the proper installation of the vault door, and shall install the door and surrounding walls in strict accordance therewith.

**No. 7832-4 Mosler Insulated Steel Vault Door****Diagram for Installing No. 7832-4 Mosler Vault Door****MOSLER STANDARD BOOK AND STORAGE VAULT DOORS****Nos. 30, 50 and 60 Series**

Mosler Standard Book and Storage Vault Doors are made in several styles and sizes, a few of the most important of which follow. All single door types are shown mounted to swing right but may be made to swing left when so ordered.

Mosler Vault Door No. 30 Specifications

The Contractor shall furnish and install a Mosler Steel Vault Door No. 30 for a 5 $\frac{1}{2}$ in. finished wall. Masonry opening 77 $\frac{1}{2}$ in. high by 32 $\frac{3}{4}$ in. wide in front, recessed in back to 79 $\frac{1}{2}$ in. high by 36 $\frac{3}{4}$ in. wide for walls over 4 in. thick. (Recess and opening flush at bottom.) Clear door opening 76 in. high by 30 in. wide, and over all of front frame 80 $\frac{3}{4}$ in. high by 39 $\frac{1}{4}$ in. wide. Back frame removable. Vestibule body over all 76 $\frac{3}{4}$ in. high by 31 $\frac{1}{4}$ in. wide.

Door—Shall be 1 $\frac{3}{8}$ in. thick. The $\frac{1}{8}$ -in. outer door plate, and the $\frac{1}{8}$ -in. Z-angles and U-shaped sections at the bottom shall be electrically welded, forming the jambs.

**Closed****Open****No. 30 Mosler Vault Door**

Bolts—Door shall be equipped with three live bolts at front and three live bolts at rear, all $\frac{3}{4}$ -in. diam. Operated by drop handle with satin nickel finished head and octagonal grip.

Lock—Shall be Mosler three-tumbler combination lock capable of many thousand changes. Entire lock guarded by $\frac{3}{4}$ -in. open hearth steel plate and $\frac{1}{4}$ -in. hardened drill-resisting plate.

Hinges—Two heavy solid rolled steel hinges shall be electrically welded to door and frame.

Jambs—The jambs of the vestibule are formed on three sides with a deep recess to receive the door.

Finish—All exposed surfaces of door and frame shall be finished in Mosler olive green lacquer finish with gold striping. Hinge tips, handle head and combination lock shall be finished in satin nickel. Combination dial shall be black enameled with white numbers.

Swing of Door—Door shall swing to the [right] [left] 31 $\frac{1}{8}$ in.

Note: Can be furnished to clasp walls of greater thickness than 5 $\frac{1}{2}$ in., but if possible wall opening should be formed with recess in back.

Weight—260 lb. net.

Mosler Vault Door No. 52

Outer Door— $\frac{7}{8}$ in. thick on all edges and across center for additional lock protection. Five single-acting bolts, 1-in. diam., operating through angle type bolt frames, controlled by Mosler combination lock and equipped with Mosler special relocking device.

Inner Doors— $\frac{3}{8}$ in. thick. Right-hand door equipped with flat vertical boltwork, interlocking at center with left-hand door, controlled by patent key lock.

Wall Opening—77 in. high by 32 in. wide by 20 in. deep.

Opening through Outer Doorway—74 in. high by 28 in. wide.

Finish—Outer and inner doors finished in black. Outer door striped in gold. Inside of vestibule finished in gray. Boltwork, hinge tips, handles and trimmings of door are highly polished and heavily nickel-plated.

Open
No. 52 Mosler Vault Door

Mosler Vault Door No. 53-D

With double outer and inner doors.

Closed

Outer Doors— $\frac{7}{8}$ in. thick on all edges and across center for additional lock protection. Six single-acting bolts, 1-in. diam. on each door, operating through angle type bolt frames, controlled by Mosler combination lock and equipped with Mosler special relocking device.

Inner Doors— $\frac{3}{8}$ in. thick. Right-hand door equipped with flat vertical boltwork, interlocking at center with left-hand door, controlled by a patent key lock.

Wall Opening—81 in. high by 42 in. wide by 22 in. deep.

Opening through Outer Doorway—78 in. high by 38 in. wide.

Finish—Outer and inner doors finished in black. Outer doors striped in gold. Inside of vestibule finished in gray. Boltwork, hinge tips, handles and trimmings of door are highly polished and heavily nickel-plated.

No. 53-D Mosler Vault Door

Special Chests for Retail and Chain Stores, Oil Stations, Etc.

The Mosler armored steel money chest, particularly adapted for use in retail stores, chain stores, oil stations, etc., takes the lowest burglary insurance rate and in addition to this lowest rate an additional special discount is given by the insurance companies for the Mosler re-locking device which is found on every Mosler armored steel money chest.

Illustrations—The illustrations shown below are as follows:

Fig. A—An exterior view of the complete unit, consisting of the Mosler armored steel chest encased in a reinforced concrete block, the outside having a

granolithic cement finish, the finish of the chest.

Fig. B—Shows still another type of Mosler armored steel money chest encased in a concrete block, the outside of the block being finished in metal, painted the same color as the chest.

Fig. C—Shows the inside view when the door of either chest is open. Note that there is a space between the back of the chest door and the face of the compartment, which is used for the purpose of placing a box containing a nominal amount of cash for the chain store manager's use on opening his store in the morning. All other monies are deposited through an

Fig. B

Fig. C

inside slot above the inside compartment by the manager, this compartment being locked by a certified pickproof fourteen (14) tumbler two (2) key lock, one key held by the chain store collector and the other by the individual store manager, it requiring both keys to open the compartment. This lock is certified pickproof by the Underwriters' Laboratories, Inc., and the entire equipment takes the lowest burglary insurance rate and a special discount in addition for the Mosler re-locking device.

Service—Our nearest representative will gladly make a survey of your requirements, giving sizes and suggestions as to the type of chest required.

MOSLER NIGHT DEPOSIT SAFE

THE MOSLER SAFE CO. announces a new night depository for banks desirous of rendering full day and night service to their depositors. By day this new bronze night depository and seal is a distinctive advertisement of a bank's ability to offer complete service every hour of the day. By night it is a convenience for depositors.

Details of Construction

Outer Deposit Entrance—The outer deposit entrance or chute door is circular in form and constructed of a one-piece integral bronze casting containing burn-resisting properties. Edges or jambs of door are 2 in. thick.

The face of the door is ornamented with an appropriate bronze seal incorporating the name of the bank in raised letters. Should the bank have its own seal, this can be reproduced and placed on the face of the door for a reasonable additional sum.

The door construction comprises a series of drillproof and openhearth steel plates with a finely finished bronze plate of suitable thickness covering entire inside face of door to give a handsome finished appearance.

The door is hung on a heavy bronze hinge with concealed fastenings and secured with a high class corrugated key lock so arranged as to prevent withdrawal of key until the door has been closed and locked.

The exposed cylinder of lock is surrounded by a handle designed especially for this type door to permit greatest ease of opening and closing.

Hopper—The hopper located at head of chute directly in back of exterior door revolves on an axis and is pulled down to receive bags and when pushed back deposits the bags into the chute leading to the receiving safe. This hopper and axis are designed to receive electric alarm system by electric protection companies when desired.

Door Frame—The door frame measures 20 in. at the front in outside diameter and is constructed of an ornamental bronze casting containing burn-resisting properties. A separate bronze box contains the words "night deposits" in white translucent letters. Electric lamps are provided back of hinged front of box for the purpose of permanently illuminating these letters at night.

Metal Chute—The metal chute connecting the outer entrance door to receiving safe is constructed at such angle as may be required to permit installation of receiving safe on bank room floor or basement. Outside dimensions of this chute are approximately 13½ in. wide, 9½ in. deep, and constructed 1 in. thick when receiving safe is located on bank room floor. If receiving safe is located in basement, this chute

will then be constructed 12½ in. wide, 8½ in. deep outside, and will be ½ in. thick, these thicknesses conforming to requirements specified in burglary insurance manual.

Receiving Safe—The receiving safe is provided with door, circular in form, measuring outside approximately 30 in. high, 28 in. wide and 27 in. deep. Body of safe is 1 in. thick and the door thereto, constructed of a one-piece integral steel casting, is 3 in. thick. This door is equipped with lugs on body of safe, thus forming a metal-to-metal contact when door is closed and in position ready for locking. Painted steel finish plate is provided to cover inside face of circular door.

This door is hung on heavy, crane-type, steel hinge and is operated by means of a massive rim handle of octagonal design, heavily nickelplated and rubbed to satin finish.

The bolting mechanism of receiving safe door is controlled by high-class Mosler bronze-case combination lock, the dial of which is in black enamel with white numbers.

A Mosler re-locking device, approved by Underwriters' Laboratories, Inc., and bearing their label, is incorporated in the combination lock mechanism to protect the lock against the use of explosives or external violence.

The safe and locking mechanism are so designed that a timelock can be attached if desired, but the timelock is not a part of the regular equipment.

Deposit Bags, Locks, Keys, etc.

There are provided heavy canvas customers' deposit bags, each equipped with padlock and two keys, each bag numbered and lettered with the bank's name. An equal number of keys are furnished for the outer deposit entrance or chute door.

Concrete and Masonry Work

In order that a night deposit safe be accorded the burglary insurance rate and special discount provided for it in the burglary insurance manual, the top, bottom, back and sides of receiving safe, as well as the metal chute, must be covered with a minimum of 6 in. of concrete reinforced with steel rods spaced approximately 4 in. apart on centers both ways.

Insurance Rate

The receiving safe is designed to take the lowest burglary insurance rate, as provided by the burglary insurance manual, the approved re-locking device, as above mentioned, entitling the safe to a special discount from regular published burglary insurance rates.

Explanation of Underwriters' Laboratories Tests for Mosler Fireproof Filing Safes Bearing the "A" and "B" and "T-20" Labels

For "A" and "B" Labels—To bear these labels, a safe must successfully withstand fire exposure, drop or impact, and explosion tests. The "A" labeled safe must withstand a 4-hour exposure to heat reaching 2000° F. and the "B" labeled a 2-hour exposure to heat reaching 1850° F. During these times, the inside temperature of the safe must not exceed a limit of 300° F.

Both "A" and "B" safes receive the same drop or impact test and explosion test. They are heated for one hour reaching 1700° F. and while red-hot are dropped 30 ft. on a bed of broken rock, etc. Regardless of condition, safe is placed back in furnace in an inverted position and reheated for one hour at high temperature. In the explosion test a very intense flame is applied in such a manner as to subject insulation of safe to severe reaction. If any dangerous gases are present they will ignite and explode.

For "T-20" Labels—A safe must withstand a concentrated attack by drills, sledge-hammers, mechanical tools, etc. Safes so labeled are subject to a reduction of 20% in burglar insurance premiums.

Standard Rectangular Door Steel Chests

These standard rectangular door chests are constructed of the highest grade open-hearth and drill-proof steel. The plates are carefully and securely joined forming a one-piece construction of great strength.

The doors are hung on heavy, solid bronze hinges and are equipped with a vertical pressure bar system, with operating handle for closing the door securely in position.

The boltwork consists of round, polished steel bolts controlled by high-class bronze-case combination lock.

The combination dials are black enameled with white numbers and exposed metal parts are polished and heavily plated.

Outside and inside of all chests finished in Mosler standard olive green. A polished steel plate covers the inside face of the door.

All plated fittings are in satin nickel finish.

For other A.D.T. Central Station and Proprietary Systems and list of Central Stations, see Manufacturers' Index

PHONETALARM—A.D.T. BANK VAULT PROTECTION SYSTEMS (APPROVED GRADE A)

The Phonetalarm provides a system of bank vault protection operating on the sound detection principle. Protection is provided by means of microphones or detectors installed on the ceiling of the vault. Any attempt to force an entrance into the vault necessarily results in certain noise. This causes the diaphragms of the detectors to vibrate with a resulting effect upon certain instruments which cause the alarm to operate.

The system is effective against attack by means of hammering, drilling, burning or explosion. A sharp blow on the vault wall or any part of the vault structure will cause the alarm to sound; it will not operate from sounds originating elsewhere on the premises. Vault door and bolts are provided with protection contacts so that an alarm will be given upon any attempt to open the vault prior to the prescribed opening time.

The simplicity of Phonetalarm construction makes it possible to install a system without inconvenience in a vault already erected as well as in vaults under construction. The devices are always accessible, so that repairs and adjustments can be made at any time without difficulty. The Phonetalarm is less expensive to install than any other type of system, yet it has an unusual value from a protection standpoint.

The A.D.T. Phonetalarm is the original sound detection system, the first system having been installed by A.D.T. engineers in 1914. Since that date, scores of banks throughout the country have installed the Phonetalarm, including many Federal Reserve Banks and other large banking institutions. This system has the approval of the Underwriters' Laboratories, Inc., and is listed as Grade "A," thus securing the maximum discount on burglary insurance premiums.

A.D.T. Central Station Phonetalarm

Under Central Station operation the

Phonetalarm System is given continuous supervision. All alarms are responded to immediately by men especially trained for this service. A careful check is maintained on the opening and closing of the vault and it cannot be left open or be reopened after the usual closing hour without causing an investigation.

Each Phonetalarm System is connected to the Central Station by means of an individual wire. This is under constant supervision and cannot be opened, shorted or grounded without detection by Central Station operators.

The Phonetalarm detectors are tested periodically during the closed period by means of a sounding device within the vault which is operated from the Central Station. This simulates an alarm condition and the signal received in the Central Station is identical with one originating from an attack on the vault.

Service is an important item in Central Station operation and all systems are carefully inspected and tested periodically in order to assure perfect operation. Skilled repair men are constantly on duty to render service in the event repairs are necessary.

Central Station Phonetalarm may be secured in all cities where A.D.T. Central Stations are maintained. For complete list, see our other pages as listed in Manufacturers' Index.

Typical Phonetalarm Bank Vault Installation

Local Bank Vault Phonetalarm

Designed for installation anywhere without restriction as to location. Consists of Phonetalarm detectors and control equipment together with apparatus for providing an alarm locally. The alarm device is an 18-in. loud ringing bell installed in a protected steel housing. The protection is under the control of a time clock within the vault. A visual signaling device installed on the outside of the vault indicates condition of the alarm at all times. Means are provided for making sound tests after vault is closed.

Control equipment includes the A.D.T. sound accumulator adjustable as to number and intensity of shocks which eliminates unnecessary alarms due to momentary disturbances. An automatic cutout and reset silences the bell and restores system to normal after a period of ringing. Energized from dry cells or storage battery as desired.

Serviced from A.D.T. offices located in all large cities in the United States. Periodic inspections provided; prompt service may be obtained in event repairs or replacements are required.

Bankers Electric Protective Association Systems

Vault protection systems of the Bankers Electric Protective Association of Boston can now be secured through the A.D.T. organization. The nation-wide facilities of the A.D.T. are also available to provide prompt and efficient inspection and maintenance service.

For complete information and descriptive booklet regarding the Bankers Electric systems, write The Bankers Electric Protective Association, 60 State Street, Boston, Mass.

Holdup Alarm Systems

A.D.T. systems for protection against daylight holdups may be installed in conjunction with all types of vault protection equipment or may be installed independently. These systems can be arranged to give an audible signal or may be of the silent type to signal a remote station.

Write for descriptive literature on the new "Model OBA" system which permits an alarm to be transmitted by simply obeying the commands of the bandit. This is the only system which can be operated without detection.

FEDERAL LABORATORIES, INC.

A Modern Protection Against Banditry

The daring and speed of modern bandits have rendered

Federal Model K Gun

Concealed in bank partition cornice — electrically operated and invisible.

ineffective old-fashioned methods of protection against daylight holdup of banks, pay offices, etc. Eight years ago our chemists and engineers developed a tear gas protective system which has enjoyed the approval of the Underwriters' Laboratories, Inc., for the past five years. This equipment is installed in a manner that will permit the entire public lobby of a bank to be flooded in a fraction of a second with a concentration of Federal Tear Gas. The attacking bandits are rendered helpless and temporarily blind by the gas and may be easily captured by employees of the bank or by officers. The Federal Gas system is operated without being noticed by the bandits, while their commands are being obeyed. The gas is propelled into the lobby away from the cages and counters, and employees behind the cages have several minutes in which to lock up money and securities before the effects of the gas reach them.

A Bank Hold-up Frustrated by Federal Gas

Equipment and Installation

The equipment consists of a number of discharge units built into the counters or cages at strategic points, all interconnected and concealed from view. Foot controls are placed at each teller's window, in the officers' quarters and at other essential locations in the working space. The entire system is connected to a central control cabinet by means of which the system is periodically tested.

Discharge units are concealed behind the wood, marble, or metal facing of the cages or counters. The small ornamental nozzles of the discharge units are the only exposed parts of the system. These are decorated to match perfectly the surface on which they are placed.

Installation is made in accordance with the code of the Underwriters' Laboratories, Inc., and is subject to the inspection of the engineers of that organization. All wiring is carefully insulated and protected by conduit. No alteration of fixtures is necessary to accommodate any part of our equipment. No ugly or unsightly equipment is exposed to the view of the public. Installations are made in connection with both new type friendly counters and the standard tellers' cages.

Method of Control

The foot controls used to actuate our Federal Gas systems are expertly designed to guard against unintentional discharge. They can be operated only by a voluntary pressure with the toe

of the shoe made while the heel is lifted from the floor. These controls cannot be operated by accidental contact with brooms, mops, etc.

Hand controls are used only in rare cases and are of the approved counter-sunk two-button type. Each control may be tested separately at the control cabinet.

Federal Gas—Its Properties and Action

Federal Gas is a patented crystalline form of tear gas packed in solid cartridges for stability. It is not contained under pressure of any kind and is not subject to leakage. The Federal Tear Gas vapor which so effectively blinds the attacking bandits is developed instantly when the cartridges are discharged. Nine parts in one million of Federal Gas vapor are sufficient to cause profuse lachrymation and as the concentration produced by our system is hundreds of times that proportion, the eyes of victims are irritated to a point of temporary blindness. Federal Tear Gas is the only such product that is put up in solid form.

The most attractive feature of protection by means of Federal Gas is that this vapor is absolutely non-toxic and harmless. Our equipment has had the approval of the Underwriters' Laboratories, Inc., for five years and entails no additional liability on the part of the institution using it.

All standard liability insurance policies will include our equipment without extra premium charge.

Users of our modern daylight protective systems

Federal Foot Control

Cannot be accidentally operated

receive a substantial reduction in holdup insurance premiums.

Prominent Users

Federal Gas installations and protective devices are used in thousands of the leading financial institutions of the country including banks, industrials and public institutions. A list of the more prominent users follows:

Bureau of Printing and Engraving, U. S. Treasury
 Pennsylvania State Treasury
 Ohio State Treasury
 Chicago City Treasury
 Detroit City Treasury
 Corn Exchange National Bank, Philadelphia, Pa. (seven branches)
 United States Savings Bank, Newark, N. J.
 Syracuse Trust Company, Syracuse, N. Y.
 Schenectady Savings Bank, Schenectady, N. Y.
 Rhode Island Hospital Trust Company, Providence, R. I.
 First National Bank, Pittsburgh, Pa.
 Grand Rapids National Bank, Grand Rapids, Mich. (eight branches)
 First National Bank, Wichita, Kan.
 Monongahela National Bank, Pittsburgh, Pa.
 Citizens National Bank, Peru, Ind.
 Ford Motor Company, Detroit, Mich.
 Carnegie Steel Company (all pay offices)
 William Penn Hotel, Pittsburgh, Pa.

Several thousand other users supplement this list.

Architects, bankers and other financial executives may secure full information regarding Federal Gas equipment by communicating with the home office.

CLEAR-VISION COUNTERS, INC.

Operating Under Domestic and Foreign Patents

FORMERLY JOHN POOLE

619 Fourteenth Street, N. W.
WASHINGTON, D. C.

License

We do not manufacture. We merely license the use of this system, and shall quote a license fee to any one interested, the fee being based upon the number of feet of counter used.

John Poole "Clear-Vision" or "Friendly" Counter

The drawing below clearly indicates both the form and construction of this unique counter for banks, brokers' offices, building and loan association offices and, in fact, for all types of offices in which a cage or partition was formerly considered necessary for the protection of the person in charge and the cash he was handling.

Advantages of the "Clear-Vision" Counter

Light and vision are greatly improved.

Ventilation is much better because of the absence of high partitions and glass.

Greater protection is assured due to the visibility of the working quarters.

The absence of high partitions gives the effect of a larger room.

The counter forms a continuous window and every foot is available for service if needed, thus allowing the maximum flexibility and elasticity.

It is cheaper to build because less material and labor are required.

Fifty per cent greater utility of floor space is obtained.

More intimate relations between customer and teller are established.

Special Construction

Each counter is constructed in accordance with the architect's own details and specifications, which naturally will reflect the architect's and prospective user's own individual ideas and tastes.

INDESTRUCTO GLASS CORPORATION

Manufacturers of Bulletproof and Scatterproof Glass

527 Fifth Avenue, NEW YORK, N. Y.
FACTORY: FARMINGDALE, LONG ISLAND, N. Y.

Indestructo Bullet Resistant Glass

Designed to provide great strength and resistance to penetration, especially of bullets from firearms. It is a clear vision, laminated product, made of alternate layers of plate glass and a flexible, transparent binding material, firmly united in one solid sheet under a patented process, which not only provides bullet resistance *but also insures against separation, discoloration or reduced transparency.*

The degree of resistance of laminated glass is in direct ratio to the strength of the bond uniting the glass with the transparent, flexible material. The Indestructo bond is accomplished without gelatins or other adhesives which frequently dry out or suffer natural chemical reaction causing loosening of the bond, total separation or objectionable yellow discoloration, rendering the glass unfit for the uses primarily intended.

Revolver Resistant Glass—This standard material can not be penetrated by any revolver, regardless of caliber or ammunition. The windshield in the accompanying photograph withstood 11 shots from a .38 caliber long barrel police special revolver in a small area and a final shot from a .45 automatic in the center of the already weakened area. There was no penetration, no displacement of glass from the back and no dangerous mass action.

Indestructo Glass in Windshield
Twelve shots without penetration

Special Bulletproof Glass—Glass, which will resist penetration from any weapon, may be produced by varying the combination of thicknesses and number of layers. Data on heavy side arm and shot gun resistant glass is given in table below. In most cases the standard revolver resistant material provides adequate protection at minimum cost.

Indestructo Scatterproof Glass

Developed primarily for protection against injury from flying glass in windows of buildings or vehicles. It is made in two grades, plate quality and sheet quality.

Sizes

The binding material used is procurable in sheets 30x60 in. only, so that this size should be considered in laying out a bank counter or other structure to be made banditproof. Larger lights can be procured by splicing the binding material which, however, results in a fine hair line being visible in the finished light at the point of splice. Splicing can be in one direction only for a given piece. Due to other conditions the maximum sizes obtainable by splicing are 36x60 in. or 30x66 in.

THICKNESS AND WEIGHTS OF INDESTRUCTO GLASS

Description	Thickness, in.	Tolerance, in.	Wt., lb. per sq. ft.		Number glass layers
			Net	Crated	
Bullet Resistant:					
Revolver	1	1/16	11	15 to 16	3
Heavy side arms	1 1/8 to 1 1/4	1/16	13	18	3
Shot gun	1 1/2 to 1 3/4	1/32	14 to 16	17 to 20	4
Scatterproof:					
Grade A	3/16 to 5/8		3 to 6	4 to 8	2
Grade B	1/4 to 1/2		2 to 4	3 to 6	2

Public National Bank, New York, N. Y.
EUGENE SCHOEN, Architect
Bronze speak fixtures and sunken deal trays

Installation and Fixtures

Indestructo bullet resistant glass requires no special methods of setting or framework, other than that the frame should be large and strong enough to receive and carry the heavier and thicker glass. Aside from this, standard practices in setting glass apply.

There are various types of fixtures for passing of money and for communication between teller and customer, any of which are well adapted for use with this glass. One type has bronze speak fixtures and sunken deal trays while another has sunken deal tray with an offset wicket giving a space of 1 in. around the glass for passage of the voice thus eliminating the use of speak fixtures.

Indestructo glass can not be cut to size after manufacture, so it is necessary that exact sizes be furnished with orders if shapes are rectangular or circular. If irregular shapes are required templates or patterns should be furnished. This glass can be drilled, ground, polished and otherwise worked the same as ordinary glass, but this work must be done by the manufacturer. It also can be etched, chipped or sandblasted to produce ornamental surface patterns.

Peninsular State Bank, Detroit, Mich.
V. POTTLE, Architect
Offset wicket with 1-in. space on sides for voice passage and sunken deal trays

Guarantee

Indestructo glass is furnished under a guarantee against deterioration unfitting it for use due to faulty manufacture.

MOTOR OPERATED GATES FOR JAILS

Gates for Jails

Electrically operated gates are a necessity in jails. Sometimes it is desirable to operate only one set of gates to keep out intruders and to admit those having proper credentials. This is often the case in industrial plants and on private estates.

In some cases where valuable property is easily removed or in detention cases, it is necessary to have two sets of gates, one directly behind the other to form an enclosed cage. Here it is possible to thoroughly investigate the person or vehicle entering or leaving by operating one set of gates at a time.

We have installed a number of our motor units for the operation of gates of jails in different parts of the country. As illustrated in detail on page 20, the gate in the outer wall is operated on the outside of

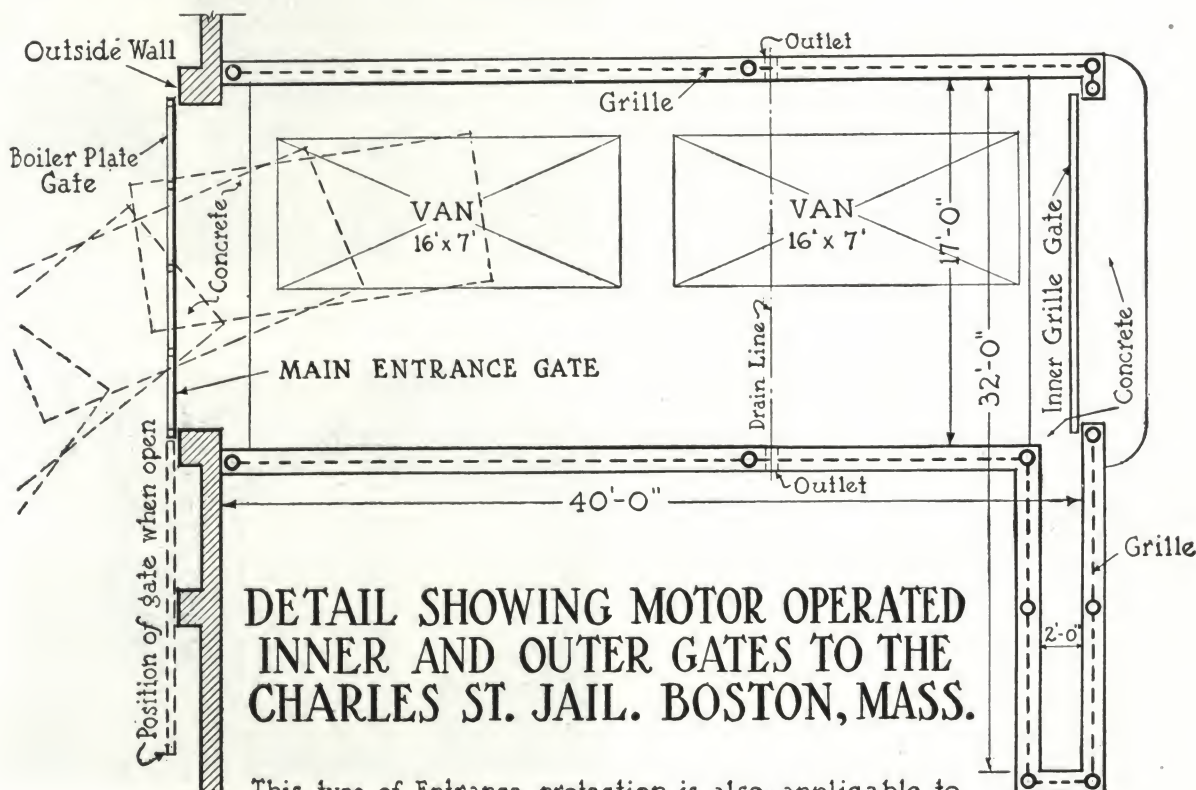

the enclosure wall. The inside gate is at the end of an enclosure which is generally large enough to accommodate two large vans. When the outer door is open, the inner gate is shut and is not opened until a thorough examination is made of driver, trucks and contents.

Two Electrically Operated Sliding Gates at Suffolk County Jail, Massachusetts

This being completed, the inner gate is opened. The process is reversed when going out. This also prevents a rush of convicts for the gate when it is opened.

Control—These gates are operated by remote control. They also have limit switches and brakes similar to those for garage doors. The operating mechanism is overhead, and protected from the weather by hoods, etc. The gates are supported on rollers running on industrial track which is also protected from the weather by hoods.

DETAIL SHOWING MOTOR OPERATED INNER AND OUTER GATES TO THE CHARLES ST. JAIL. BOSTON, MASS.

This type of Entrance protection is also applicable to Industrial Plants and others needing protection

THE FRIES AND SON STEEL CONSTRUCTION AND ENGINEERING CO., INC.

Expert Jail and Prison Builders

TELEPHONE
COVINGTON 1635

Second and Madison Avenues
COVINGTON, KY.

Products

Builders of CELLS for Jails, Prisons, Police Stations and Lockups, equipped with Automatic Sliding Door and Hand Pull, and Hydraulic Locking Devices; Prison Plumbing Fixtures; Round, Hexagon, Rib and Flat Interlocking Bar Grating for window guards, corridor gratings.

Experience

THE FRIES AND SON STEEL CONSTRUCTION AND ENGINEERING CO., INC., are backed by an organization made up of men whose experience ranges from twenty to fifty years, and who have built some of the largest jails and prisons in the United States.

Tool Resisting Steel

We use nine-ply tool resisting steel for all grated work made according to standard specification, in place of regular five-ply steel referred to in specification as tool resisting, consisting of alternate layers of low carbon and high carbon steel, all layers thoroughly welded and the high carbon steel layers hardened, to resist action of cutting tools.

Where absolute security is desired, we advise using our "Fries Special" Heat and Tool Resisting Steel for all exterior sides of cell blocks, also for the window gratings.

Cell Door Locking Device

Our manually operated fully selective, keyless locking device is used in connection with sliding doors and is designed on lines of durability and simplicity as well as neatness. The device has no springs, adjusting nuts or collars that might come loose and cause trouble. Our device permits operator to open or close each door individually or all doors collectively, or close or open all doors *collectively*, although some doors may be in open position while others are in closed position, or open or close any combination of doors desired.

Our locking device is entirely and securely encased by steel plate rendering it *tamperproof*.

Automatic Corridor Lock

Our corridor doors are provided with a simple locking bar, operated from within the lever box. The corridor door locks automatically on lightly closing same, and is deadlocked. This lock is tamperproof.

Special Equipment

We furnish everything necessary for the completed jail or prison installation, such as, one-piece, sanitary, combination lavatory and toilet niche seat; electric light boxes; latest improved jail plumbing fixtures; speaking panels; plate and glass partitions; steel entrance doors; bunks; padded cells; steel stairs and window guards.

Engineering Department

Our Engineering Department will gladly assist architects, engineers and officials who are contemplating any jail or prison construction. We will furnish up-to-

date layouts, detail drawings, specifications and estimates, for jail equipment, without charge.

Condensed Specifications

Dimensions, etc.—County jail cells for 4 prisoners 7x8 ft. x 7 or 8 ft. high (8 ft. preferable). Prisoners corridor 6 ft. Shower enclosures 3 ft. square. All exterior wall and ceiling plates 1/4 in. toolproof. All exterior gratings toolproof steel, not less than 20 lb. to sq. ft. Inside plate partitions 1/4 in. Bessemer steel. Inside gratings and doors 10 lb. to sq. ft. Bessemer steel. Cells in H and J for city jails 6x7 ft. and 5x7 ft.; 2 prisoners to cell; plate work 1/4 in.; gratings and doors same as specified below for window guards, all Bessemer steel.

Cell Door Locking Device—Cell doors 2x6 ft. hung on ball or roller bearings, to be easily opened, closed and locked entirely from lever box on front of cage, and to be operated in either direction without affecting any other door in series. Main cage door same construction as grating, securely hinged and locked with automatic jump lock and heavy slide bars operated and locked inside lever box.

Toolproof Steel—Bars and plates specified as "toolproof" to be laminated 5-ply steel, composed of alternate layers of high carbon crucible or manganese steel, thoroughly welded to layers of low carbon steel; the crucible layers being highly tempered and hard-

Utility Corridor—4 ft. wide as in D or 2 ft. 6 in. wide if staggered, as in H.

Toilet Niche—22x16 in. x 4 ft. 6 in.; seat 17 in. above floor, circular back, toilet hopper underneath.

Bunks—2 ft. 6 in. x 6 ft. 6 in.; 2-in. angle frame; slats 1 1/4 in. x No. 16 interwoven and riveted 3-in. sq. mesh, or No. 16 solid plate perforated and riveted.

Floors—No steel floors. Vertical bars and gratings bedded in 2 1/2 in. of concrete, cement finish. Reinforcing under felony cells, 1/2 in. high carbon bars 5 in. apart both ways.

Guards Corridor—Cells 3 ft. 6 in. from walls to allow for radiators and guards walkway. 5 ft. on front end.

Window Guards—Verticals 3/8 in. round, 4 in. on centers, shouldered and mortised. Horizontals 2 1/4 x 3/8 in., 12 to 16 in. apart; ends of horizontals bent back for building in. Bessemer steel, or toolproof if prisoners have access.

Iron Doors—1/4-in. plate, stiffened with 2-in. angle and paneled. Grated doors 3/4-in. round verticals, 4 in. on centers. Horizontals 2 1/4 x 3/8 in. mortised, 16 in. apart. Heavy forged hinges; 5 tumbler flat jail dead locks. 2 1/2-in. angle frame, No. 11 steel jambs; 1/4-in. diamond threshold plate. All Bessemer steel.

Hospital and Female Cells—1/4-in. plates, grating and doors same as for window guards. Usually against outside walls. Bessemer steel.

Shelby County Courthouse and Jail, Memphis, Tenn.
JONES & FURBRINGER, Architects

SOUTHERN PRISON COMPANY

MAIN OFFICE AND WORKS
SAN ANTONIO, TEXAS

BRANCHES
BIRMINGHAM, ALA. COLUMBUS, OHIO KANSAS CITY, MO. SAN FRANCISCO, CAL.

Products

Manufacturers and builders of JAILS and PRISONS: Steel Cells, Sliding Door Locking Systems, Modern Plumbing, etc., for State, county and municipal purposes, police stations, and hold-overs.

Also various kinds of Jail and Prison Equipment, Steel Grating, Cell Room Lining, Doors, Window Guards, Bunks, Hammocks, etc.

Experience

For about forty years the management of this company has been actively engaged in designing layouts; building and equipping jails and prisons, giving special attention to the proper classification of prisoners; perfection of interlocking tool and heat resisting steel cells; selective type, sliding door locking systems; and ventilated niche back, odorless sanitary plumbing fixtures—the most vital features in jail and prison construction.

Material

In the highest class cell work, we use our own special steel for the grating, having vertical and horizontal bars securely interlocked at each intersection without reducing the body of the bars at such intersections.

We also use for certain classes of work standard compound, or "five-ply" tool resisting material. Ordinary bessemer, or open hearth steel is used for minor work, such as partitions, hold-overs, etc.

Ventilation and Plumbing

Ventilation—Owing to the frequently crowded condition of jails we advocate that grating in cell walls be so arranged as to allow free circulation of air throughout, and in offering layouts, due consideration is given to climatic conditions in various sections of the country, as sufficient ventilation in one section might be entirely insufficient in another.

Plumbing—Cells are equipped with our special prison fixtures, with either the niche-seated receptacles, or the shielded odorless and ventilated installations.

Sliding Door Locking Systems

Our sliding door locking system operates all doors in the same row by means of one main lever or wheel drive, which is enclosed in a steel control box secured on outside of cage, making contact with the prisoners unnecessary.

By means of this control and the pressure of their respective indexes in the control box, not only may one door, or all doors in a row, be operated at the same time, but any number of them in any desired combination may be operated without disturbing any other door. Indexes in control box indicate by number at all times which doors are open and which are closed.

In addition, cell doors are securely locked in open position exactly the same as they are locked in closed position, thus making it impossible for prisoners to tamper with cell doors while open during daytime to allow prisoners to use exercise corridors, day rooms, etc.

Corridor Entrance Door, Locks, etc.

Entrance doors to prisoners' corridors are secured with tongue and groove at both vertical edges, from top to bottom, the tongue in the front edge being operated by a lever in the control box. In addition, the doors are provided with automatic locks. All door hinges are protected from the inside of cage.

Visaphone

Visaphones are provided for visitors and prisoners to see and converse with each other, but at the same time preventing passage of articles of any sort from one to the other.

Service

We have representatives in various parts of the country, experienced in this special line of work, who will be glad at any time to call in person and submit, free of charge and without obligation on the part of architects, engineers and municipalities, designs and estimates on any requirements, and will cheerfully co-operate with interested parties in the preparation of specifications and layouts. Communicate with us.

Products

STEEL CELLS for penitentiaries, county jails, city jails, village lock-ups.

Hinge and Sliding Type Doors; Locking Devices; Gratings in toolproof, heatproof and Bessemer steels; Bunks, Iron Stairways and all other modern jail equipment.

For our pages on Iron and Chain Link Fences and Gates, see Manufacturers' Index.

Experience

Established in 1886, we have specialized in prison work for nearly fifty years, always keeping abreast of the latest methods and employing experts in every department, from the designing to the finished product.

Many exclusive features are embodied in the construction of Stewart-built prison work.

Factory, Covington, Ky.
(Opposite Cincinnati, Ohio)

Facilities

The plant covers a large ground area and contains over 350,000 sq. ft. of floor space.

Our equipment

Steel Cells in the Virginia State Penitentiary at Richmond, Va.
Manufactured and erected by THE STEWART IRON WORKS COMPANY, INCORPORATED

consists of the most modern machinery, jigs and tools of the most approved type for manufacturing jail and prison work of superior construction.

Our products have been approved by architects, city, county and State officials all over the country.

Materials

All steel utilized in our equipment or construction work is most carefully selected and is purchased in large tonnage from the best known producers of the various kinds of steel used in the different processes of high grade prison construction.

Service

While we do not compete with architects in making plans for prisons, we are always ready to extend to them our complete facilities and experience in designing work, when invited to do so. We solicit correspondence from architects, engineers, and municipalities and will gladly furnish designs, estimates, specifications and layouts to those interested.

Other Features

Many new and important features are included in the manufacture of Stewart Jails and Prisons. Let us present them to you.

Brass and Copper Pipe

Brass and copper pipe and tube are made in many sizes, weights and mixtures for all purposes. They cost more than corrodible pipe, but are in general superior. Instances of exceptional service imposed on brass and copper under severe conditions are their use in condenser tubes, heating coils, boiler tubes and salt water lines.

Brass pipe gives a clean, pure, wholesome, full flow of water—gives it for generations—because for durability in water supply service it is unequalled.

Copper Water Services

Copper is used for service pipes from water mains to buildings, because it is easy to install and eliminates rust troubles and replacement.

The scientific knowledge and the practical experience of our Research and Building Service Departments are at your disposal. We will be glad to consult with you on all problems pertaining to the uses and applications of Copper, Brass and Bronze.

I. P. S. Brass Pipe

Brass (and copper) pipe used for water supply in buildings is of standard pipe size (iron pipe size). It is made in 12-ft. lengths, unthreaded, and is tested to 1000 lb. per sq. in. at the factory. It is sold by weight.

Most fittings are sold by the piece; some are sold by the pound. Weights of brass and copper pipe are given in the table below.

Specifications for Brass (or Copper) Pipe

All water-supply piping shall be of seamless-drawn, semi-annealed brass [copper] of approved manufacture. Each length shall be marked with the manufacturer's name and trade-mark. All fittings shall be of cast brass, malleable pattern, the product of an approved manufacturer.

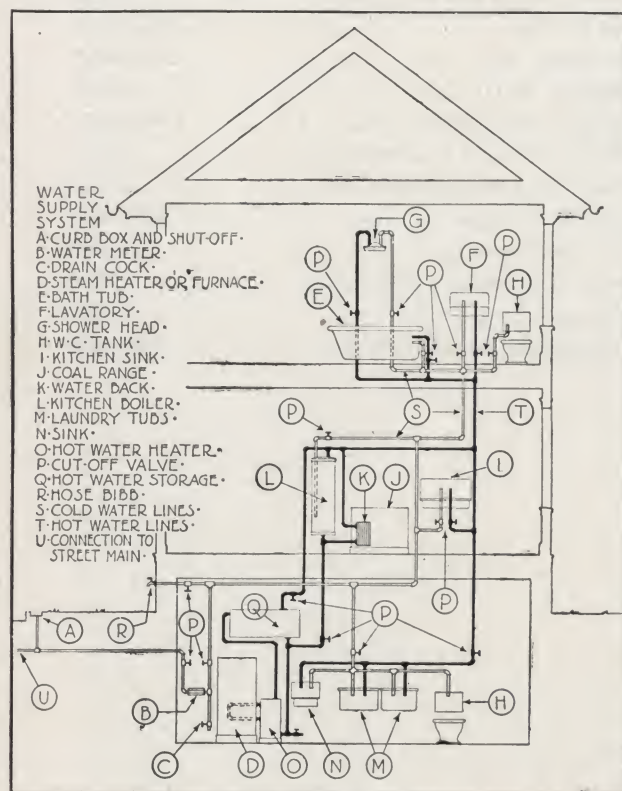

Special Conditions

Where salt water is to be piped or other severe or unusual conditions prevail, architects, building contractors and plumbers are invited to consult the technical staff of the Association.

WEIGHT OF STANDARD SEAMLESS BRASS AND COPPER PIPE
(REGULAR) (IRON PIPE SIZE)

Standard size	Diameter, in.		Pounds per foot*	
	Outside	Inside	Brass	Copper
1/8	.405	.281	.246	.259
1/4	.540	.375	.437	.459
3/8	.675	.494	.612	.644
1/2	.840	.625	.911	.958
3/4	1.050	.822	1.235	1.298
1	1.315	1.062	1.740	1.829
1 1/4	1.660	1.368	2.557	2.689
1 1/2	1.900	1.600	3.037	3.193
2	2.375	2.062	4.017	4.224
2 1/2	2.875	2.500	5.830	6.130
3	3.500	3.062	8.314	8.741
3 1/2	4.000	3.500	10.85	11.41
4	4.500	4.000	12.29	12.93
4 1/2	5.000	4.500	13.74	14.44
5	5.563	5.062	15.40	16.19
6	6.625	6.125	18.44	19.39
7	7.625	7.062	23.92	25.15
8	8.625	8.000	30.05	31.60
9	9.625	8.937	36.94	38.84
10	10.750	10.019	43.91	46.17

*These weights vary somewhat in practice.

The Water Supply Unit

Plumbing Literature

"Practical Brass Pipe Plumbing"—A complete handbook, 5½x8½ in., covering the methods of installing brass pipe, the tools to use and other technical information concerning the work and the materials. It is fully illustrated.

"Brass Pipe and Health"—Relates the adaptability and healthful service qualities of brass pipe for water supply in buildings of every character.

These books will be forwarded upon request.

New York Telephone Company Building
McKENZIE, VOORHEES & GMELIN, Architects

Copper, Brass and Bronze Plumbing in a Modern Skyscraper

In the magnificent new building of the New York Telephone Company at 140 West Street, New York, N. Y., brass pipe is used not only in all hot and cold water lines 3 in. and smaller, but also for the main supplies of the drinking water system. In fact, the major part of all the water pipe used is brass.

To avoid excess pressures the water supply of the building is divided into three sections. The basements

**Interior of Brass Pipe—Note the Absence of
Rust Scale After 30 Years' Service**

Taken from the old building of the Continental Insurance Co., New York, after 30 years of service without repairs

**After 30 Years' Service, Outside of Brass Pipe

Condition of the Thread**

Taken from the old building of the Continental Insurance Co., New York, after 30 years of service without repairs

and first floor receive water direct from the city mains. To supply the upper stories there are tanks located on the seventeenth and thirty-second floors. All piping used in these tanks is made of brass. The floats which control the automatic switches are made of copper and are fastened to woven bronze cables. The switches themselves are enclosed in brass cases for protection against dampness.

Hot water to the 140 West Street building is supplied by five automatic heaters equipped with copper and brass tubing. And for the water supply to the steam boilers brass pipe is used up to 3½ in.

THE AMERICAN BRASS COMPANY

Manufacturers of Anaconda Brass, Copper and Nickel Silver Pipe
WATERBURY, CONNECTICUT

"BROWN & BROTHERS" SEAMLESS DRAWN COPPER RANGE BOILERS.

Also Nickel or Chromium Plated Brass Pipe.

For pages on ANACONDA Architectural Extruded and Drawn Shapes, Sheet, Roll and Strip Copper, and Everdur Metal, see Manufacturers' Index.

Different Water Conditions Require Different Brass Pipe Alloys

The need of going farther afield for water supplies following the growth of urban population, and the growing tendency to treat waters for purity as well as taste, often changes the *character* of the water, which has a direct effect on the durability of pipe materials.

Recognizing that the corrosiveness of water varies greatly, depending on the source and treatment of the supply, THE AMERICAN BRASS COMPANY determined by a series of exhaustive tests and experiments the exact alloys of copper and zinc which most effectively resist various degrees of water corrosion. Many different alloys of pipe, containing from 60% copper and 40% zinc to pure copper, were exposed to the action of highly corrosive water, at a temperature of 70° F. For ten years these pipes remained under the observation of trained metallurgists, and, at the conclusion of the tests, samples were examined and analyzed.

Six years more were spent in checking results by practical tests, and as a result of this 16 years' investigation, THE AMERICAN BRASS COMPANY recommends the use of ANACONDA "85" Red-Brass Pipe for highly corrosive waters and ANACONDA "67" Brass Pipe for normally corrosive waters.

These two grades of brass pipe meet the requirements of U. S. Government Specifications for grades A and B respectively.

Anaconda "67" Brass Pipe

This brass pipe alloy is recommended for distribution lines in the many localities where normal water conditions prevail; that is, when waters are not drawn from peaty sources, shallow wells, tubular wells or filter galleries in lowlands along river beds, and where filtered waters are not of high permanent hardness. ANACONDA "67" Brass Pipe offers permanent immunity to rust-clogged lines which retard the flow of water. Its use for hot and cold water systems effects important economies for the building owner through reduced repair and maintenance expenses.

ANACONDA "67" Brass Pipe meets U. S. Government Specifications for grade B pipe. It contains 67% copper, is semi-annealed, seamless and guaranteed structurally sound and physically perfect.

"Brown & Brothers" Seamless Drawn Copper Range Boilers

THE AMERICAN BRASS COMPANY, having acquired the business formerly conducted by The Randolph-Clowes Company, is continuing the production of the well-known "Brown & Brothers" Seamless Drawn Copper Range boilers.

Anaconda "85" Red-Brass Pipe

The perfect condition of all installations of ANACONDA "85" Red-Brass Pipe substantiates laboratory results, indicating that this is the highest quality corrosion-resisting pipe commercially obtainable.

This pipe is unqualifiedly recommended for distribution lines carrying ground waters and colored surface waters, particularly when drawn from sources of peaty origin, and mechanically filtered waters which may be high in carbonic acid content and low in alkalinity. Also for underground service lines with threaded fittings.

ANACONDA "85" Red-Brass Pipe meets every requirement of the U. S. Government Specifications for grade A pipe. It contains 85% copper, is semi-annealed, seamless and guaranteed structurally sound and physically perfect.

Anaconda Nickel Silver Pipe

ANACONDA Nickel Silver is a white metal composed of copper, nickel and zinc. It is furnished in a wide range of alloys, including Benedict Nickel and Ambrac. ANACONDA Nickel Silver is used in preference to plated metal for exposed piping because it is white clear through, rustless, and has no coating to chip, peel or wear off.

Anaconda Deoxidized Copper Tubes

Deoxidized Copper Tubes for use with threadless fittings are available in straight lengths of 20 ft. and in coils of 45 and 60 ft.

ANACONDA Copper Tubes are made from specially deoxidized copper which improves the physical qualities and corrosion-resistance. Because of their flexibility and the ease with which they are installed, these tubes are advantageously used for service and other underground lines, sprinkler systems, oil burner installations and industrial piping.

Service to Architects

The Technical Department of THE AMERICAN BRASS COMPANY has on hand reliable data on water conditions in many sections of the country, which is available to interested architects. If specific information on water conditions in any locality is not available, THE AMERICAN BRASS COMPANY is prepared to assist in determining the character of the water and recommend the proper grade of pipe to use.

Permanent Identification

The name "ANACONDA" and the numerals "67" and "85" designating the kind of pipe are rolled in the metal every 12 in. This method of marking affords permanent identification and protection for the architect and owner. In addition, a label (reproduced above) is applied to every length. The trademarks "67" and "85" are registered in the United States Patent Office.

Sizes and Deliveries

ANACONDA "67" Brass, "85" Red-Brass and Copper Pipe are made in standard pipe sizes, both regular and extra heavy. Special commercial sizes and gauges can be made to specifications.

ANACONDA Pipe is manufactured and stocked at the mills of THE AMERICAN BRASS COMPANY in Waterbury and Torrington, Conn.; Buffalo, N. Y.; Detroit, Mich.; Kenosha, Wis.; New Toronto, Ontario, and is sold through leading plumbing material distributors everywhere.

This boiler is constructed of two seamless cold drawn shells of ANACONDA Copper and is assembled without a longitudinal seam. Manufactured in capacities of from 30 to 300 gallons.

ESTABLISHED 1851

AMERICAN TUBE WORKS

Seamless Drawn Brass and Copper Pipe

10 Oliver Street, BOSTON, MASS.

NEW YORK, N. Y.

PHILADELPHIA, PA.

Products

SEAMLESS DRAWN BRASS and COPPER PIPE.

Original American Manufacturers of Seamless Drawn Brass and Copper Pipe

For 50 years every length of our brass and copper pipe, iron pipe sizes, has been stamped "A. T. W. Boston" on each end, has borne our green trade-mark as shown below and has been absolutely guaranteed.

Superiority of "A. T. W. Boston" Pipe

The illustrations below are photo-

graphs of brass pipe exhibited at the Sanitary and Efficiency Show held at Pittsburgh, Pa., during the 38th annual convention of the National Association of Master Plumbers. They are given simply to show that seamless drawn pipes made by the exclusive process of the AMERICAN TUBE WORKS (at left of illus-

TRADE-MARK

tration) will stand, before bursting, a pressure which expands the pipe greatly beyond its original diameter—a pressure exceeding by many times any pressure not due to accident or to any extremely severe test. They also show that some seamless drawn brass pipes (at right of illustration and not made by the AMERICAN TUBE WORKS process) do not expand and burst, but simply give way by splitting.

All brass pipe is far superior to iron and steel in non-corrosive quality, but some brass pipe is more reliable than others and more durable under pressure.

"A. T. W. Boston" pipe is tested to

1000 lbs. pressure before leaving the mill. It is positively guaranteed not to split. When specifying this pipe, please call for "American Tube Works Brass Pipe." We shall be pleased to furnish upon application a complete set of our architects' samples of seamless brass pipe, standard iron pipe sizes with weight per foot stamped on each piece, and threaded with standard thread.

Every Length Is Stamped "A. T. W. Boston" on Each End and Bears Our Trade-Mark

Service to Architects and Engineers

Our technical staff is at the disposal of architects and engineers to help them recommend the proper alloy to use for certain locations. This service is available without charge.

Bridgeport Plumrite Brass and Copper Pipe

The superiority of brass and copper pipe for use in plumbing is so well known and has been so universally accepted as the best practice that it need not be discussed here. For the ultimate consumer, who is concerned mainly with the problem of obtaining from a reliable source of supply first class, dependable material that has had a long record of good service behind it, it will suffice to state briefly that BRIDGEPORT BRASS COMPANY has been in the brass business since 1865, a period of 65 years. All the Bridgeport brass and copper pipe for plumbing is trade-marked "Plumrite." Our records enable us to trace back specific instances of early installations in which Plumrite brass pipe has given almost a half century of satisfactory, useful life, which terminated with the demolishing of the buildings in question.

All Bridgeport Plumrite brass and copper pipe is made in electric furnaces and is fabricated in accordance with the best brass mill practice. The finished pipe is furnished in a semi-annealed or soft condition unless special requirements demand a pipe which must take exceptionally severe bends when cold. All pipe is subjected to an internal pressure test of 1000 lbs. per sq. in. at the factory and is carefully inspected to make sure that only high grade material is shipped.

Use the Correct Alloy to Meet Water Conditions

Owing to the fact that water conditions, as far as corrosive action is concerned, vary in different parts of the country, it has been found from experience that certain brass mixtures give better satisfaction and longer life than others. To protect the consumer, who can tell at a glance as to the kind of alloy he is getting, our trade-mark Plumrite, together with the name or percentage of copper, is stamped on each length 9 in. apart, as shown in the illustrations.

We make the following recommendations:

Bridgeport Plumrite Standard

For general good water conditions. Contains approximately 60% copper and 40% zinc. Made by hot working or hot forging process, which refines the grain of the metal and increases its ductility. It is inherently harder and physically stronger than any other of the brass pipe alloys by upwards of 7000 lbs. per sq. in. tensile strength. It threads easily and

freely and does not crush under the action of a vise. Large sized pipe can be bent easily when heated to a dull red heat. It has had an enviable record of long and reliable service and meets A.S.T.M. Specifications B 43-24; U. S. Government Master Specification 342 A, Grade C; and U. S. Army Specification 83-5A, Grade C.

Bridgeport Plumrite 67%

For general good water conditions. Contains 65 to 68% copper. Meets A.S.T.M. Specifications B 43-24; Navy 44P-12, Grade B; U. S. Government Specifications Grade B; and U. S. Army Specifications 85-5A. Can be bent only when cold.

Bridgeport Plumrite Admiralty

For salt water conditions. Recommended for hot and cold sea water, such as is used in some of the Atlantic City hotels. This alloy contains approximately 70% copper, 1% tin and 29% zinc and resists this type of corrosion remarkably well.

This type of alloy is used by both United States and British Navies for condenser tubes. Meets A.S.T.M. Specifications B 44-24 and Navy 44-B-7E.

Bridgeport Plumrite 85%

For corrosive water conditions. Recommended for conditions where water is polluted with acid mine wastes or with organic acid found in peaty soils or with chemicals that purify and soften water. This alloy is very strong and ductile and is becoming increasingly popular for use in underground service lines. Contains approximately 85% copper and 15% zinc.

Also known as red brass. Meets U. S. Navy Specifications 44-P-12 Grade A; U. S. Government Master Specification No. 342 A; and U. S. Army Specification No. 35-5A.

Bridgeport Plumrite Copper

Recommended for corrosive water conditions and for underground service lines. It has not quite the strength nor the corrosion resistance that is possessed by Plumrite 85%. Con-

tains approximately 99.9% copper. Meets A.S.T.M. Specifications B 42-24; U. S. Navy Specification No. 44-P-2C; U. S. Government Master Specification No. 287.

Bridgeport Copper Water Tubing

This is furnished generally in coils and has a wall thickness which is considerably thinner than copper pipe, iron pipe size. Used in connection with compression fittings.

Booklets for Distribution

Water Pipe Sizes—a booklet containing formulae and tables for determining the pipe sizes for water pipes in buildings. It is very useful to engineers for their pipe layouts.

Plumrite Brass Pipe—contains many illustrations of some of our latest installations in the newest of the modern skyscrapers and important buildings.

Bridgeport Copper Water Tubing—a booklet describing this material in detail.

Chase Flexible Copper Water Tubing

A pure *flexible* copper tubing used with compression fittings, primarily for easy and economical replacement of wornout house water lines but adaptable to many other uses. Being 99.9% pure copper it cannot rust; it bends readily, yet is hard enough not to dent or flatten easily. It is freeze-proof and heat-proof. It will stand over 2000-lb. water pressure. It is quick to install because it requires no threading and comes in 60-ft. lengths up to the $\frac{3}{4}$ -in. size which includes the most used sizes, and above that, in 20-ft. lengths.

The same identical type of tubing and fittings has come into quite general use for water service lines from street mains to house meters, and on country estates for service lines from springs and artesian wells.

Flexibility

It can be bent around corners and snaked down through partitions. It will bend to radii of 6 in. and larger, without kinking.

Ability to Stand Pressures

Every length of Chase copper water tubing up to $\frac{3}{4}$ in. is tested to 2000 lb. hydrostatic pressure. (Average city water pressure is 60 to 120 lb.) Sizes above $\frac{3}{4}$ in. are tested to 1500 lb. A line of copper water tubing connected with standard Chase compression fittings, withstood an actual pull of over 2500 lb. without showing any signs of leakage. It has a factor of safety of at least 30.

Freeze-proof—Heat-proof

Freezing water will expand Chase copper water tubing but will not crack it. In an actual test, seven successive freezings expanded the outside diameter of $\frac{3}{4}$ in. Chase copper water tubing about .218 in. but the walls did not crack. It will stand any temperature up to 400° F. (Water boils at 212° F.).

Applications

Rapid strides have been made during the past two years in the use of this new flexible copper water tubing. References to thousands of satisfactory installations can be furnished. Similar material has been used successfully for years, in England and on the Continent.

Ease of Bending Chase Copper Tubing

One knee on the tubing, a succession of short and easy pulls, and a corner is turned without an elbow and without cutting, threading, or time spent in assembling

How It Works

The only tools required for installing Chase copper water tubing are, a hammer, hacksaw, reamer or file, wrench and proper sized flanging tools.

On the average job the plumber throws a coil of tubing on his shoulder and carries all necessary tools in one hand.

Starting at the highest floor to which water is to be carried, he slips a sleeve nut on the tubing, flanges the tube and pulls the sleeve nut up to the body of the fitting with a monkey wrench.

A Chase Copper Water Tubing Plumber

Fully equipped to make an installation

Sectional View of the Flanged Tubing with a Chase Copper Water Tube Union

Snaking Chase Flexible Copper Tubing through the Floor

After a small passageway has been opened through fire stops on the lower floors, one continuous length of flexible copper water tubing can be snaked from the top floor to the cellar.

Then he pushes his tubing down between the partitions to the cellar, cutting in compression tees for lateral take-offs on the lower floors.

In the cellar and likewise under flooring in the upper stories, he *bends* the tubing around corners and obstructions instead of using elbows, which eliminates a lot of fittings and saves labor—no threading, no scrap ends of pipe, fewer fittings.

Where You Can Get It

Chase copper water tubing is distributed exclusively through plumbing supply jobbers who can get it promptly from any one of our eighteen branch warehouses listed at the top of the preceding page.

Compression Fittings

Principal fittings only are illustrated here. Our complete line includes every size and type that would be needed for hooking up an all-new job or replacing only a part of an old installation and connecting up to rigid iron, steel or brass pipe already installed.

Guaranteed

"*Tube and Fittings by Chase*" means one guarantee on both materials. Our name and trade-mark are stamped in every foot of genuine Chase Copper Water Tubing. Chase fittings also carry our trade-mark.

The Chase District Office nearest to you will be pleased to furnish further details upon request.

Typical Cellar Replacement Job

Note the complete absence of elbows at the corners, which means that a lot less labor and fewer fittings are required.

Products

ALPHA BRASS PIPE.

For Chase pages on Copper Roofing Materials and Door Saddles, Bronze and Copper Screen Cloth, Copper Water Tubing and Compression Fittings, see Manufacturers' Index.

Guarantee

Alpha Brass Pipe is fully guaranteed. Defective pipe will be replaced free of charge and if any is found to be defective after it is installed we will pay for new pipe and all reasonable labor costs for removal and reinstalling it.

Differences in Brass Pipes

All brasses, while smooth as glass to the naked eye, are in reality made up of hundreds of thousands of minute irregular shaped particles which in metallurgy are known as "crystals."

There are two distinct types of crystals in some brasses, one, rich in copper with clean cut surfaces and sharp corners, is called "*Alpha*" (Greek: "the first"). The other, poorer in copper and not as regular in shape, is called "*Beta*." Alpha crystals are tough, dense and highly resistant to corrosion. Beta crystals are poorer in copper and are considerably less resistant to corrosion.

Brasses that contain from 56% to 63% copper are made up of both Alpha and Beta crystals. Below 56% copper the resultant brass will be entirely "Beta" and above 63% it will be all "Alpha."

There are two general kinds of brass pipe. One is made of 60% copper and 40% zinc and, as explained above, contains both Alpha and Beta crystals. Alpha Brass Pipe contains approximately 66 $\frac{2}{3}$ % copper and 33 $\frac{1}{3}$ % zinc, and is made up entirely of Alpha crystals.

That is where our Alpha Brass Pipe gets its name; it contains only Alpha crystals that are superior in resistance to corrosion.

Specifications for Brass Pipe

The following form of specification is short and to the point, yet broad enough to insure getting the best for your clients as well as material that the plumber likes.

(1) Pipe—

All hot and cold water supply lines shall be semi-annealed, standard pipe size, brass pipe, containing over 65% copper. The following make is approved:

Alpha Brass Pipe

All pipe must be reamed to remove burrs and cut into the pipe wall so as to slightly flare the opening.

Every length of pipe shall bear the trade-mark or name of the manufacturer and must have been tested to at least 2000 lb. hydrostatic pressure.

Exposed supplies to fixtures shall be chromium [or nickel] plated.

(2) Fittings—

All fittings shall bear the name or identifying mark of a reputable manufacturer and shall contain not less than 70% copper. "Cast" pattern fittings shall be used on all lines 2 in. and larger in diameter; "malleable" pattern fittings may be used on lines 1 $\frac{3}{4}$ in. and smaller.

Each fitting must have been tested to at least 100 lb. air pressure under water, to detect casting defects.

(3) Installation—

All pipe shall be installed in a manner that will permit expansion and contraction without harm to the pipe or joints. Pipe bends must not be left under tension.

No wicking or packing shall be used in joints. Joint compounds, if used, must be applied to pipe threads, not to fittings. No wrenches or tools that will score the pipe shall be used.

Large Stocks for Immediate Delivery

We carry one of the largest stocks of architectural bronze, brass, copper and nickel silver in the East with a variety second to none. Quick shipments and deliveries are thus made possible, regardless of the geographical location of the job or contractor.

In addition to the above we always have on hand for prompt shipment large stocks of rivets and burrs; copper wire and cut nails for slating, roofing and boat building; brass escutcheon pins; bronze and copper tacks; soldering irons, etc.

Bronze

Sheets—Half hard patent leveled and square edged; acid dipped patent leveled.

Rolls—Soft commercial in continuous rolls.

Strips—Commercial drawn with square corners.

Rods—Round, half round, square, rectangular, and hexagon. Round and hexagonal Naval bronze rods.

Tubes—Round, square and rectangular.

Wire—Half hard round and flat.

Channels and Angles—With square edges.

Phosphor Bronze—Sheets, rods and wire.

Brass

Sheets—Rich low, half hard, patent leveled and square edged.

Rolls—For spinning and deep drawing.

Strips—Flat and in coils.

Rods—Round, square, hexagon, half round and half oval.

Tubes—Round, square, rope, reeded and rectangular.

Wire—Hard, spring and rich low soft; high and low round, half round, square and flat.

Angles and Channels—With square edges.

Copper

Sheets and Rolls—Hot rolled; cold rolled; plain, polished or tinned. Sheet and roll copper for roofing and flashing.

Rods—Round, square and rectangular.

Tubes—Round, square, rope, reeded and rectangular.

Wire—Soft, hard or spring; round, square, flat and half round.

Nickel Silver

Sheets—Plain or polished on one side and patent leveled.

Rolls—For spinning or drawing.

Rods—Round, square, half round and hexagon.

Wire—Soft, hard or spring; round, half round, hexagon, octagon, square and flat.

Brass Pipe

We are prepared to make prompt shipment of brass pipe from our large stock. A complete range of sizes is carried at all times.

Bronze and Copper Screen Cloth

We carry a large stock for immediate delivery, in 100-ft. rolls, in widths 18 in. and every 2 in. wider up to and including 48 in., and in 14, 16 and 18-mesh.

Copper Tubing and Service Pipe

For plumbing and underground water service.

Water works officials and municipal engineers are giving serious consideration to the subject of pipe for water service. The chief requirements sought are resistance to corrosion, both internal and external, ductility and facility in making the necessary joints and connections.

Conklin Copper Water Tubing and Service Pipe provide all the above mentioned requisites. Both tubing and pipe bend easily and the use of elbows and fittings is reduced to a minimum. Only a few simple tools are required for installation.

Red Brass Plumbing Method and Copper Service Tube Fittings

A leakproof connection is the best assurance of a troubleproof piping installation. Such connections are provided by Conklin fittings because of their assured *double-seal* feature.

The *double seal* provides *double* strength, safety and ease of installation. The 45° seat of the fitting holds the pipe in a wedge, insuring an absolutely tight seal and the 90° seat locks the pipe, provides a second seal of positive tightness, and protects the 45° seal by absorbing all pulling strains and vibration.

A complete line of tees, elbows, couplings and water works brass goods, as well as separate connections to meet the requirements of any copper service pipe installation, always carried in stock.

Fig. 500

Plumbing Method Tee

"Everdur" (Copper-Silicon-Manganese Alloy)

The addition of silicon and manganese to copper, when their proportions are properly adjusted, produces a copper-rich alloy of the solid solution type and gives to the copper strength approaching that of steel without impairing its non-rusting and corrosion-resistant properties. Products made of "Everdur" alloy are recommended for use where conditions of unusual stress and exposure to severe weather or corrosion must be met with a reasonably priced metal.

A complete line of the following items made of "Everdur" in all standard sizes is carried in stock:

Lag screws; wood screws (round, flat and oval head); cold headed machine bolts; hexagon nuts; lock and flat washers; piston finish rods in 18-ft. lengths and in diameters of $\frac{3}{4}$ to 2 in. for marine shafting and underwater parts.

CRESCENT BRAND BRASS, RED BRASS, and COPPER PIPE.

WAINWRIGHT EXPANSION JOINTS.

Wainwright Hot Water Heaters and Hot Water Heating Systems.

Copper Service Tubing.

Foster Wheeler Crescent Brand Brass Pipe

Crescent brand brass pipe is specially desirable for plumbing and steam work. It is easy threading and gives a clean, sharp thread.

Manufacture—Crescent brand brass pipe is made in the same tube mill that produces the high grade condenser tubing used in the world's foremost condensers. The pipe is made from selected metals only, which are closely checked by chemical analysis before being used. Those not conforming to rigid specifications are rejected.

Most modern methods are used in the manufacture of Crescent brand pipe. Electric furnaces are used in melting the metals so that oxidation and volatilization are reduced to a minimum. High standards in physical properties are thus maintained and specified alloys accurately produced.

The tubing is cold drawn to desired dimensions by successive drawings through highly polished steel dies. After each drawing operation the tubing is annealed, so that the hardness produced by the drawing process is removed. Temperatures are controlled by indicating pyrometers and recording instruments, thereby maintaining an accurate check on heat treatment during the process of annealing. The entire manufacture is under the constant supervision of metallurgists long associated in the wrought brass business.

Guarantee—Every length of Crescent brand brass pipe is guaranteed to be as nearly physically perfect as possible. Successive tests to insure proper hardness and ductility, also pressure tests exceeding many times the conditions of actual service, are applied to all pipe. These tests, coupled with a rigid inspection of all lengths, assure a high class and fully dependable pipe.

The Above Identification Appears on All Foster Wheeler Crescent Brand Brass Pipe

Identification—All Foster Wheeler Crescent brand pipe is readily recognized by the identification (shown below) appearing in approximately every 12 in. of length. This marking permanently identifies all Foster Wheeler Crescent brand brass pipe.

Sizes—Crescent brand brass pipe is made in standard pipe sizes, in regular, extra heavy and double extra heavy. Special sizes and gages made to order.

Delivery—Crescent brand pipe is manufactured and stocked at Carteret, N. J. It is also handled by leading distributors of plumbing materials.

Service—The Foster Wheeler research laboratory, which controls the manufacturing processes of Crescent brand pipe, has collected much material relative to the durability of brass tubing, and to the proper materials and best heat treatment for various services. It will be glad to assist the architect in studying and analyzing his special brass pipe requirements.

Wainwright Expansion Joints

Wainwright multicorrugated copper expansion joints are built for high and low pressure service to take up the expansion in pipe lines carrying steam, hot water or oil.

Wainwright Joints are constructed of seamless copper cylinders with corrugations rolled inwardly to prevent thinning of the metal without restricting the nominal pipe area. The total movement caused by expansion is evenly distributed to each corrugation so that excessive movement is not imposed on any one corrugation.

High pressure joints have equalizing rings on the inside as well as the outside of each corrugation with internal protecting sleeve to minimize frictional loss and to protect the corrugations from erosion.

Low pressure joints are designed for any vacuum and are good for moderate pressures.

HAYS MANUFACTURING COMPANY

Hays Copper Plumbing Method

ERIE, PA.

For Hays Plumbers' Brass Goods, see Manufacturers' Index

Copper Plumbing

The use of pure copper pipe for plumbing is growing rapidly since the introduction of a practical method of installation which makes its cost little more, often less, than the cost of older systems, while the result is permanent, troubleproof piping.

The use of pure copper pipe at a low cost is made possible by compression fittings which eliminate the need for threading the pipe. A thin wall pipe may be used without any sacrifice in wall strength, since the strength of heavier pipe is reduced by the depth of the threads. At the same time this thin wall pipe made of ductile copper greatly simplifies installation. The number of fittings required is reduced and the connections are easier to make.

This system, installed in a workmanlike manner, means an uninterrupted flow of clear, clean water for the life of the building. A great mechanical factor in bringing about this important improvement in plumbing systems has been the Hays Double Seal Connection.

Hays Copper Plumbing Method

This is the name given to copper pipe plumbing installed with Hays Fittings.

No special plans are needed. The installation, as far as the position in the building is concerned, is practically the same as that of any other system.

Copper pipe, being ductile, can be led around obstructions, bends at corners unless very abrupt; cross-overs, etc., can be made without the use of elbows.

Hays Double Seal Connection

This connection provides a double contact between flanged copper pipe and connection by means of a 45-degree angle and a 90-degree angle in the seat. This design insures ample tightness and strength to make a permanently leakproof joint. The flanged pipe is locked easily and securely between the two parts of the connection by tightening the nut section.

The 45-degree angle holds the pipe in a wedge, making a seal that is absolutely tight. The 90-degree angle is the shock absorber. It locks the pipe, provides a second seal of positive tightness and protects the first seal by absorbing pulling strains and vibrations.

Hays Double Seal Connections are accurately machined to match the bore of the copper pipe used, permitting the same full flow of water. Each connection is tested under a hydraulic pressure of 200 lbs. per sq. in. This precaution insures long life and eliminates leaks or breakdown in service. The Hays Double Seal Connection is the standard thread fitting to tie in with present plumbing.

Recommended Service Pipe

With the development of Hays Copper Pipe Plumbing Fittings we sought the best possible copper service pipe and found the quality of Rome Brass & Copper Company products to be of the highest, and in every way

Advantages of This System

This piping system, properly installed, is permanently troublefree and will cause no interruption of the flow of water during the life of the building. If water freezes in copper pipes, they do not burst or crack. Expansion and contraction take place without damage, unless too frequently repeated. There will be no built-up obstacles to block the water at some points and develop noise.

The first cost of this system will usually run just a little higher than the cost of iron or steel, a

little lower than brass.

Considering the permanent service that may be expected from this system without further expense, it will prove to be one of the best investments for the building owner.

Copper pipe will not rust or corrode, the inside walls remain smooth and the water is never discolored nor its force diminished due to deterioration of the piping system.

How the Flange Is Made

The Hays Flanging Tool is driven into the copper pipe; the nut which has been placed on the tubing before the flange is made will be attached to the fitting and when drawn tight, the curved flange is compressed into the 45-90 double seal shown in the other illustrations on this page. The joint is easily made and will be permanently watertight. No threading—no gaskets—no white lead. The only tools needed are hacksaw, file, wrench, hammer and flanging tool.

Flange

Remodeling and Repair Work

The Hays Copper Plumbing Method may be used for the replacement of worn-out piping, and here, in addition to its other advantages, it eliminates most of the tearing up of floors and cutting into walls which is often necessary where rigid pipe is used. Hays Double Seal Connections are the only fittings for copper pipe with standard threading to tie in with present plumbing.

Fittings

Hays manufactures a complete line of Double Seal connections, tees, elbows, couplings, etc., to meet every requirement in the installation of copper pipe.

Booklet

More detailed information about this system will be found in the booklet "The Hays Copper Plumbing Method," A.I.A. File No. 29b4.

most dependable for the purpose. Rome copper service pipe (see index in this volume) is therefore recommended by us for use with Hays Copper Pipe Plumbing Fittings, and a stock is carried in Erie so that the trade is assured prompt service.

Products

PR PIPE (an All-copper Pipe), REVERE BRASS PIPE, TUBES.

For Revere Copper, Bronze and Brass Sheets, Rolls, Rods, Bars, Extruded Shapes, Angles and Channels, Architectural Bronze, Strips, Brass and Copper Rivets and Nails, see Manufacturers' Index.

PR Pipe

(Paul Revere Pipe.)

PR Pipe is an all-copper pipe, manufactured of virgin copper having a purity of 99.9%. It is completely deoxidized and seamless. PR Pipe possesses a gun-barrel finish inside which is free from flaws and imperfections.

It is drawn to accurate gage and annealed to correct temper, which has been determined by careful research.

Physical Properties and Tests—Each length of PR Pipe is subjected to a hydrostatic test sufficient to impose a fibre stress of 6000 lb. per sq. in. PR Pipe will withstand tension tests of over 30,000 lb. per sq. in. as well as exacting bend and flange tests. The high quality and uniformity of PR Pipe is thus assured.

Weights and Dimensions of PR Pipe—PR Pipe is furnished in two tempers. No. 1 soft, is available in straight lengths of 20 ft. and coils up to 60 ft. No. 2 hard, in straight lengths only.

WEIGHTS AND DIMENSIONS OF PR PIPE (PAUL REVERE PIPE)

2	2.125	0.005	14	0.004	2.06	5	520

PR Pipe for House Plumbing—PR Pipe makes an everlasting plumbing system, which may be installed at very reasonable cost.

There is no waste metal in PR Pipe, because the use of compression fittings instead of threaded fittings, eliminates unnecessarily thick walls. PR Pipe, being bendable, is readily installed around obstructions.

Being all-copper PR Pipe will not rust with the most corrosive of potable water.

The ductility of copper renders PR Pipe practically immune from damage by freezing. PR Pipe has been frozen up to 12 times, without expanding to the bursting point.

PR Pipe is also the ideal water service pipe from the city main to house meters as it will withstand the

severe conditions imposed upon this section of water service systems, such as vibration, shifting of soil and dampness and can be readily run around obstructions.

It is also the ideal material for use in watering systems for lawns, gardens, and golf courses.

Copper Plumbing Pipe Specifications

Kind of Pipe—All hot and cold water supply lines and all branches to plumbing fixtures shall be of Copper PR Pipe as manufactured and guaranteed by REVERE COPPER AND BRASS INCORPORATED, Rome, N. Y.

Hard Pipe—All horizontal runs and exposed work where a rigid pipe is desirable shall be of hard temper PR Pipe. The hard pipe shall in all cases be bent and formed with a bending tool.

Soft Pipe—Soft temper PR Pipe may be used when desirable for services, risers, and concealed work.

Guarantee—REVERE COPPER AND BRASS INCORPORATED guarantees that the pipe furnished is of the best quality of material and composition within the specified limits, and that each pipe has been subjected to the specified hydrostatic tests before leaving the mill.

Revere Brass Pipe

Revere Brass Pipe is manufactured in the Rome plant of REVERE COPPER AND BRASS INCORPORATED. Over sixty years of manufacturing experience are behind its quality.

The proportion of metals in the mixture is rigidly maintained to a standard which has been ascertained most suitable for free cutting and bending qualities without sacrifice of strength of resistance to corrosion.

Revere Brass Pipe is manufactured in two mixtures. The standard mixture for ordinary water conditions, and Revere Red Brass for extra corrosive water.

All processes of manufacture of Revere Brass Pipe are subject to careful inspection. Scientific heat treatment eliminates possibility of season cracking. As a final test, each length of Revere Brass Pipe is subjected to an internal hydrostatic pressure of 1000 lb. per sq. in.

The advantages of brass pipe for repair-proof plumbing are too well known to need stressing. However, it is not sufficient to merely specify brass pipe. The finest workmanship demands the best material—Revere Brass Pipe.

Estimates and detailed information will be gladly furnished upon request to any of Revere's divisions or branch offices.

CANADIAN REPRESENTATIVES: MUELLER LIMITED, SARNIA, ONTARIO

The Company

The MUELLER BRASS COMPANY of Port Huron, Michigan, was incorporated in 1917 and was originally a branch of the Mueller Co. of Decatur, Illinois, which was established in 1857. Since 1927, however, the MUELLER BRASS COMPANY has existed as a separate organization. They are considered the world's largest manufacturers of brass forgings and their many products are internationally recognized as being of superior quality. There is hardly a nationally known product in America that contains brass parts in its assembly that does not have some piece of MUELLER BRASS COMPANY manufacture.

THREE GENERATIONS
OF BRASSMAKING

Reliability

The MUELLER BRASS COMPANY's rating in Bradstreet's and Dun's is over one million dollars—first grade of credit. The experience gained over seventy years of manufacture of non-ferrous products is largely responsible for the high quality of Mueller products. Complete control from virgin metal to finished product, including extensive engineering and laboratory facilities, is an outstanding feature in the Mueller organization. No new product is ever put upon the market without having successfully passed tests far beyond those which it would ever be called upon to withstand.

MUELLER COPPER WATER TUBE AND STREAMLINE FITTINGS

Composition

Mueller STREAMLINE Copper Water Tube is of 99.90% copper.

Tube Sizes

Sizes are equivalent to standard iron pipe sizes. 1/4 in. to 6 in. (1/4", 3/8", 1/2", 3/4", 1", 1 1/4", 1 1/2", 2", 2 1/2", 3", 3 1/2", 4", 4 1/2", 5", 5 1/2", 6").

Tube Classifications

General—On account of the many varying conditions in actual use, the MUELLER BRASS COMPANY, after many experiments and tests, furnish copper water tube in three classifications: STREAMLINE Copper Water Tube "Standard," STREAMLINE Copper Water Tube "Extra-Heavy" and "Extra-Heavy—Soft Temper."

STREAMLINE Copper Water Tube "Standard" and "Extra-Heavy" are intended for plumbing, heating and

numerous industrial uses and "Extra-Heavy—Soft Temper" for underground, for repair or replacement work or on new work where bends are intended to be made.

The "Standard" and "Extra-Heavy" classifications of tube are of requisite stiffness for ease in handling and installing, particularly on new or exposed jobs.

Standard—STREAMLINE Copper Water Tube, a hard, thin wall tube recommended for hot and cold water, gas, oil, air, etc., up to 200 lb. operating pressure and on steam (saturated) up to 15 lb. gauge. This tube cannot be bent. It is for use with Mueller STREAMLINE fittings. It is shipped boxed in straight lengths of 20 ft.

Extra Heavy—STREAMLINE Copper Water Tube, a hard, heavy wall tube recommended for hot and cold water, gas, oil, air, etc., up to 500 lb. operating pressure and on steam (saturated) up to 15 lb. on gauge. This

tube can be successfully bent after annealing with a blow torch. It is for use with Mueller STREAMLINE fittings. It is shipped boxed in straight lengths of 20 ft.

Extra-heavy Soft Temper—STREAMLINE Copper Water Tube, a soft heavy wall tube recommended for hot and cold water, steam, gas, oil, air, etc., up to 300 lb. operating pressure and on steam (saturated) up to 15 lb. gauge. For steam pressures in excess of 15 lb. gauge, special fittings can be furnished. This tube can be bent without annealing and is recommended for repair, replacement or for new work where it is necessary to make bends. On certain work where it is considered good practice to make bends in the tube rather than to use elbows, this tube is particularly indicated. When installing this tube it is necessary to use the Mueller Sizing Tool. This material is shipped crated in coils of 30, 45 and 60-ft. lengths, up to and including 1-in. nominal pipe sizes, or boxed in straight lengths of 20 ft.

Streamline Fittings

The new STREAMLINE fitting recently invented by the MUELLER BRASS COMPANY of Port Huron, Michigan, is the most far reaching contribution of the age to the development of the plumbing and heating professions. It is a fitting made for the mechanic requiring the mechanic's skill to install. It is not intended for the jack-of-all-trades, yet is readily installed by the experienced plumber.

The new Mueller STREAMLINE fitting is threadless and is designed to make a conveniently soldered connection to Mueller STREAMLINE Copper Water Tube for plumbing, heating and industrial uses.

The soldering is not done with a soldering iron. The method of connecting is by means of the application of solder wire fed in by the use of a gasoline torch through conveniently placed openings in the fitting.

There are several distinct mechanical features utilized in the construction of Mueller STREAMLINE Fittings. The pipe openings in the fittings are machined to close tolerances and the copper tube, when inserted in the fitting, fits snugly.

The distance to which the copper tube may be inserted in the fitting has been carefully determined and made positive by a shoulder in the fitting itself against which the tube rests. This shoulder is the same thickness as the tube wall, thus insuring a continuous uninterrupted waterway that cuts flow resistance to a minimum. On the outside of the fitting, drilling location spots are placed at convenient points and the mechanic merely drills through the most convenient location to make his opening for feeding in the solder.

The drilling location spots are placed immediately above the solder feed channel (see illustration) so that when the solder is fed in after heating with a blow torch, it is carried around and evenly distributed in all directions by capillary attraction. The tube is thus uniformly soldered to the fitting.

The tapered ends of the fitting, which naturally produce a thin edge, hasten the cooling of the solder at this point and form what is known to the trade as a solder gate.

A joint made with Mueller STREAMLINE Fittings to Mueller STREAMLINE Copper Water Tube is actually much stronger than the tube itself.

OUTSTANDING ADVANTAGES of Mueller Copper Water Tube and Streamline Fittings

The Elimination of Threaded Connections

For generations piping systems (other than cast iron) have required labor consuming threaded connections. The advent of the Mueller STREAMLINE Copper Tubing and Fittings is the first practical solution of a permanently tight, easily made soldered connection. By the elimination of the cut thread the strength of the tube or pipe is not reduced at the connections—the STREAMLINE fitting and the completely soldered connection actually increase the strength of the piping system.

The Soldered Connection—a Mueller Accomplishment

The well known physical law of capillary attraction has been utilized when making a connection with the new STREAMLINE fitting. Capillary attraction is that property which liquids possess of rising or being drawn up through close fitting surfaces or capillary channels. In making a connection with a STREAMLINE fitting to Mueller Copper Water Tube, the solder, when applied at the right temperature, will flow up, down or laterally with equal facility and the plumber installing a pipe in the upper opening of a tee, for instance, has no more difficulty than in the down or side outlets.

The law of capillary attraction is really the basic principle on which the STREAMLINE fitting is constructed and on which it depends for success. The successful application of this natural law in making a connection with Mueller STREAMLINE Copper Water Tube and Fitting depends upon close tolerances and clean surfaces. Mueller STREAMLINE Copper Water Tube is designed for and intended to be used with Mueller STREAMLINE fittings. There is practically no limit to the height to which solder will rise by capillary attraction, depending upon proper working conditions and the uniform application of heat. Experiments conducted in our own laboratory have conclusively shown that solder will rise by capillary attraction a distance of 2½ ft. which, obviously, never would be required in actual practice.

Tests

Expansion and Contraction—Several sections of ¾-in. Mueller Copper Tube were connected with Mueller STREAMLINE couplings making a total length of 36 ft. containing 14 joints. Cold water was run through the tube for 15 seconds alternated with 100 lb. of steam at 339° F. This alternating test of steam

Sectional View of the Finished Job

Connections

The method of making a connection with a Mueller STREAMLINE Fitting to Mueller STREAMLINE Copper Water Tube is by soldering, using Mueller Special Solder, a blow torch and the application of the natural law of capillary attraction.

The fitting is placed on the pipe where required, after a suitable solder paste or flux has been applied, heated uniformly with a blow torch and wire solder fed in at convenient openings for the purpose.

The solder is drawn around evenly in the joint by capillary attraction and in a few moments the connection has been completed.

The solder will flow up, down or laterally with equal facility and the plumber installing a pipe in the upper opening of a tee, for instance, has no more difficulty than in the down or side outlets.

Connections Located in Places Difficult of Access

While the illustration on this page of the plumber making a connection shows him working in an almost ideal situation, there is very little trouble involved even in almost inaccessible places high up on walls or near the ceiling.

In the great majority of cases it is quite possible, after a little careful measuring has been done, to lay out and connect sections of the tubing on the floor or bench.

Procedure

1. Cut tube *square* with fine hack saw (use 28 tooth saw preferably); use mill file to remove burr.

2. Using sandpaper, rub outside of copper tube around the end at least $1\frac{1}{2}$ to $2\frac{1}{2}$ in. until it becomes bright. Do not leave any dark spots. Do not use emery cloth.

3. Use drill to pierce a hole in the uppermost position of fitting which is conveniently spotted for the purpose. This is for feeding in the solder. Caution—Be sure and drill only the uppermost hole.

4. Sandpaper inside of fitting, where tube goes into it, until surface is bright, thus removing any foreign substance.

5. Now apply a light coat of Mueller non-corrosive paste to outside of tube and inside of fitting. Be sure that it is distributed evenly all around (this can be accomplished with ease if you warm fitting slightly with torch).

6. Slip fitting on the tube until it will go no farther and turn back and forth once or twice to further insure an equal distribution of paste.

7. Use only Mueller special solder as it is expressly prepared for this work.

8. Apply the heat around the entire surface of the end of the fitting where the tube is inserted and warm it up gradually. Then hold the flame at the side of the fitting at a point where it also covers the hole and melt off a small piece of solder in the hole itself. Continue to apply the flame until this small piece of solder starts to run into the hole. Then apply more solder until it shows up at the end of the fitting where the tube goes in. (You will then notice that the solder starts to work around the tube, so move the flame down to the end of the fitting gradually and continue to add solder.) Be sure and add enough solder to fill entire inner groove of the fitting, and the space between the tube and the fitting. When the solder shows at the end of the fitting all around the tube, remove the flame and then add more solder until the hole is full. Then take a small cloth and wipe off the surplus solder and flux above the hole and at the end of the fitting, being careful not to move the connection until the solder is set.

9. It is necessary on sizes larger than $1\frac{1}{4}$ in. to move the fitting on the tube when the solder starts in, to break the surface tension and to insure an equal distribution of solder.

10. Allow the fitting to cool slowly. If solder does not show in a continuous ring at the end of the fitting, apply heat where it fails to show, until the solder creeps outwards, forming a small fillet between the end of the fitting and the outside of the tube. Do not apply solder except through the hole.

11. When soldering large sizes, insert wooden plug in tube to stop the draft.

OUTSTANDING ADVANTAGES—Continued from Page 2

and cold water was run continuously until 20,160 complete cycles had been effected. After a thorough inspection there was not the slightest sign of any damage or leak in the connection. This test was a very severe one and in view of the results obtained should satisfactorily answer any questions as to its dependability under service conditions.

Vibration—A test to determine the effect of continued vibration on connections made with Mueller STREAMLINE fittings to Copper Water Tube was conducted as follows:

The test was run on a 10-ft. length of $\frac{3}{4}$ -in. vertical tube which contained nine joints; the lower end was held rigid. The upper end of the tube was attached to a vibrator. The vibrator was set in motion and run continuously day and night for one week. The tube was subjected to 850 vibrations per minute, totaling 8,568,000 vibrations over the test period with not the slightest sign of failure.

Tensile Strength—Two pieces of $\frac{3}{4}$ -in. iron pipe were screwed into a coupling and pulled on the Olsen testing machine. Repeated experiments showed that the threads fractured at about 6,400 lb.

Extra-heavy STREAMLINE Copper Water Tube soldered into STREAMLINE coupling and subjected to the same test resulted in a fracture of the tube itself at slightly over 9,000 lb. but showed not the slightest sign of joint failure.

Deflection or Bending—Two pieces of $\frac{3}{4}$ -in. iron pipe size brass pipe 6 in. long were screwed into a coupling and placed over supports $5\frac{1}{2}$ in. center to center. A deflection test showed that the thread failed at $1\frac{1}{8}$ in. from horizontal.

The same test was carried out on two 6-in. pieces of Standard and Extra-Heavy STREAMLINE Copper Water Tube and after being bent to a 45° angle the joint was still intact.

Radiation

A Mueller STREAMLINE Copper Water Tube and Fitting installation radiates very little heat and in hot water lines, steam lines, etc., can be very often installed without insulation.

Copper heating surfaces are widely used at present, especially in the form of finned tubes for convection heat transfer or as exemplified in the numerous types of automobile engine-cooling-radiators. It is interesting to note that without exception the successful brass and copper surfaces so used for heat transfer must have air traveling over them, and that a current of air always is necessary for successful results, this current being provided either by power-driven fans or by heated flues above the warm surfaces.

The users of the ultra modern concealed heaters built into the walls under the windows of so many residences have learned the extreme importance of the height of the heated flue or drafthead.

When air ceases to travel over the smooth surface of a heated copper tube, heat transfer ceases to a great extent. If the heat transfer by radiation from an ideal black body is called 1.0 the corresponding heat transfer from a polished body is 0.1. If the copper has been heavily oxidized even to the extent of becoming nearly black, its value is only .72. It is fair to say that a copper surface may radiate only about one-ninth as much heat as a corresponding unpainted steel surface such as that of a commercial pipe.

An important point to remember is the fact that the hot exposed surface areas of the thinner, smaller copper tubes will be much less in extent than that of ferrous tubing. In the judgment of many experienced steam fitters and based on several well authenticated installations, which have passed through at least one heating season, the pipe sizes marked on the plans could be reduced at least one size throughout, due to the smooth interior of the tubing and to the absence of turmoil at the recessed fitting. This reduction in size represents, of course, a material saving in installation cost.

It must be remembered that although copper pipe surfaces radiate very little heat, copper itself is a very rapid conductor of heat. Therefore it naturally follows that there is considerably less loss of heat when being conveyed from the point of generation to the points of distribution.

The advantages mentioned above, together with the fact that there is no room required for a wrench grip and that the fitting itself is very little larger than the tube, permits of it being installed close up to walls or ceiling.

Permanence

Made of 99.90% pure copper, Mueller STREAMLINE Copper Water Tube is permanently non-corrosive.

Mueller STREAMLINE Copper Water Tube is hard drawn and is shipped in 20-ft. straight lengths. Being hard drawn it retains its fine straight appearance and when installed there are no kinks, ripples or bends to spoil the effect.

It requires no more hangers or supports than an ordinary iron installation and being lighter, quite frequently, less.

In soft copper pipe installations there is always the danger of driving nails through it during the process of lathing, etc., but with Mueller STREAMLINE Copper Water Tube (Standard and Extra-Heavy) tests conclusively show that its hard surface readily deflects the nail points.

Installations of materials that rust away and corrode will, at best, last but a few years depending upon the nature of the soil or water and will then have to be replaced. In many cases corrosion and rust will start almost immediately, gradually decreasing their service and cutting down the flow capacity. At the end of a few years they have no salvage value.

An installation of Mueller Copper Water Tube and STREAMLINE Fittings will continue to give uninterrupted service during the entire life of the building and its flow capacity remains the same.

Salvage Value

Should it be necessary to tear down a building in which it is installed or to make alterations, a copper tube installation, because of its everlasting life, has a very high salvage value and in almost every case can be installed again without any preparation other than a slight cleaning. The fittings also will be just as good as the day they were first installed and can be again utilized for new work with perfect satisfaction.

Ease of Installation

Mueller Copper Water Tube is considerably lighter in weight than standard steel or iron piping, due to the reduced thickness of the tube walls without reduction of strength. This is not only practicable due to the nature of the material (copper) but no reduction of the original thickness is made by the cutting of thread as is the case with screw connections.

Again much of a STREAMLINE installation may be assembled on the bench or floor and whole sections completed to be coupled later at the most convenient point, whereas with threaded pipe, each section must be added progressively as the job continues or until a union fitting is used.

Competent plumbers find greatly reduced labor costs when Mueller STREAMLINE Tubing and Fittings are installed with the standard Mueller soldered connections.

Space Saving

The new STREAMLINE fittings require less space than any other fittings for the purpose—a great advantage where working room is restricted. They are exceedingly strong and are smooth inside, permitting an uninterrupted flow. Due to the reduced size, the new fitting makes it possible to use the larger sizes of copper pipe in the same space that would be occupied by smaller steel and iron pipe with their standard larger fittings. It is not practical, commercially, to flare copper pipe larger than the 1-in. size and threading copper has always been a rather expensive and difficult matter but with the new fitting which requires neither thread nor flare, the problem in the larger sizes of pipe has been solved.

Cross-over Fittings Eliminated

In large buildings, where there are frequently very intricate systems of piping to lavatories, kitchens, etc., it is often necessary to use a great many cross-over fittings. This is done to avoid weakening joists or studding by cutting into them to permit the pipe lines to cross. Cross-over fittings cut down the pressure of the water until the velocity is almost entirely lost in some of the upper floors.

When Mueller STREAMLINE Copper Tube is used the sections where the lines cross each other may be slightly flattened, thus eliminating the cost of the cross-over fitting and reducing labor to a minimum. The slight amount of flattening necessary on the STREAMLINE Copper tube will not materially affect the flow and will greatly conserve space.

Cost Comparisons

An installation of Mueller STREAMLINE Copper Water Tube and Fittings in average residence buildings in the great majority of cases costs no more than a galvanized iron installation and costs a great deal less than an installation of brass pipe and fittings. It must be remembered that STREAMLINE Copper Water Tube is not connected by threading or flaring and consequently does not require the heavy wall of brass or iron pipe. In larger buildings, however, such as hotels, large office buildings, etc., a STREAMLINE installation may cost from 15% to 30% more than an iron installation, but considerably less than brass. If, however, the fact is taken into consideration that smaller sizes in STREAMLINE Copper Water Tube can be used on hot water lines than corresponding service in iron, together with lower labor costs for installing, and the high salvage value of the copper tube, which is immediately usable for the same purpose, even after it has been in use for years, then the cost is very much lower.

As a matter of fact, some authorities on the subject of non-ferrous conductors claim that two sizes less than the corresponding sizes of iron pipe on hot water lines and one size less

on cold water lines is satisfactory. This condition is chiefly due to the smooth interior of the non-ferrous pipes and the absence of turmoil. This is particularly true in its application to STREAMLINE installations because there is no recess in the fittings themselves, which results in an uninterrupted waterway that cuts flow resistance to a minimum.

Service to Architects

The MUELLER BRASS COMPANY maintains a staff of competent installation engineers, whose services are available in offering suggestions for the guidance of the architect or contractor. Their active co-operation in the initial stages of the larger installations is often very valuable. This service is offered without obligation and is for the convenience of the designing architect or for actual demonstration to the contractor or his workmen to promote the best methods of smooth running efficiency in starting the job.

Literature

Complete data on tests; also catalogs and various pieces of descriptive literature will be sent upon application.

ARCHITECTURAL SPECIFICATIONS

Mueller Copper Water Tube and Streamline Fittings

Note: The majority of STREAMLINE fittings are furnished with the solder feed hole drilled. Fittings on which the position of the solder feed hole cannot be prelocated are furnished with convenient location spots for drilling.

NO. 101, STANDARD

(1) All lines for plumbing and heating, hot and cold water, gas, oil, compressed air and vacuum lines for pressures up to 200 lb., and saturated steam (up to 15 lb. gauge) up to and including 6 in. (equivalent I. P. S.), shall be hard drawn, Standard STREAMLINE Copper Water Tube, deoxidized, analyzing not less than 99.9% Copper, and shall successfully pass a hydrostatic test of 6000 lb. per sq. in. fibre stress; all fittings shall successfully withstand an air pressure test of 75 lb. under water. The STREAMLINE Copper Water Tube and Fittings shall be of MUELLER BRASS CO., Port Huron, Mich., manufacture.

(2) Weights and Dimensions of Standard STREAMLINE Copper Water Tube shall be as given in the table following.

No tube exceeding the O. D. tolerance shown will be accepted.

The weight of the tube shall vary not more than 5 per cent from the weight specified.

The thickness at any point shall be not less than that specified by more than 5 per cent.

Equivalent I. P. S., in.	Wall thickness, in.	Nominal weight pounds per foot of length	O. D. tolerance
3/8	.025	.144	.500 + or - .001
1/2	.028	.203	.625 + or - .001
3/4	.032	.328	.875 + or - .001
1	.035	.464	1.125 + or - .0015
1 1/4	.042	.681	1.375 + or - .0015
1 1/2	.049	.940	1.625 + or - .002
2	.058	1.46	2.125 + or - .002
2 1/2	.065	2.03	2.625 + or - .002
3	.072	2.68	3.125 + or - .002
3 1/2	.083	3.58	3.625 + or - .002
4	.095	4.66	4.125 + or - .002
5	.109	6.65	5.125 + or - .002
6	.120	8.77	6.125 + or - .002

(3) STREAMLINE joints must be made with solder and non-corrosive paste as supplied by MUELLER BRASS CO.

NO. 102, EXTRA HEAVY

(1) All lines for plumbing and heating, hot and cold water, gas, oil, compressed air and vacuum lines for pressures up to 500 lb., and saturated steam (up to 15 lb. gauge) up to and including 4 in. (equivalent I. P. S.), shall be hard drawn, Extra Heavy STREAMLINE Copper Water Tube, deoxidized, analyzing not less than 99.9% Copper, and shall successfully pass a hydrostatic test of 6000 lb. per sq. in. fibre stress; all fittings shall successfully withstand an air pressure test of 75 lb. under water. The STREAMLINE Copper Water Tube and Fittings shall be of MUELLER BRASS CO., Port Huron, Mich., manufacture.

(2) Weights and Dimensions of Extra Heavy STREAMLINE Copper Water Tube shall be as given in the table following.

No tube exceeding the O. D. tolerance shown will be accepted.

The weight of the tube shall vary not more than 5% from the weight specified.

The thickness at any point shall be not less than that specified by more than 5 per cent.

Equivalent I. P. S., in.	Wall thickness, in.	Nominal weight pounds per foot of length	O. D. tolerance
3/8	.049	.269	.500 + or - .001
1/2	.049	.343	.625 + or - .001
3/4	.065	.640	.875 + or - .001
1	.065	.838	1.125 + or - .0015
1 1/4	.065	1.04	1.375 + or - .0015
1 1/2	.072	1.36	1.625 + or - .002
2	.083	2.06	2.125 + or - .002
2 1/2	.095	2.92	2.625 + or - .002
3	.109	4.00	3.125 + or - .002
3 1/2	.120	5.12	3.625 + or - .002
4	.134	6.51	4.125 + or - .002

(3) STREAMLINE joints must be made with solder and non-corrosive paste as supplied by MUELLER BRASS CO.

NO. 103, EXTRA HEAVY, SOFT TEMPER

(1) All lines for plumbing and heating, hot and cold water, gas, oil, compressed air and vacuum lines for pressures up to 300 lb., and saturated steam (up to 15 lb. gauge) up to and including 2 in. (equivalent I. P. S.), shall be annealed, Extra Heavy STREAMLINE Copper Water Tube, soft temper, deoxidized, analyzing not less than 99.9% Copper, and shall successfully pass a hydrostatic test of 6000 lb. per sq. in. fibre stress. (For steam pressures in excess of 15 lb. gauge, Mueller Flared Fittings shall be used.) All fittings shall successfully withstand an air pressure test of 75 lb. under water. The STREAMLINE Copper Tube and Fittings shall be of MUELLER BRASS CO., Port Huron, Mich., manufacture.

(2) Weights and Dimensions of Extra Heavy STREAMLINE Copper Water Tube, soft temper, shall be as given in the table following.

The weight of the tube shall vary not more than 5% from the weight specified.

The thickness at any point shall be not less than that specified by more than 5 per cent.

Equivalent I. P. S., in.	Wall thickness, in.	Nominal weight pounds per foot of length	O. D. tolerance*
3/8	.049	.269	.500 + .000 - .005
1/2	.049	.343	.625 + .000 - .005
3/4	.065	.640	.875 + .000 - .005
1	.065	.838	1.125 + .000 - .005
1 1/4	.065	1.04	1.375 + .000 - .005
1 1/2	.072	1.36	1.625 + .000 - .005
2	.083	2.06	2.125 + .000 - .005

*The O.D. tolerance of the tube may vary from that specified, due to the soft temper. Sizing tools, manufactured by the MUELLER BRASS CO., should be used to insure a perfect fit for each joint prior to soldering.

(3) STREAMLINE joints must be made with solder and non-corrosive paste as supplied by MUELLER BRASS CO.

MUELLER STREAMLINE FITTINGS

Patent 1770852—Other Patents Pending

**90° ELBOW—COPPER TO COPPER**

This elbow is furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

**45° ELBOW—COPPER TO COPPER**

This elbow is furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

**DROP EAR TEE—COP. TO COP. TO INSIDE I.P.S.**

$\frac{1}{2}$ -in. C. to $\frac{1}{2}$ -in. C. to $\frac{1}{2}$ -in. Inside I.P.S.

**DROP EAR ELBOW—COP. TO INSIDE I.P.S.**

$\frac{1}{2}$ -in. C. to $\frac{1}{2}$ -in. Inside I.P.S.
 $\frac{1}{2}$ -in. C. to $\frac{3}{8}$ -in. Inside I.P.S.

RANGE BOILER COUPLING SIZES

$\frac{3}{4}$ -in. C. to 1-in. Outside I.P.S. to $\frac{3}{4}$ -in. Inside I.P.S.
 $\frac{1}{2}$ -in. C. to 1-in. Outside I.P.S. to $\frac{1}{2}$ -in. Inside I.P.S.
 $\frac{3}{4}$ -in. C. to 1-in. Outside I.P.S. to $\frac{1}{2}$ -in. Inside I.P.S.

**COUPLING—COPPER TO COPPER**

Provided with an internal stop or boss situated midway from the two pipe openings. Makes positive the distance to which pipe may be inserted in the fitting. To use the connection as a union coupling, stop can be flattened by placing over a rounded surface such as a pipe or chisel and striking a few light blows with hammer. Furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

**COUPLING—COPPER TO OUTSIDE I.P.S.**

This coupling is furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

COUPLING—COPPER TO INSIDE I.P.S.

This coupling is furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

**ADAPTER—COPPER TO OUTSIDE I.P.S.**

This adapter is furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

ADAPTER—COPPER TO INSIDE I.P.S.

This adapter is furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

**TEE—COPPER TO COPPER TO COPPER**

This tee is furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

**90° ELBOW—COPPER TO OUTSIDE I.P.S.**

This elbow is furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

**90° ELBOW—COPPER TO INSIDE I.P.S.**

This elbow is furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

**TEE—COP. TO COP. TO INSIDE I.P.S.**

This tee is furnished in sizes from $\frac{1}{4}$ to 2 in. inc.

TEE—INSIDE I.P.S. TO COP. TO COP.

This tee is furnished in sizes from $\frac{1}{4}$ to 2 in. inc.

TEE—INSIDE I.P.S. TO INSIDE I.P.S. COP.

This tee is furnished in $\frac{1}{2}$ -in. size only.

**CAP****PLUG**

Furnished in sizes from $\frac{1}{4}$ to 6 in. inc.

RANGE BOILER ELBOW SIZES

$\frac{3}{4}$ -in. C. to 1-in. Outside I.P.S. to $\frac{3}{4}$ -in. Inside I.P.S.
 $\frac{1}{2}$ -in. C. to 1-in. Outside I.P.S. to $\frac{1}{2}$ -in. Inside I.P.S.
 $\frac{3}{4}$ -in. C. to 1-in. Outside I.P.S. to $\frac{1}{2}$ -in. Inside I.P.S.

COHOES ROLLING MILL COMPANY

Manufacturers of Genuine Wrought Iron Pipe

COHOES, N. Y.

Products

GENUINE WROUGHT IRON PIPE, COUPLINGS and NIPPLES.

Guarantee

Cohoes pipe is made from all genuine wrought iron guaranteed to conform with the requirements outlined by the various Societies for Testing Materials and is unexcelled by that of any competitor.

Identification

We were the first mill to brand our pipe in the rolling, while the metal is hot. Every piece of pipe bears the trade-mark "Cohoes" and the year it was rolled which insures to the buyer *genuine full weight wrought iron pipe*.

Fabricating Qualities

The fabricating qualities of Cohoes pipe are one of the most important features of its economic installation. Though its fiber is tough and strong enough to resist all shocks and vibrations, the softness of the metal and its freedom from hard spots makes it easy to cut and thread, saving labor and tools. In these days of high labor costs, this is a most important item.

Natural and Galvanized Finish

Cohoes pipe is produced with a natural iron finish, which is called "black pipe." But when used under severe conditions it is a wise precaution to have it galvanized. Because wrought iron is a more porous metal than steel, it takes or absorbs a greater quantity of the molten zinc. As zinc is not subject to corrosion, this

thicker coating naturally means a much longer life for Cohoes wrought iron pipe.

Inspection and Testing

Every piece of pipe is tested by hydraulic pressure to prove that it is of the Cohoes standard of strength. Several hundred pounds higher pressure than is necessary in actual use is applied to give a reasonable factor of safety.

Exceptional Durability

The more severe the service demanded of pipe, the greater reason to insist upon Cohoes genuine wrought iron pipe. It is built to stand up under conditions where ordinary pipe would quickly deteriorate.

Genuine Wrought Iron Pipe has proved its superiority in use for railroad cars, locomotives, signal pipe and general railroad maintenance.

For the conveyance of gas, water, air, ammonia, salt water and other exceptionally hard usage, Cohoes gives maximum service.

The Service Department

We have a staff of specialists on pipe. They are thoroughly informed by experience and study on the many uses for which pipe is required.

They have at their disposal data that has been gathered from time to time during our seventy-six years of pipe manufacture. They never work on theory. They know the facts about the actual use of different kinds of pipe by demonstrations that have been years in the making.

The services of these experts are free to any one directly or indirectly interested in the use of pipe.

Products

WHEELING "COP-R-LOY," the Copper Alloyed Steel, supplied in Standard Black and Galvanized Pipe, Black and Galvanized Sheets, Special Finished Sheets.

Also Wheeling Steel Pipe, Wheeling Black and Galvanized Steel Sheets, Long Terme Sheets, Locker Sheets, etc.

"Cop-R-Loy" Pipe

"Cop-R-Loy" Pipe provides the composite of all steel pipe qualities and advantages. In addition, it has a copper content by admixture which metallurgical science has established as a means to maximum pipe durability under the majority of, if not all, service conditions. It is pipe you hear discussed frequently and used extensively by request of architects, building and industrial engineers. As a rust retardant under atmospheric conditions it has won distinction under the most treacherous conditions to which pipe can be subjected.

"Cop-R-Loy" Pipe averages approximately 56,000 lb. tensile strength and provides all the structural strength of steel pipe so necessary to present day piping installations. It cuts easily and threads readily without filling dies. Also it is quite readily bent cold. No better pipe for any plumbing, heating or waste lines need be desired.

Cost of "Cop-R-Loy" Pipe

It has been variously estimated that "Cop-R-Loy" Pipe delivers from 50% more service under the most trying conditions to more than double the service in normal usage, based on experience of users.

Its cost represents only a slight advance over that of standard steel pipe, so that in consideration of its qualities and its performance, it is an economical pipe. To use it any-

where for building purposes is to obtain perfect combination of pipe qualities without extravagance in price per foot, in the cost of fitting or the sacrifice of desirable results in plumbing or heating efficiency.

General

"Cop-R-Loy" Pipe has not escaped the inevitable criticism and opposition that spring eternally to meet an innovation of any kind but it is significant that this tubular product, since its introduction to the trades in 1928, has won a wide acceptance and is responsible for a demand that has increased at a rapid rate in every quarter of the country. High pipe quality at a reasonable cost has been recognized with the result that "Cop-R-Loy" Pipe is specified for the largest as well as for the smallest installations.

Identification

Substitutes and imitations are avoided by insisting upon the pipe that has the name "Cop-R-Loy" rolled in the pipe wall. Genuine "Cop-R-Loy" Pipe, in the black finish, has a maroon coating; galvanized "Cop-R-Loy" Pipe, a maroon stripe, in addition to the name.

"Cop-R-Loy" Nipples

Nipples for "Cop-R-Loy" Pipe installations are made of "Cop-R-Loy" Pipe by leading nipple manufacturers. Names on request. Specify "Cop-R-Loy Nipples" throughout.

Full Standard Weights

"Cop-R-Loy" Pipe is available black or galvanized, in the following weights and sizes: Standard, $\frac{1}{8}$ to 12 in.

Wheeling Steel Pipe

Wheeling Steel Pipe is supplied in the same weight and sizes.

The Clay-Jones Apartments,
San Francisco, Cal.

Designed by A. H. LARSEN, San Francisco, Cal.,
Architect

"Cop-R-Loy" Pipe was furnished for the plumbing and heating of this building by RICHMOND SANITARY COMPANY and installed by WM. J. FORSTER COMPANY

Products

J & L TUBULAR PRODUCTS, Standard Weight, Extra Strong, and Double Extra Strong Pipe, Black and Galvanized, for steam, gas, air, water, refrigeration and sprinkler work, fences, railing, etc.

Copper-bearing Steel Pipe, when specified, can be supplied in standard weight, or extra strong black or galvanized.

J & L SEAMLESS TUBULAR PRODUCTS for oil and gas well drilling, pipe line construction and other purposes.

Also J & L Structural Shapes and Fabricated Structural Work, Columns, Girders, Trusses, Plate Work, Tanks, Mill and Factory Buildings; J & L Steel Piling; J & L Wire Products.

For J & L Bars for Concrete Reinforcement, Junior Beams and Light Weight Channels for Stair Stringers and other uses, see page numbers in Manufacturers' Index.

Description

Jones & Laughlin Steel Pipe is made from uniformly good quality of soft weldable steel rolled from solid ingots made to a special analysis which checked over a period of years has proven to be very uniform in quality. The steel pipe produced from this special grade of J & L Steel is soft and ductile, free cutting, strong at the welds, and free from excess scale. J & L Pipe is reasonably straight and free from blisters, cracks or other injurious defects and is well within the allowable tolerances as to dimensions and weights, and true to round in the outside diameter.

Vast resources and complete ownership-control

of every manufacturing process from the iron ore in the ground to the finished products of the tube mills, under an organization which has been producing iron and steel for over three-quarters of a century, assure the production of steel pipe of exceptional quality.

Uniform Quality

Self-owned basic materials and control under one organization of every process from the mining of the ore to the final testing of the finished pipe, result in a high degree of uniformity in the quality of J & L Pipe that could not otherwise be maintained.

Threading

Recognizing that a pipe installation cannot be stronger than the joint, careful attention is given the threading of the pipe with good clean-cut threads fitted with sound couplings correctly tapped to give a tight joint. Soft ductile steel of free cutting quality enables the contractor to cut clean, sound threads on the job.

Galvanized Pipe

The Jones & Laughlin process of galvanizing assures a thorough coating and insures against pipe being clogged with spelter. The surface of the pipe is carefully cleaned so that when the galvanized coating is applied it adheres strongly and does not tend to flake off.

Identifying Marks

The name "Jones & Laughlin" is rolled in each piece of pipe as a means of identifying a quality product carefully made and finished, and rigidly tested and inspected before shipment. Specify J & L Pipe and have a satisfied clientele.

Specifications for J & L Welded Steel Pipe

(1) **Material**—J & L Welded Pipe shall be made from a uniformly good quality of soft weldable steel rolled from solid ingots from which sufficient crop has been cut to insure sound metal in the skelp.

(2) **Process of Manufacture**—Pipe 3 in. and smaller may be made by the butt-welding process. Pipe over 3 in. shall be lap-welded; also smaller sizes as listed, when ordered as lap-welded pipe.

The welding shall be performed in accordance with the best practice in heating and rolling.

(3) **Physical Properties**—The steel used in the manufacture of the pipe shall show the following physical characteristics:

Tensile strength per sq. in.—minimum 50,000 lb.

Yield point per sq. in.—30,000 lb.

Elongation in 8 in.—20%.

(4) **Finish**—The finished pipe shall be commercially straight and free from injurious defects. All burrs at the ends of the pipe shall be removed.

Threads shall be in accordance with Briggs standard, and cut so as to make a tight joint when the pipe is tested at the mill to the specified internal hydrostatic pressure. The variation from standard, when tested with a standard working gage, shall not exceed a maximum of one and one-half turns either way.

Couplings shall be of sound metal, free from injurious defects, and tapped to such pitch diameter as to make a tight joint.

Galvanized pipe shall be coated with zinc by the hot-dipping process. The coating on the inside and the outside of the pipe shall be free from injurious defects, excessive roughness, or lumps.

Solid tapped rings or split couplings shall be provided as thread protectors on each length of pipe 4 in. and larger.

(5) **Tests**—Each length of pipe shall be subjected at the mill to the hydrostatic test pressures per square inch as shown in the appended table.

For lap-welded pipe, a flattening test on standard weight and extra strong pipe in sizes over 2 in. shall be made by taking a section of pipe 6 in. long, which shall be flattened between parallel plates until the distance between the plates is one-third the outside diameter of the pipe, with the weld located 45° from the line of direction of the applied force, without developing cracks.

Tension test specimens shall consist either of pieces of pipe in full cross-sections, or of sections machined longitudinally from the walls of the pipe.

One tension test, and one flattening test as specified for the respective sizes, may be made on a length of pipe in each lot of 500 lengths or less of each size.

(6) **Size Variation**—Pipe 1½ in. or under shall not vary at any point more than ¼ in. over nor more than ⅜ in. under the nominal outside diameters as shown in the table. For pipe in sizes 2 in. and over, the outside diameter shall not vary more than 1 per cent over or under the standard dimension shown in the table.

(7) **Inspection**—When so desired, pipe may be inspected at the mill, in which event the inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the pipe ordered. The manufacturer shall afford the inspector, free of charge, all reasonable facilities to satisfy him that the pipe is being furnished in accordance with these specifications. All tests and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

Material which shows injurious defects subsequent to acceptance at the manufacturer's works, or which proves defective when properly applied in service, may be rejected and the manufacturer shall be notified.

READING GENUINE PUDDLED WROUGHT IRON PIPE, sizes $\frac{1}{8}$ to 24 in., outside diameter.

Also, Puddled Wrought Iron Nipples and Couplings; Reading Charcoal Iron Boiler Tubes, "Old Hickory" Bar Iron and Reading Cut Nails.

Reducing Operating Costs with Puddled Wrought Iron Pipe

When pipe is considered as an item of *operating* expense—as it should be—the importance of long lasting, corrosion resisting pipe, such as Reading Genuine *Puddled* Wrought Iron Pipe, is immediately apparent. Experience has shown that pipe which is not resistant to corrosion, or which fails for some other reason, increases the operating costs of a building enormously, often necessitating replacement of the entire pipe system within a relatively short period of time. Because Reading 5-Point Pipe, under ordinary conditions, lasts as long as the building in which it is installed, you can be certain that it will reduce pipe operating costs to the minimum.

Specific Advantages of Genuine Puddled Wrought Iron

Reading Genuine *Puddled* Wrought Iron Pipe, produced by the original puddling process, possesses five specific advantages over other ferrous pipe. First, this pipe is remarkably resistant to corrosion, due to the filaments of silicious slag uniformly and minutely distributed throughout every part of its structure. These filaments, overlapping, present a barrier which rust does not penetrate. Second, Reading 5-Point Pipe is *fibrous* in structure—not crystalline—and is therefore immune to the effects of strain and metal "fatigue." Reading 5-Point Pipe makes permanently leakproof joints because of its superior threading ability. In addition, Reading 5-Point Pipe is remarkably easy to weld, and holds paint or other coatings permanently.

With a fibrous structure and a melting point approximately 300 degrees higher than that of ordinary pipe, Reading Genuine *Puddled* Wrought Iron Pipe possesses a distinct advantage in resisting the destructive effects of high temperatures. Reading 5-Point Pipe does not oxidize as rapidly as ordinary pipe under excessive heat, and therefore will not scale or be reduced in thickness so quickly.

All lapweld pipe, as made by the READING IRON COMPANY, is *double welded*—an operation which is unique with this company. The practice of double welding all lapwelded tubular goods assures a more perfect weld and a more uniform length of lap throughout the entire length of the pipe being welded. It provides extra strength—tests show that the welds of Reading 5-Point Pipe are as strong as the unwelded parts.

Made by a Time-tested Process

For more than eighty years, the puddling furnace—where the hot, pure pig iron and silicious slag are worked together by *constant agitation*—has been the accepted method of manufacturing genuine *puddled* wrought iron. Numerous attempts have been made to duplicate this process by other methods, but none of these methods has stood the test of generations of service—the only true test of pipe vitality.

It should be noted that the wrought iron pipe that is still serving in buildings which have endured for more than half a century was made by the *puddling* process which the READING IRON COMPANY has used since 1848.

All Reading Pipe Is Marked with the Reading Name, Date of Manufacture, and Indented Spiral Mark

Furnished with threads and couplings and in random lengths unless otherwise ordered.

Weights and dimensions are nominal.

Weight per foot of pipe with threads and couplings is based on a length of 20 ft., including the coupling, but shipping lengths of small sizes will usually average less than 20 ft.

Permissible variation in weight is 2 1/2 % below and 5 % above weights given in tables.

All weights are figured on the basis of 1 cu. in. of wrought iron weighing .2778 lb.

All pipe threaded to Briggs' standard gauges as made by Pratt & Whitney Co., Hartford, Conn.

For cut lengths, an extra charge will be made above random lengths.

For pipe smoothed on the inside (known as plugged and reamed) an extra charge will be made above standard pipe.

For galvanized or coated pipe an extra charge will be made above black.

When ordering sizes 8 to 12 in., please state weight of pipe wanted.

Extra strong and double extra strong pipe will be shipped in random lengths and with plain ends unless otherwise ordered.

All weights and dimensions are nominal.

Random lengths extra strong and double extra strong pipe are considered to be 12 to 20 ft.—5 % may be 6 to 12 ft.

If fitted with threads and couplings, an extra charge will be made above regular. When extra strong or double extra strong pipe is ordered with threads and couplings, regular line couplings will be furnished, unless otherwise specified.

For cut lengths, an extra charge will be made above random lengths. For galvanized or tar coated pipe, an extra charge will be made above black.

There is 5 % permissible variation in weight from above extra strong sizes—10 % on double extra strong.

Specification of Reading Genuine Puddled Wrought Iron Pipe

To assist buyers in securing genuine *puddled* wrought iron pipe, READING IRON COMPANY urges the adoption of the following model specifications where pipe of long life and ultimate economy is desired.

Material—All black and galvanized pipe, nipples and couplings shall be Reading guaranteed quality genuine *puddled* wrought iron standard, full weight, made from best grade pig iron by the process of puddling, and no scrap or cuttings except crop ends from the sheet or crop ends of the pipe shall be used in the manufacture.

Trade or Identification Marks—All pipe, nipples and couplings must bear the spiral diamond design identification mark rolled on the outside surface.

The design shall be so placed that the mark can be quickly identified, regardless of at what angle the pipe, nipple or coupling may be placed.

Pipe—All pipe 1 1/2 in. and smaller, standard and special sizes, shall be butt welded (1 1/4 and 1 1/2 in. where specified can be lap welded).

All pipe 2 in. and larger, standard and special sizes, shall be lap welded. All in accordance with the best methods and practice.

Nipples—All nipples shall be cut from the same quality and weight as described and specified in the above specification.

Couplings—All couplings shall be the same quality of material and made by the same process as that of genuine *puddled* wrought iron pipe described above. Couplings for oil country goods must be made from double refined genuine *puddled* wrought iron. Threads must be clean cut, tapped straight through, and of such pitch diameter as will make a tight joint; the ends must be countersunk. All couplings longer than 4 in., and all oil country couplings must be full taper-tapped on each end, facial and recessed.

From Mine to Consumer

This company controls and operates the manufacture of its products from the mines to the consumer, therefore

is able to produce a commodity that is of a high standard and uniform quality.

WHERE AND WHEN REPUBLIC PIPE SHOULD BE USED

It is rather difficult to recommend uses of tubular products that will hold true in all localities because of the varying degrees of corrosive action. In addition, some jobs are speculative and the additional cost of a better material is not warranted. However, in general, the following uses are suggested to the architect who has a pipe installation problem.

Heating

Excessive Corrosion—Where excessive corrosion will be encountered, black standard weight Toncan Copper Mo-lyb-den-um Iron Pipe or black extra strong wrought steel pipe should be used and will justify the slightly higher cost.

Ordinary Conditions—Where all piping, risers and returns are subjected to ordinary conditions, black standard weight wrought steel pipe is suggested.

Plumbing

Excessive Corrosion—Where hot and cold water lines and general plumbing installations are subjected to high corrosive action, galvanized standard weight Toncan Copper Mo-lyb-den-um Iron Pipe is most suitable.

Atmospheric Corrosion—Where atmospheric conditions cause corrosion on tubular products, it is suggested that galvanized standard weight copper bearing steel pipe be used.

Ordinary Conditions—Where pipe is subjected to ordinary usage and corrosion is light, black standard wrought steel pipe will ordinarily be satisfactory.

Vents, Drainage and Down-spouts—Tubular products for such uses are subjected to atmospheric corrosive action which suggests the use of galvanized standard weight copper bearing steel pipe. When such corrosive action is light, galvanized standard weight wrought steel pipe will usually suffice.

Fire Lines—Where water pressures are not excessive, black standard weight wrought steel pipe is recommended. Where water pressure is heavy and fire laws demand, black extra heavy weight wrought steel pipe is suggested.

Sprinkler Systems—Black standard weight wrought steel pipe for all piping.

Gas Lines—Black standard weight wrought steel pipe for all piping.

Toncan Copper Mo-lyb-den-um Iron Pipe

Toncan is primarily a corrosion resistant material, being a pure iron alloyed with copper and molybdenum. Better grain refinement can be secured in iron when a small amount of molybdenum is present. This improvement in grain structure has an important bearing on strength and ductility and has been proven a definite aid to corrosion resistance. Toncan threads, bends, flanges and coils easily.

Toncan is recommended where highly corrosive conditions are encountered and where a slightly increased initial cost is warranted; this in most instances will be equalized by increased life of the installation.

Identification—Every length of Toncan Iron Pipe is marked with a blue stripe, and the name Republic in raised letters. Couplings are blue and stamped RT.

Republic Copper Bearing Steel Pipe

This type of material is suggested for installations comparable to atmospheric corrosive conditions. The long exposure tests of the American Society for Testing Materials prove beyond question that copper, when added to steel, is a decided benefit in resisting this type of corrosive attack. The increased cost is a sound investment which yields increased life of installation.

Identification—Each length is properly identified "Republic Copper Bearing Steel Pipe," with no possibility of confusion at the time of installation or inspection by the architect.

Republic Wrought Steel Pipe—Butt and Lap Welded

This pipe is made from uniformly good quality soft weldable wrought steel, rolled from solid ingots. Sufficient crop is cut from the ends to insure sound material, and the steel is given the most approved treatment in heating and rolling. Every piece is carefully inspected and tested. Republic Wrought Steel Pipe threads, flanges and bends easily.

Identification—Each length of pipe is identified with the name "Republic" rolled in raised letters every 3 ft. of length.

SPECIFICATIONS UNDER WHICH REPUBLIC WROUGHT STEEL WELDED PIPE IS MANUFACTURED

The manufacturers of Republic Pipe have adopted a rigorous system of testing and inspection that practically makes it impossible for inferior product to pass. The system insures the best of material and workmanship. While every precaution is taken to guard against inferior material entering into the manufacture, a most rigid inspection is made after the welding of the skelp into the pipe, for it is quite possible to deteriorate the best of material in the process of welding.

In order to insure first class product without necessarily increasing the cost of manufacture, we have adopted and recommend the following specifications:

Process of Manufacture—All pipe shall be made either by the lap or butt-weld process as specified on order, according to the best methods and practice.

Surface Inspection—The pipe must be reasonably straight and free from blisters, cracks or other injurious defects. Liquor marks incidental to the manufacture of lap-welded pipe will not be considered as surface defects. The pipe shall not vary more than 1% either way from being perfectly round or true to the standard outside diameter, except on the small sizes (1½ in. and smaller) where a variation of ⅛ in. will be accepted. The pipe must not vary more than 5% either way from standard weight.

Threading and Reaming—When required, the pipe must have a good Briggs standard thread. The threads must not vary more than 1½

turns either way when tested with a Pratt & Whitney Briggs standard gauge. All burrs at ends to be removed.

Internal Pressure Test—The test pressures will be applied to the respective sizes of standard butt and lap-weld pipe as indicated in tables.

Testing of Material—The steel from which the pipe is made must show the following physical properties:

Tensile strength..... 52,000 to 62,000 lb. per sq. in.
Elastic limit..... not less than 30,000 lb. per sq. in.
Elongation in 8 in..... not less than 20%
Reduction of area..... not less than 50%

A test piece cut lengthwise from the pipe and filed smooth on the edges shall bend, without fracture, through 180 degrees with an inner diameter at the bend equal to the thickness of the material.

Couplings—The material to be sound and free from injurious defects. Threads must be clean cut, tapped straight through, and of such pitch diameter as will make a tight joint. Ends must be countersunk.

Thread Protection—Solid tapped rings or split couplings will be provided as thread protectors on all sizes 3½-in. diam. or larger. Protection will be provided for smaller sizes when called for on order.

Additional Specifications—In addition to the above, Republic Pipe is manufactured in accordance with all standard specifications such as, A.S.T.M., A.P.I., etc.

*Item now obsolete.

The permissible variation in weight is 5% above and 5% below.

Furnished with threads and couplings and in random lengths unless otherwise ordered.

For cut lengths, an extra charge will be made above random lengths.

For pipe smoothed on the inside, known as reamed and drifted, an extra charge will be made above standard pipe.

For galvanized or coated, an extra charge will be made above black.

Taper of threads is ⅜ in. diam. per ft. length for all sizes.

Products and Facilities

SPANG CHALFANT WELDED and SEAMLESS TUBULAR STEEL PRODUCTS, including Standard, Extra Strong and Double Extra Strong Pipe, both black and galvanized, for all purposes and Spang "Copper-Clude" Pipe.

This company is the oldest pipe mill operating in America and has a record of many years of satisfactory service to users of tubular products of all kinds and for all purposes. Its present facilities include plants for the manufacture of butt weld $\frac{1}{8}$ to 3-in. inside diameter, lap weld $1\frac{1}{4}$ -in. inside diameter to 24-in. outside diameter, inclusive, and seamless $1\frac{1}{2}$ -in. inside diameter to 16-in. outside diameter, inclusive, pipe.

claim for damages beyond the price of the tubular goods will be considered and no charge for labor or expense of repair will be allowed.

Identification of Pipe

All Spang Chalfant Pipe, whether welded or seamless, carry the following identifying marks:

Welded Pipe—All welded pipe, in sizes $\frac{1}{2}$ in. and larger is marked with the name "Spang" rolled into every length during the process of manufacture.

Seamless Pipe—"Standard" seamless pipe is marked with a designating mark "Standard" stamped into the finished product.

"Spang" Welded Pipe

"Standard" Seamless Pipe

Spang "Copper-Clude" Pipe

Inspection

Every piece of pipe, tubing or casing is carefully inspected during process of manufacture and is tested and inspected after all the operations are finished. All imperfections that are possible to detect are therefore found and eliminated.

Guarantee

We guarantee to replace such goods as prove defective, or allow credit for same, at our option. No

"Copper-Clude" Pipe—Spang "Copper-Clude" is a new trade-name for steel pipe which has a percentage of pure copper added. This pipe is soft, easy to work, but highly resistant to corrosion, making it ideal for exposed piping jobs where severe atmospheric conditions are present (alternate wet and dry, etc.)

To identify—Spang Black "Copper-Clude" is solidly enameled maroon; Galvanized "Copper-Clude" carries two bright maroon stripes the entire length of each piece of pipe.

Information of Value When Specifying or Ordering

The following information, some of which pertains to the tables below, will be found of value when specifying or ordering pipe.

All weights given in tables are limited to three decimal points and are figured on the basis of 1 cu. in. of steel weighing .2833 lb.

All material will be cut to length, when so ordered, with extreme variation not exceeding $\frac{1}{8}$ in. over or under, unless otherwise arranged. All pipe is threaded to American Standard (Briggs) working gages as made by Pratt & Whitney Co.

Pipe and tubing are known and spoken of by their nominal inside diameters from $\frac{1}{8}$ to 12 in., inclusive and by their nominal outside diameters above 12 in. inside diameter. Where pipe and tubing, heavier than standard, are specified the extra thickness is on the inside reducing the inside diameter of the

pipe. All dimensions are subject to change without notice.

Where $\frac{1}{8}$ to 12-in. pipe is to be finished with threads and couplings and where orders specify quantity in lineal feet, random lengths fitted with threads both ends and coupling one end will be shipped and measurement charge from end to end, including coupling. Where cut lengths are specified order must state whether plain ends, threads only or threads and couplings are required. Sizes from 14 in. up are customarily held in stock in plain ends and orders should specify whether plain ends, threads only or threads and couplings are desired.

When figuring on lineal feet of pipe for long lines allowance should be made, on pipe fitted with threads and couplings, for the distance pipe is screwed into coupling, when assembling, usually one-half length of coupling.

*These sizes eliminated from general production September 1, 1927. Permissible variation in weight is 5% above and 5% below for extra strong pipe; 10% above and 10% below for double extra strong pipe.

Furnished with plain ends and in random lengths, unless otherwise ordered. Random length of extra strong and double extra strong pipe is considered to be 12 to 22 ft.; we have the privilege, however, of sup-

plying not exceeding 5% of total order in lengths from 6 to 12 ft. For pipe fitted with threads and couplings, an extra charge will be made above plain ends. For cut lengths, an extra charge will be made above random lengths. For galvanized, or coated pipe, an extra charge will be made above black. Taper of threads (when threaded) is $\frac{3}{4}$ in. diameter per foot length for all sizes.

Manufacturing Facilities

Owning its own ore and coal mines, manufacturing its own coke, pig iron and steel, and equipped with complete research, laboratory and inspection organizations, as well as the most modern machinery, THE YOUNGSTOWN SHEET & TUBE COMPANY is in a position to serve the trade with products unexcelled.

Of equal importance is the well established policy of co-operation with customers by furnishing only materials of the highest quality.

Youngstown products have been in use all over the world for more than a quarter of a century, and the high reputation they enjoy has been earned by satisfactory performance. They may be regarded as thoroughly dependable and the equal of similar products made anywhere.

Youngstown Pipe

Youngstown Pipe is the principal product of the company. Its output of this material is approximately 1,390,000 tons annually, and includes pipe for all purposes and in all standard sizes of butt-welded, lap-welded and seamless (both Pilger and Automatic process). Youngstown Pipe is made of the best tube steel that can be manufactured and with utmost care in regard to details. It is a product of uniformly high quality.

Youngstown Copperoid Pipe

Believing that many architects, engineers, contractors and others interested in pipe installations are not thoroughly familiar with the qualities of copper steel pipe, it is felt that the following information will be of interest and value.

THE YOUNGSTOWN SHEET & TUBE COMPANY was one of the first steel manufacturers in this country to manufacture copper steel and the first to use copper commercially in steel pipe. Copper steel was first made by this company more than seventeen years ago in the manufacture of its various products, such as sheets, wire, bars, rods, etc., and the word "Copperoid" was registered in the United States Patent Office July 13, 1915, by THE YOUNGSTOWN SHEET & TUBE COMPANY as a trade-mark for its copper steel products. Late in 1915 THE YOUNGSTOWN SHEET & TUBE COMPANY began the commercial manufacture of Youngstown Copperoid pipe for special orders. Since its inception, tests and experiments calculated to establish its value as a resistant have continued, with the one thought in mind of producing a product worthy of the name "Youngstown." As a result of these investigations, the most desirable percentage of copper and the best procedure of producing copper steel products have been determined.

It was established early in these tests that all Copperoid products possessed a decided advantage in their resistance to atmospheric corrosion, and now, after nearly fifteen years, this has been found to be definitely proven.

In 1916 the American Society for Testing Materials began atmospheric corrosion tests on uncoated ferrous sheets, simultaneously at Pittsburgh, Pa., Fort Sheridan, Ill., and Annapolis, Md. These districts were selected as having industrial, rural and salt water atmospheres, respectively. The metals in this test consisted of wrought iron, open-hearth iron, Bessemer steel and open-hearth steel containing no copper, also the same metals containing copper in varying amounts. Although all of these metals had not gone to destruction, it became necessary to abandon the tests at Pittsburgh and Fort Sheridan after a period of several years as the government required the land for other purposes. The results of these tests thoroughly showed the superiority of copper steel above all other materials in the tests, and the test in progress at the other location corroborates these findings. (See Annual Reports of A.S.T.M. Committee A-5, on Corrosion of Iron and Steel.)

Other investigations have shown the success of Copperoid Steel when subjected to such corrosive agencies as aqueous solutions of sulphuric acid, vapors of sulphur and steam in sulphur mines, water containing hydrogen sulphide, coal mine water, complex mixtures of hot water, steam and vapors of organic acids, such as pyroligneous acid, turpentine, solvent naphtha and pile oil at 250° F., sea water, sea air, salt water conditions in oil wells, and acid conditions in general, whether organic or mineral, soil or water.

Special attention is called to the adaptability of Youngstown Copperoid Pipe for shipbuilding purposes, such as in plumbing and heating, hand rails, masts and booms, vent pipes, etc., around shipyards, docks, wharf-warehouses, etc.

Youngstown Copperoid Pipe is available in both black and galvanized in all standard sizes.

Youngstown Square and Rectangular Tubing

Youngstown Square and Rectangular Tubing is manufactured from fine tube steel and furnished cut to any length desired.

Square tubing is made in 1, 1¼, 1½, 1¾, 2, 2½ and 3-in. sizes. Rectangular tubing sizes are 1½x1¼, 2x1¼, 2x1½, 2½x1½, 3x2, 4x2 and 4x2½ in.

The 2½-in. size square tubing and the 2x1¼, 3x2, 4x2 and 4x2½-in. size rectangular tubing are each offered in one weight only. Other sizes of both square and rectangular tubing are furnished in a number of weights or thicknesses, depending on the service requirements. For sizes that are made in more than one weight, the thickness or weight desired must be specified.

Youngstown Buckeye Conduit

Youngstown Buckeye Electrical Conduit is the most widely used material of this kind made in this country. It is made of specially selected Youngstown Pipe, carefully and thoroughly

Buckeye Conduit

enameled or electro-galvanized coated. It is regularly tested and inspected by The Underwriters' Laboratories, Inc., and is used extensively on government work. Youngstown Buckeye Conduit is a product of uniform excellence entitling it to the

approval of the most careful engineer. We are the most extensive manufacturers of rigid steel conduit in the world.

The enameling is baked on Youngstown Buckeye Conduit and all electro-galvanized conduit is given an additional exterior coating of special transparent enamel.

Youngstown Steel Sheets

Recent additions to our equipment for the manufacture of sheets enable us to produce numerous kinds of steel sheets formerly not manufactured by us, including full-finished and special-finished sheets, oven-lining sheets and the galvanized sheets, as well as a number of different styles in roofing and siding.

Youngstown Sheets

Youngstown Copperoid Steel Sheets

In Youngstown Copperoid Steel, a material has been developed which resists corrosion under exposure to the atmosphere to such a surprising degree that it should receive special attention from all engineers preparing specifications for steel roofing, siding, cornice work, steel window frames, sash, metal lath, and all other work in which metal sheets are used.

Exhaustive tests conducted by The American Society for Testing Materials have demonstrated the rust-resisting qualities of Youngstown Copperoid Steel to be far superior to those of plain carbon, so-called "pure irons," made in open hearth furnaces, or in fact, any other metal at approximately equal cost. Full information on this subject can be had on application or by reference to the reports of this test as published by the Society.

Youngstown Galvannealed Sheets

A heat-treated galvanized steel sheet that lends itself admirably to the many new duco paint and enamel finishes. Youngstown Galvanized Sheets are coated by a patented process which gives them a dull rather than a bright spangled appearance. The coating adheres closely to the base metal and adds greatly to its rust resisting qualities. Forms splendidly and can be soldered as well as any galvanized sheet. Furnished with plain or "Copperoid" steel base, both grades being very reasonably priced. Obtainable in widths up to and including 48 in. and in lengths up to and including 144 in.

Youngstown Automobile Sheets

Youngstown Automobile Sheets are used by leading manufacturers whose output covers a wide price range. Our mills are fully equipped with every facility for meeting ordinary or special requirements for bodies, hoods, fenders, doors, aprons, cowls, splash guards, etc.

Youngstown Furniture Sheets

Many of the leading metal furniture manufacturers throughout the country are using Youngstown Furniture Sheets.

Since every element is under our control, and every facility for manufacture now known is at our command, we have a decided advantage in filling orders for users whose requirements are such as demand careful adherence to specifications, prompt shipment and general excellence.

Youngstown Special Finished Sheets

Youngstown Sheets can be furnished with any desired special finish obtainable in steel sheet metal manufacture.

Identification

Youngstown Steel Pipe, Youngstown Steel Sheets, and Youngstown Copperoid Steel Sheets are plainly marked. In pipe, the name is rolled in the steel. On sheets, it is stenciled in the usual manner on the first sheet in each bundle.

Sizes and Weights

All of these products are regularly manufactured in standard sizes and weights, but can be furnished to meet special requirements within reasonable limits. They can be obtained from leading jobbers and dealers in all parts of the United States, as well as in most foreign countries.

Additional Information Supplied on Request

This company is always glad to furnish detailed information concerning any of its products, and to render any assistance possible to engineers who communicate with it direct or with any of its sales offices as listed herewith.

Write for catalogues on any of the products in which you are interested.

Also F. & W. Trade-Mark Cast
Iron Combination Vent, Revent and
Drainage Fittings; Universal Cast Iron
Pipe and Fittings; Monitor Service,
Curb and Roadway Boxes with "Stay-on"
Covers; Central Drain Traps.

Structural Advantages of Nuhub Trade-Mark Soil Pipe

THE CENTRAL FOUNDRY COMPANY, one of the largest foundry organizations in the world, has produced what is claimed by architects, engineers, builders and plumbing contractors as the most perfect pipe ever offered the building industry for vertical and horizontal lines in buildings and under the ground—soil lines, waste lines, leader lines, vent lines, house drains and house sewers.

NUHUB is a cast iron soil pipe designed especially to overcome all shortcomings of old style soil pipe. It embodies strength where strength is most needed. The accompanying illustrations show how NUHUB is strengthened at the exact location where old style soil pipe is weakest—at the base of the hub.

Note the bead at the base of the hub. This bead assures double strength where the hub and the barrel of the pipe meet. This hub meets all requirements for proper pipe hanging in steel and reinforced buildings.

The Led-LoK groove inside of the hub is another successful improvement in soil pipe design. The lead, poured in the usual manner, becomes locked in this groove immediately upon cooling and cannot work loose. NUHUB lead joints can be thoroughly calked without splitting the hubs. No gaskets to eat away and cause settlement of stack and breakage of branches.

Dimensions, Diameters, and Thicknesses

The dimensions, the diameter and the wall thickness of NUHUB Soil Pipe and NUHUB Fittings are strictly in accordance with "Naco" specifications, the recognized and accepted standards for soil pipe and fittings the country over.

Every length of NUHUB Soil Pipe is tested under 50 lb. hydrostatic pressure.

NUHUB

TRADE-MARK REG. U. S. PAT. OFF.

SOIL PIPE

Made in extra heavy, medium and standard weights.

Price is no higher than that asked for old style pipe.

Handled by wholesalers of plumbing supplies.

Reinforced Hub Takes No More
Wall Coverage Than Ordinary
Soil Pipe

No. 1. Nuhub Soil
Pipe

The Led-LoK is the one lead groove worthy of Nuhub Soil Pipe and Fittings. The lead cannot work loose. No gaskets to eat away and cause settlement of stack and branches

No. 2. Old Style Soil
Pipe

Compare No. 2 with No. 1. Note thin easily broken wall at base of hub in old style pipe. See how this glaring weakness has been eliminated in Nuhub Pipe and Fittings

Identification

The bead at the base of the hub on NUHUB Pipe and Fittings is a protection against error and substitution, and a distinctive and permanent mark of identification that can always be seen after the pipe is installed.

Specifications

Soil pipe and fittings for soil lines, vent lines, waste lines, leader lines, house drains and house sewers shall be NUHUB Trade-Mark Soil Pipe and Fittings (weight of pipe in accordance with plumbing code requirements) as manufactured by THE CENTRAL FOUNDRY COMPANY.

GENERAL CERAMICS COMPANY

Manufacturers of High Grade Acidproof Chemical Stoneware

225 Broadway
NEW YORK, N. Y.

SAN FRANCISCO, CAL., 276 Monadnock Building

CHICAGO, ILL., 208 South La Salle Street

MONTREAL, QUE., 1111 Beaver Hall Hill

PLANTS AT KEASBEY and METUCHEN, N. J.

Products

HIGH GRADE ACIDPROOF CHEMICAL STONEWARE manufactured by the GENERAL CERAMICS COMPANY has been specified as standard equipment in many large chemistry and physics laboratories in both the United States and Canada. It is also being used in leading hospitals, newspaper plants, photo-engraving shops and other establishments where corrosive fluids are used.

Advantages

Sinks, drain lines and ventilating ducts made of this ware are absolutely unaffected by any of the chemicals met with in industrial work, as it is the material in which such chemicals are manufactured. Equipment made of General Ceramics High Grade Chemical Stoneware for handling corrosive materials is, therefore, practically indestructible and is the most permanent part of the entire building construction. Alternative materials, such as so-called acid-resisting metals or alloys, sewer tile, soapstone, enameled metals or inferior chemical ware, that are resistant to certain chemicals but are rapidly eaten away by others, must be replaced at intervals and are a constant expense for repairs and upkeep. Such alternative materials are frequently more expensive than the General Ceramics High Grade Chemical Stoneware.

This stoneware is a dense granite-like mass covered with an acidproof glaze serving only to give it a smooth attractive finish, the ware itself being acidproof all the way through. It is the strongest of all materials made from clay, yet it can be readily cut with a sharp chisel without danger of splitting on account of its homogeneous texture.

Installations

Among the many important buildings that have been equipped with GENERAL CERAMICS COMPANY ware are the chemistry laboratories of Yale University, Harvard University, Walter Reed Hospital, New York Times Building, Curtis Publishing Building, New York

Assay Office and the Metropolitan Life Insurance Building.

The manufacture of the highest quality of chemical stoneware is a somewhat protracted process that cannot be hurried without detriment to the product. The time required for manufacture varies from six to ten weeks, depending on the dimensions and the shapes required. We endeavor to carry at all times an ample stock of all standard equipment, but orders should be placed in sufficient time to allow for the manufacture of specials.

Specifications

In order to be sure of getting a permanent installation of acidproof chemical stoneware, specifications should read:

All parts of this installation subject to the action of acids or acid wastes are to be made of high grade acidproof chemical stoneware manufactured by the GENERAL CERAMICS COMPANY of New York, N. Y.

Service

Our Engineering Department is prepared to assist in laying out chemical stoneware installations and in the design of special equipment.

Write for catalogue showing our complete line, dimensions, etc., also price list.

What Duriron Is

Duriron is a hard, close grained cast metal that is resistant to the action of practically all corrosives used commercially or in the laboratory.

Despite the similarity of names, Duriron should not be confused with iron. In analysis it differs more from iron than bronze from brass. Its signal advantages over other materials for acid handling are its greater strength, its universal resistance, and the fact that it does not depend on a coating, lining or glaze, but is wholly and equally resistant clear through its structure.

Corrosive Tests on Duriron

In 1919 tests were made on Duriron over a period of 120 days duration, using all of the corrosives in general commercial use. The tabulated results of these tests are given below, from which it is proved that the life of Duriron pipe handling corrosive wastes is virtually unlimited.

A 5% solution of hydrochloric acid shows the greatest percentage of loss, but computations prove that it would take about 350 years for that acid to corrode Duriron to a depth of 1 in.

Solution	Per cent of loss	Depth of corrosion in inches, per year
95% Sulphuric acid007	.0000206
25% Sulphuric acid016	.0000463
10% Sulphuric acid025	.0000685

A number of Duriron installations carrying the most corrosive liquids have been in service for over ten years, and show no signs of deterioration. We have a great volume of data on the corrosion of other materials, and this is at all times available to the architect.

Duriron Engineering Service

Our extensive experience with all conditions in the handling of acids and acid wastes, and our familiarity with building and plumbing codes and regulations, enables us to offer valuable co-operation in the layout of acid waste lines; to make definite recommendations on ventilating problems, and to be of help in all matters where corrosion must be considered. We shall be glad to make specific recommendations as to which lines and fittings should be Duriron in any given installation, but for preliminary plans or estimates the following general recommendations will be found of value.

Duriron Should Be Specified

For the waste lines from educational, hospital and industrial laboratories. In structures devoted to crafts, such as: photoengraving, electroplating, etc. In loft buildings devoted to general manufacturing. Battery repair stations. In commercial kitchens where drainage of corrosives is extensive. This is particularly true of the garbage "raking pan" drainage. Wastelines from industrial plants whose processes require the use of corrosives.

For sink outlets, traps, horizontal piping and stack entrance fittings in medical buildings housing physicians, surgeons and dentists. House drains for combination sanitary and acid wastes.

Waste lines through cinder concrete, and similar situations where corrosion attacks on outside of pipe.

Exhaust fans and ducts for removal of corrosive fumes from chemical hoods, laboratories, pickling rooms, etc.

Roof vents exposed to coal smoke and moisture, or extreme atmospheric corrosion of any sort.

All wastes where absolute insurance against failure is important, due either to corrosion or rust; such as memorials, public buildings, and those erected to endure indefinitely.

Typical Specifications for Duriron Drain Lines

(1) Pipe—All pipe and fittings carrying acid waste from to shall be of Duriron as manufactured by THE DURIRON COMPANY, INC., Dayton, Ohio, of the sizes shown on drawings

(2) All such pipe and fittings shall be of bell and spigot type, extra heavy weight and dimensions, and shall fulfill the requirements of the city plumbing code of the City of

(3) **Joints**—All joints in lines carrying acid wastes shall be made by ramming tightly in bottom of bell one ring of pure asbestos wick packing, upon which shall be poured sufficient molten lead to fill the bell completely, the lead being properly calked in the manner usual with cast iron soil pipe.

(4) **Cleanouts**—Suitable cleanout plugs shall be provided as shown on drawings.

(5) **Expansion Joints**—If lines are to handle wastes of high temperature, expansion joints shall be provided as shown on drawings.

(6) **Alignment**—All pipe lines shall be correctly aligned before joints are made. Proper supports shall be provided; at least one support to each length of pipe in horizontal lines, one at each bend, and supports at intervals no greater than 10 ft. in vertical lines.

(7) **Floor Drains**—Floor drains in shall be of Duriron, double drainage type, Plate No.

(8) **Vents**—Vent lines carrying acid fumes shall be of Duriron as specified for pipe above. (Unless fumes are of extreme strength other materials may be used.)

(9) **Sinks**—All sinks in shall be of Duriron, of the sizes and shapes as shown on detail drawings. Each sink shall bear the name "Duriron" cast thereon. Sink outlets shall be of Duriron.

(10) **Sink Connections**—All connections from sinks to waste lines, including traps, shall be Duriron as specified.

(11) **Exhaust Fans**—All exhaust fans for exhausting acid fumes from hoods, together with all suction and discharge pipes connected therewith, shall be of Duriron. Such fans shall be of the type, size and capacity as shown on drawings.

Important—It is important that the location of floor outlets follow exactly the specifications in laboratory installations.

If this is not done within close limits, the laboratory furniture can not be properly located. Inaccurate location of floor openings by the plumbing contractor offers an excuse to the furniture contractor to substitute an inferior material to offset the extra fitting work made necessary by this deviation.

Duriron Drain Pipe

Advantages—

Easily installed and familiar work to plumbers.

Duriron pipe joints, properly made, *stay tight*; this is a serious limitation in other materials used to handle acid and acid waste.

Requires no protective coating inside or outside. Not necessary to encase in concrete, provide drip pans, or otherwise prepare for failure. Elaborate supports not needed.

Lines may be concealed in walls and ceiling when desirable.

Fills all code requirements for sanitary drain, and may be used for dual service of acid and sanitary line, saving an extra line. No other material may be so used.

Does not warp nor sag from heat. No discoloration of walls when run in partitions. Takes paint readily when desired for decoration.

Permits the location of a department such as a laboratory anywhere in the structure.

Complete stocks always maintained, assuring immediate deliveries.

Duriron pipe joints, properly calked, will not loosen under ordinary building vibration. Its hardness is such that it is not scoured by sharp solids carried in solutions. Duriron drain lines, once installed, are permanent. They may be concealed in walls and floors without fear of disfigurement from leaks, and consequent tearing out of finish. Not requiring asphaltum coating, there is no wall discoloration.

Cost—

Compared to extra heavy cast iron soil pipe, the cost of a Duriron pipe installation, including labor, is about three times as great. This cost is but a small fraction of one per cent of that of the building, and it assures permanent freedom from repairs or replace-

ments due to corrosion, in addition to insuring the finish from damage by leaking waste lines. After one replacement of a cast iron line the costs are about equal, and it should be remembered that replacement follows numerous repair jobs. With other materials, repairs and replacements afford only temporary relief, and are a continuous charge on maintenance.

Pipe Installation—

Duriron drain pipe is installed the same, as easily, and with the same labor cost as cast iron soil pipe. No special instruction to plumber is necessary.

Joints should be packed with asbestos wick packing rather than hemp or oakum, which are not acid-proof.

Any pure asbestos is suitable, but not always obtainable. For this reason we manufacture a specially treated pure asbestos packing for this purpose.

Comparative Physical Tests—

The Testing Laboratories of Columbia University some years ago made an exhaustive series of tests, both chemical and physical, on vitrified tile, lead and Duriron pipe. The chemical tests show Duriron far superior in universal resistance. The physical tests are summarized below:

COMPARATIVE PHYSICAL PROPERTIES DURIRON, LEAD AND VITRIFIED TILE PIPE

From Tests made by Testing Laboratories of Columbia University

	Vitrified Pipe	Lead Pipe	Duriron Pipe
Average ultimate crushing load, lbs. per ft.	1556	1492	13490
Average transverse ultimate load, lbs., center load, span 21 in.	1813	400	11250
Modulus of rupture, computed from crushing load, lbs. per sq. in.	1644	*	17200

*Impossible to compute for a plastic material such as lead.

Immediate Shipments—

Complete stocks of Duriron drain pipe and fittings are always maintained in all sizes to, and including, 8 in. The 10, 12, and 15-in. sizes are supplied promptly on order. Stocks available in Dayton, Chicago, New York and San Francisco.

Duriron Ventilating Fans

Ventilation of laboratories, laboratory hoods, pickling rooms, and places where it is necessary to remove corrosive and noxious fumes, require an exhauster that will not be affected by the gases handled. All parts of Duriron fans that come in contact with the fumes carried are of Duriron, and are unaffected by vapors or condensate.

This type of equipment is used only for bettering atmospheric conditions and is usually located in an inaccessible position and should, therefore, operate with the least amount of attention. Duriron fans are of simple and sturdy construction.

They may be furnished for either direct connection or for belt drive. They require no coating or painting of the exposed surfaces, and give continuous and efficient service with little care other than lubrication.

These fans are built in four sizes, having approximate capacities of 60, 450, 1500 and 4000 cu. ft. per minute.

Literature—Duriron Bulletin No. 140-B, "Exhaust Fans," contains complete specifications and capacities of Duriron ventilating fans. (Size 8x10½ in., A.I.A. File Number 30dl.)

Products

ACID-PROOF DRAIN PIPE and FITTINGS (all extra heavy); EXPANSION JOINTS; ASBESTOS PACKING.

ACID-PROOF VENTILATING FANS.

LABORATORY EQUIPMENT, including Sinks, Outlets, Traps, Floor Drains, Beehive Strainers, Overflows, Glass Cleaning Kettles, Kjeldahl Apparatus, etc.

Acid-proof Pumps, Valves, Cocks, Tank Connections and Outlets, Flanged Pipe and Fittings, Ejectors, Kettles and Special Castings.

What Duriron Is

Duriron is a hard, close grained cast metal that is resistant to the action of practically all corrosives used commercially or in the laboratory.

Despite the similarity of names, Duriron should not be confused with iron. In analysis it differs more from iron than bronze from brass. Its signal advantages over other materials for acid handling are its greater strength, its universal resistance, and the fact that it does not depend on a coating, lining or glaze, but is wholly and equally resistant clear through its structure.

Corrosive Tests on Duriron

In 1919 tests were made on Duriron over a period of 120 days duration, using all of the corrosives in general commercial use. The tabulated results of these tests are given below, from which it is proved that the life of Duriron pipe handling corrosive wastes is virtually unlimited.

A 5% solution of hydrochloric acid shows the greatest percentage of loss, but computations prove that it would take about 350 years for that acid to corrode Duriron to a depth of 1 in.

Solution	Per cent of loss	Depth of corrosion in inches, per year

Hemispherical Laboratory Sinks

Duriron hemispherical sinks or bowls are finding great favor in chemistry laboratories when used in fume hoods or in tops of tables. When set in a hood, one bowl should be placed in each compartment, recessed so that the top of the sink rim is slightly below the working surface. A drainage groove should be provided in the floor of the hood, sloping to the sink across the rear of the hood. When used in the tops of chemistry tables, these sinks replace the trough and should be spaced so that one sink is within reach of each student or chemist. Their use in the tables avoids the necessity of repairs which so frequently occur in stone or lead troughs, and provides greater cleanliness.

Duriron Expansion Joints

Since the coefficient of expansion of Duriron is much greater than that of cast iron, special provision must be made when drainage systems are subject to unusual variations in temperature. The Duriron expansion joint is designed and used for such cases.

Duriron Expansion Joint

The length of this expansion joint is the same as a full piece of corresponding pipe so that it may be installed without difficulty. Made in 3, 4 and 6-in. sizes which weigh 70, 85 and 150 lb., respectively. These sizes are carried in stock, others made to order when required.

Particulars of Installation—Care must be taken to provide suitable anchors for the pipe line at points midway between expansion joints. In extreme cases it may also be necessary to provide locking clamps at all pipe joints. Our experience on this point is available without obligation.

Duriron Rope Asbestos Packing

The Duriron asbestos packing is made from commercially pure asbestos, and is treated with special mate-

rials to make it most desirable for acid service. So that the correct amount may be calculated for the work, the following table of requirements per joint is given:

Duriron Rope Asbestos Packing

Pipe size, in.....	1 1/2	2	3	4	6	8
Weight per joint, lb...	0.14	0.16	0.22	0.26	0.35	0.44
Length, in.....	10	12	16	19	26	33

Note: 100 ft. (1200 in.) of this packing weighs 16 lb.

Pure asbestos rope should always be specified for use in place of hemp or oakum to secure an acidproof joint. This is for the reason that hemp or oakum is soon destroyed by the action of acids, allowing the joint to leak.

In the packing of a joint, in order to make sure that there is no open space left when this packing is put in the bottom of the bell or hub, we recommend that the packing be separated into two or three strands and laid in so that the ends will overlap, and surely make a joint all the way round.

The amounts of packing given above, when calked in tightly, fill up the bell or hub from 1 1/2 to 1 3/4 in. from the top, which space is left for the lead backing.

Other Laboratory Equipment

Many educational and hospital laboratories have occasion to perform protein, nitrogen or ammonia determination by the Kjeldahl digestion process. For this purpose, there is available a complete Duriron digestion equipment of novel design which does not require the use of a hood. It is described in Bulletin No. 139 which also discusses the application. Large laboratories often find it desirable to provide a container for hot chromic acid in which is cleaned the glassware. Duriron jacketed kettles, heated by steam or hot water, are available in two standard sizes, 13 and 35 gal. Drawings of these will be furnished on request.

Guaranty

Knight-ware is guaranteed to be acid proof throughout the entire body, free from defects and satisfactory in every respect.

Knight-ware will withstand the action of acids, alkalis, chemicals, and all corrosive solutions and gases, weak or strong, hot or cold.

Its acid proof qualities do not depend upon any glaze, enamel or veneer, "It is the body itself."

supply any type connection desired and offer several standard connections from which to choose. We also make up special types to order.

Bell and spigot pipe are available in any bore and in all standard fittings. Special fittings made to order. All bells are deep and well grooved permitting tight packing.

Each piece fully covered by our guaranty.

Where Knight-ware Is Used

Knight-ware is used extensively as plant equipment in the manufacture of acids, alkalis, chemicals and corrosive solutions and gases.

Because of the readiness with which Knight-ware lends itself to various shapes and designs, it is used as equipment for almost every purpose involving the use of acids and corrosive agents. It is especially adapted for acid proof sinks, waste lines and fittings, ventilating lines, sumps or catchbasins, as well as many other types of apparatus for high school, college and university laboratories, hospitals, newspaper buildings, and any other buildings where acid and corrosive solutions are used and acid proof waste, sewer or ventilating lines are necessary.

Knight-ware Pipe and Fittings

The bell and spigot type of connection is shown on the following page. This design is the one generally employed for laboratory use, although we are able to

Knight-ware Sinks

Because of the great diversity of shapes and sizes in which laboratory sinks are required by colleges, universities, commercial and private laboratories, it has been found inadvisable to carry any so-called standard sizes in stock. We make sinks to your order from your prints and specifications and to suit your requirements exactly. *Because Knight-ware sinks are entirely hand-made, it costs no more for this service.*

Knight-ware sinks are made in one piece and are not slabs bolted or cemented together. All faces are smooth and well glazed, corners are well rounded and, in general, every precaution is taken to see that they are easy to clean and keep clean. Outlets to the sinks are ordinarily made as an integral part of the sink itself, so that no separate outlet connections have to be purchased. If required, we can also manufacture outlet connections separately.

Knight-ware sinks are fully guaranteed acid proof, free from defects and satisfactory in every respect.

Knight-ware Sink Set-up, Johns Hopkins University

For Estimates on Laboratory Sinks

We ask that you give us the following detailed information:

(1) Length, width and depth, inside of sinks. (2) Bore and position of outlet. (3) Type of outlet, length, and outside diameter of pipe. (4) Size and depth and kind of rim, if rim required. (5) Height, thickness and width of back, if with or without faucet holes and position of same (if back is required). Also, if back is to be an integral part of sink or a loose plate. (6) Size, width, length and thickness, also design, and number and size of grooves of drainboard, if drainboard is required. (7) Number of sinks required. (8) Preferably a pencil sketch with the measurements or a blue print of the sink and attachments required.

Products

"CORROSIRON" ACIDPROOF DRAIN PIPE and FITTINGS for drainage purposes.

"CORROSIRON" ACIDPROOF DRAIN PIPE and FITTINGS for drainage purposes are produced and controlled to an analysis specified by New York state and city authorities, which specifications have been followed by other leading municipalities.

"Corrosiron" a Process

"CORROSIRON" is a high silicon acid resisting cast iron, which has been produced, marketed and successfully used for over fifteen years.

"CORROSIRON" is a process, not a mixture or formula, developed and controlled by the PACIFIC FOUNDRY COMPANY, LTD., as one of their several similarly developed products, under both metallurgical and foundry supervision, including alloys prepared in the electric furnace and special moulding appliances and methods.

"CORROSIRON" was developed about the year 1913 when improved processes in the manufacture and use of sulphuric and nitric acids called for a material which would withstand corrosion, could be cast into various designs and would be strong enough to withstand moderate pressures and temperatures.

The corrosive actions of different solutions vary greatly while passing through drains, so it is not possible to predetermine the life of the pipe, but the facts are that "CORROSIRON" will result in prolonging the life of the drainage system because of its acid and alkali resistance.

Conditions of Installation

"CORROSIRON" drain pipe and fittings present no unusual problems of installation, excepting that lines should be secured or anchored closer than cast iron. Standard extra heavy drain pipe dimensions have been closely followed; pipe can be cut on the job and joints are made with molten lead and lead wool, caulked and tested as usual. It is advisable to caulk asbestos into the bottom of the bell before pouring lead so as to protect the lead from corrosion.

Chemical Tests for "Corrosiron" Resistance

Below is given the results of tests made by Government chemists, university chemists and chemical laboratories. These tests cover long periods in solutions at room temperature and losses figured in depth of corrosion per year.

Solution	Depth of corrosion in inches per year
95% Sulphuric acid	H ₂ SO ₄0000208
25% Sulphuric acid	H ₂ SO ₄0000291
10% Sulphuric acid	H ₂ SO ₄0000173

CORROSIRON

We are pleased to furnish on request round discs of "CORROSIRON," weighing about 80 grams, which will be found to be suitable for testing under any specific conditions. We are also pleased to furnish upon request, various special shapes of "CORROSIRON"—such as pipe sections, small pots or kettles, and other designs—which will enable any one interested to determine just what can be expected of the metal.

A Partial List of Services

Cascade Pans—Concentrating sulphuric acid.
Pulsometers—Pumping nitric acid in large powder plants.
"S" Bends—Nitric acid condensers in powder plants.
Powder Plant Apparatus—Used in nitric, sulphuric and mixed acids.
Agitator Head, Blades—Used in standard agitators in corrosive solutions.
Anode Plates—Various sizes up to 30x36 in. in successful use.
Nut Guard—Making possible the use of wrought iron bolts in acid.
Flanged Pipe, Fittings—In general use for piping acids, alkalis and corrosive mixtures.
Drain Pipe and Fittings—Drains in chemistry laboratories, schools, colleges and commercial plants.
Tubes—For contact plants.
Drain Lines—For the cannery.
Bell and Spigot Pipe—For non-corrosive piping where flanged pipe is not suitable.
Valves and Cocks—For use in corrosive lines carrying sulphuric and nitric acids, alkalis and fruit juice mixtures.
Cast Threads—For special uses threads are being cast.
Nitric Acid Clamp—For use on glass tubes from pulsometers.
Paddles, Exhaust Fans, and Tanks—For photo-engraving establishments.
Acid Coolers—Used for cooling nitric and sulphuric acid after concentration.
Acid Eggs—Special types and shapes for every use.
Tower Sections—Complete sections for denitrating towers.
Pots and Kettles—Patterns in stock for various sizes and many types.
Heating Units—Special types for acid work.
Acid Recovery Parts—Special castings.
Acid Ejectors—Used for pumping with low heads. Inexpensive operation.
Pyrometer Tubes—To protect pyrometers from corrosives; 12 to 60 in. long.
Hooks—For suspending metals in corrosive solutions.
Filter Parts—Valve heads in boracic acid.
Roaster Blades—Used for rabbling corrosive sulphides in circular roaster.
Parting Dome Covers—Domes, covers and downtake show practically no wear after years of service.
Chute Sections—For delivering ores combined with acid mine water.
Pipes and Valves—For use in the tannery.
Pumps—Both centrifugal and plunger types for pumping sulphuric and nitric acids or other corrosive acid or alkaline liquors.
Pump Plungers—In mine waters and leaching plants.
Other "CORROSIRON" manufactured parts are covers for concentrating pans, spray nozzles, steam jets, troughs, battery grids, baffle plates, etc.

Stock Available

"CORROSIRON" bell and spigot drain pipe and fittings of dimensions of the gray iron extra heavy standard are carried in stock. Also laboratory sinks, sink connections, strainers, etc.

Stocks are carried at the principal points of the United States.

"CORROSIRON" chemical castings, special castings, split flanged pipe, split flanged fittings, pumps, valves, etc., can be furnished to order and from stock.

Prices and complete details furnished on request.

THE U. S. STONWARE CO.

Manufacturers of Guaranteed Acid-proof Chemical Stoneware

WORKS (SINCE 1865)

AKRON, OHIO

NEW YORK OFFICE: 50 Church Street

Acid-proof Chemical Stoneware Laboratory Sinks

U. S. Standard Chemical Stoneware Laboratory Sinks are widely used in chemistry and bacteriological laboratories of *universities, schools, hospitals* and *industrial companies*. These sinks offer the following overwhelming advantages:

- (1) They are of one-piece construction, made without seams, slabs or interlocking joints and thus permanently leak-proof and trouble-proof.
- (2) The material is non-porous and non-absorbent; it does not become slimy, does not peel, flake, chip, stain or disintegrate.
- (3) These sinks can be kept clean very easily. With rounded inside corners, smooth salt glaze, they can always be kept immaculately clean.
- (4) Our body is of a uniform and homogeneous texture throughout and is stronger and tougher. Each sink is unconditionally guaranteed to give full and complete satisfaction in every respect and to be acid-proof, chemical-proof and corrosion-proof throughout the stoneware body, *with or without the salt glaze*.
- (5) The salt glaze on U. S. Standard Sinks will not crack or craze—a condition which invariably develops with porcelain or vitreous china.
- (6) These sinks are everlasting and permanent because they are incorrodible.
- (7) The cost is no greater than for other types of sinks which are obviously less desirable for laboratory service.

We are always glad to make up special sizes and styles. Write for Laboratory Bulletin No. 503 containing complete data, standard sizes, list prices, etc.

Acid-proof Chemical Stoneware Pipe and Fittings

The universal resistance of U. S. Standard Chemical Stoneware to acids, alkalis and chemicals makes it ideally suitable for any service involving the handling of corrosive solutions. This accounts for its wide use for waste and ventilating lines in *school, university, hospital* and *commercial laboratories*, and for acid drainage lines from photo-engraving, electroplating and industrial plants. U. S. Standard Chemical Stoneware Pipe is free from the limitations and weaknesses of lead, iron, brass, rubber, alloys, etc.

The cost is low, there is no hazard, no upkeep, no leaks, no repairs and the installation will outlast the building itself. U. S. Standard Chemical Stoneware is strong and tough and is unqualifiedly guaranteed to be acid-proof and chemical-proof throughout the entire body, with or without the salt glaze. The sockets and pipe ends are made with deep grooves to more firmly hold the packing.

Our line is complete in all sizes, including special and standard fittings, such as sanitary tees, TY's, "P" traps, running traps, troughs, sumps, etc.

Laboratory Bulletin No. 503 describing our entire line will be sent to you for the asking.

One piece
screw-over bon-
net, slip-on,
stay-on disc
holder

Bronze Valves with One-piece Screw-over Bonnet and Slip-on Stay-on Disc Holder

Strength is an outstanding characteristic of these Jenkins Standard Bronze Valves. The screw-over bonnet is made in one sturdy piece. Large hex faces provide easy and full purchase with a wrench. The bonnet can be easily removed and replaced repeatedly without becoming sprung or distorted.

Another advantage is the slip-on stay-on disc holder, an unusual feature made possible by the Jenkins one-piece screw-over bonnet design.

The disc can be changed in a moment. Before unscrewing the bonnet, just open the spindle a turn or two. There is no need to open the spindle all the way. The disc holder does not fall off the spindle while the bonnet is being removed from the valve body. It stays on the spindle until the spindle is turned in the opposite direction. Then the disc holder

slips off just as easily as it slips on.

These valves are made in globe, angle, cross, horizontal, check and angle check types.

Renewable Disc, Bronze and Iron Body Valves, Standard Pattern

Jenkins Valves, standard pattern, have the feature of renewable disc and disc-holder as shown in the sectional view of Fig. 106. The renewable disc, first introduced by JENKINS BROS. many years ago, assures absolute tightness. The flexibility of the Jenkins disc secures perfect seat contact and is a most important improvement in valve construction. For steam use, the discs are made of hard composition, which becomes pliable under the action of steam; for water, gas and air service, somewhat softer compounds are furnished.

If grit or scale lodges on the seat it does not seriously injure the valve body, but it becomes embedded in the composition disc, thus saving the valve seat. Discs worn out in service can be replaced easily at very little expense. All parts are standardized and perfectly interchangeable.

Radiator Valves

The wide range of Jenkins Radiator Valves assures the correct selection for each type of job.

They are furnished in the standard pattern as supplied for many years, or the new Low Bonnet Pattern. The line includes: Globe, Angle, Offset Globe and Corner Valves. The Corner Valves in regular straight or offset pattern, right or left hand. Regularly fitted with black composition hand wheels, but also can be furnished with bronze hand wheels, when required, or with lock shield and key.

Offset Globe, Male Union

Types of Low Bonnet Radiator Valves

In addition Jenkins Radiator Gate Valves are furnished when this type of valve is desired.

For hot water heating, valves may be had with a small hole drilled through diaphragm to permit slight circulation of water through radiator.

When so specified, valves are specially fitted for hot water heating systems *using forced circulation*.

Regular styles of finish follow:

Rough body, finished trimmings, No. 1 screwed, No. 6 with union

Finished and polished all over, No. 2 screwed, No. 7 with union
Rough body, nickelplated trimmings, No. 3 screwed, No. 8 with union

Rough body, nickelplated all over, No. 4 screwed, No. 9 with union

Finished and nickelplated all over, No. 5 screwed, No. 10 with union

Jenkins Improved Automatic Air Valves (Figs. 190 to 193) are used to remove air from radiators and heating coils automatically. All finished and nickelplated.

Regular sizes, $\frac{1}{8}$ and $\frac{1}{4}$ in.; also $\frac{3}{8}$ -in. size for long runs or large stacks.

Approved Fire Line Valves

Specially designed to meet the general demand for efficient, dependable hose valves and to fulfill the requirements of fire line service. Bronze, fitted with Jenkins composition disc. Large wheel enameled red.

Underwriters' Hose Gate Valve

Made in accordance with the Specifications of the National Board of Fire Underwriters, Associated Factory Mutual Fire Insurance Companies, and the National Fire Protection Association.

Hose end of valve is threaded with Eastern standard threads unless otherwise specified. Hand

wheel enameled bright red with the word "open" and an arrow cast on top of the rim.

Rapid Action Valves

For laundry wash wheels, and any service requiring frequent opening and closing of valves.

Opened wide by quarter pull of lever. Stays open automatically. Closes instantly without waterhammer.

Made of bronze with malleable iron lever.

Quick Opening Globe and Angle Valves

Valves have quadruple threaded spindle and bonnets, and can be opened full with about a quarter usual number of turns.

Bronze Globe, Angle and Check Valves for 250-lb. Working Steam Pressure

For many years the advantages afforded in the resiliency of the Jenkins composition disc have been well known, and this valuable feature is incorporated in this new line of

valves. The valves are fitted with a Jenkins disc, specially made to withstand working steam pressures up to 250 lb. The disc, being more resilient than the metal, readily conforms to the seat, and insures a tight valve without regrinding.

These valves are made in every respect to meet the higher pressure for which they are recommended and tested.

They can be furnished in globe, angle, and cross patterns; sizes from $\frac{1}{4}$ to 2 in.

Extra Heavy Bronze Valves

Globe, angle, cross, check and Y valves are designed for steam working pressures up to 300 lb., or 500-lb. water working pressures. Extra heavy iron body valves for pressure up to 250 lb.

FIG. 141

Standard Globe Screwed

Sizes, 2 to 12 in.

FIG. 370

Standard Bronze Gate with Inside Screw

or 300 lb. oil, water, gas; extra heavy for 250 lb. steam or 500 lb. oil, water, gas.

They are of the solid wedge, double face type. One of the important features of these valves is the improved globe shaped body. This new design is used because it secures the greatest possible strength, good proportion and neat appearance.

They are made with inside screw, stationary spindle; or with outside screw and yoke, rising spindle.

Iron Body Globe and Angle Valves

Jenkins Iron Body Globe and Angle Valves possess the strength to stand up in the most severe service. They are fitted with manganese bronze spindles and renewable bronze seat rings. The Jenkins Composition Disc, with which they are regularly provided, insures leak-tight seating under strains and stresses of maximum pressures, heat, weight and settling of piping, or frequent rough handling.

These valves are made in standard, medium and extra heavy pattern, with screwed or flanged ends. For pressures from 150 lb. working steam and 250 lb. working water to 350 lb. working steam and 400 lb. working water, according to the pattern. Sizes, from 2 to 12 in.

Jenkins Automatic Equalizing Stop and Check Valves

Are especially adapted to prevent boiler room accidents and to equalize the pressure between the different boilers in a battery.

This type is made in extra heavy globe or angle patterns with iron or cast steel bodies.

Gate Valves

Jenkins Gate Valves are made in bronze or iron body in three patterns: standard, for 125 lb. working steam pressure or 200 lb. oil, water, gas; medium, for 175 lb. steam

FIG. 325

Standard Iron Body Gate with Inside Screw

Iron Body Check Valves

All Jenkins Iron Body Check Valves in standard and extra heavy pattern are regularly fitted with a Jenkins Renewable Disc.

FIG. 629

Sectional View of Iron Body Swing Check Valve

Underwriters' pattern

FIG. 825

Iron Body Gate Valve

Underwriters' pattern

In Jenkins Swing Check Valves, the disc lifts well out of the passage. The hanger is heavy and has large bearing surface for carrying disc holder. The hanger pin is carried by a plug in each side of the body, making it always easy to remove.

Quality and Guarantee

Each Jenkins Valve is made for the maximum service, not merely for the average and is guaranteed when used in the service for which it is recommended.

Specification

"All valves shall be genuine Jenkins bearing the name 'Jenkins' within a Diamond mark."

For convenience, and to avoid possible mistakes, it is suggested that figure numbers also be specified.

Catalogue

A catalogue of all the Jenkins Valves, giving sizes, styles and list prices, mailed on request.

THE LITTLE GIANT MFG. CO.

Manufacturer of Sentinel Safety Sewer Valve

1401 3rd Avenue South, MINNEAPOLIS, MINN.

Product

SENTINEL SAFETY SEWER VALVES.

For Tu-bu-lur Radiator Brackets, Little Giant Radiator Hangers, Concrete Inserts and Temporary Radiator Legs, see Manufacturers' Index.

Sentinel Safety Sewer Valve

The Sentinel Safety Sewer Valve automatically prevents the backup of sewers through floor drains and fixtures. It closes immediately when backup occurs and opens as soon as water level recedes. This valve gives positive protection to property and merchandise and eliminates a dangerous health menace. It functions without human attention or electric current.

Sizes and Installation—Scale below shows the dimensions of the valve in sizes from 3 to 16 in. Valves are also made in 2-in. size and in larger sizes up to 24 in. The standard valve has hub ends but can be furnished with flanged or screw ends if specified. The standard model is built for upright installation in any specified position. On a single valve installation there is only one connection to be made to city water supply.

Operation—The valve is operated with city water connected to specially designed control valves on the hydraulic cylinder. The water supply is controlled by the cause of the trouble in the sewer. When the sewer pipe fills by reason of backup, the float in chamber (No. 1) rises to the top, causing the city water supply to be turned on at top of cylinder which forces the valve to close. When the water in sewer line recedes, the float drops, shutting water off at top of cylinder and turning on water beneath piston at bottom of cylinder (No. 2) which forces the valve to open.

Note—50 lbs. of water pressure creates approximately 1350 lbs. hydraulic pressure, assuring positive action. This force is sufficient to cut any ordinary substances such as paper, rags, and wood up to ½ in.

in thickness. Only metal or stones can prevent the valve from fully closing. The valve will operate on water pressure as low as 20 lbs.

The water remaining in the hydraulic cylinder when the pressure is reversed is discharged under hydraulic pressure through exhaust pipe (No. 3) through strainer (No. 4) and into the sewer pipe on sewer side of valve. This flushing action keeps the strainer clean at all times. The purpose of the strainer is to prevent any heavy substance from entering the float chamber.

The valve is constructed of the highest grades of materials: monel metal, bronze, brass, copper and cast iron being used in its construction. It meets the requirements of the best mechanical critics as well as all sanitary requirements and being a safety device, its manufacturers have spared no expense in constructing it perfectly.

Sentinel Safety Auxiliary Valves

Sentinel Safety Auxiliary Valves are used exclusively with the Sentinel Safety Sewer Valve and are placed on water supplies of any source or on additional sewers where more than one sewer serves the same building. These valves are cross-connected with the Master Valve (water supply, top and bottom) and function in unison with it. When the sewer backs up and the Master Sentinel Valve closes, the auxiliary valve closes with it. The water supply to the building is thus shut off in order to prevent the plumbing fixtures being used and the sewage water from flooding the basement through basement fixtures. When placed on sewer lines, the auxiliary will close and open in unison with the Master Valve. One Master Valve will control a series of auxiliary valves placed either on sewer lines or water supplies.

Electric switches, rheostats, and alarms can also be made to function with both the Master and Auxiliary Valve where it is desirable to shut off ice machinery or other equipment when sewers are not open.

These valves are installed in all classes of buildings—industrial, commercial and domestic.

Prices, details and recommendations will be furnished gladly on request.

AMERICAN REINFORCED CONCRETE SEPTIC TANKS.

DESIGN and INSTALLATION of Sewage Disposal Systems for residences, schools, factories, institutions.

ENGINEERING INVESTIGATIONS of Sewage Disposal, Factory Waste Treatment, Water Supply Projects and Land Drainage.

Special equipment and experience in handling installations for Boy Scout, private and labor camps.

TRADE-MARK

carefully considered before the system is planned. American systems are designed only after soil absorption tests have been made and results checked.

The usual method employed for secondary treatment is the absorption of the clarified sewage in the soil, either in tile fields, leaching trenches or wells. Where these methods are not possible or advisable, we provide the type of treatment best suited to the requirements. This may be such as open top or subsurface sand filter, disinfecting or other units.

Complete Sewage Disposal Systems

All installations have as their ultimate object the complete disposal of sewage waste in an efficient and sanitary manner. The method used depends entirely upon local conditions, but in general, the system will consist of a settling tank, followed by a soil absorption area.

Septic Tanks

The main function of the septic tank is to relieve the sewage of the solids, which will either settle or float, so that the liquid from the tank can be more easily discharged into the soil or secondary unit.

For small residence work, the precast American tank may be successfully used.

For larger installations we design the type of tank best suited to the requirements.

Whether precast, or built-in-place, American tanks are made of watertight reinforced concrete. Proper facilities are always provided to permit easy cleaning of tanks.

Secondary Treatment

The most important part of any sewage disposal system is that of secondary treatment. This should be

Standard Materials Used

This company is not committed to any particular system, apparatus or device, but provides whatever will meet the requirements of the problem practically and economically. It avoids, in so far as possible, the use of so called "specials," designing systems with such standard materials as are commonly employed and which can be purchased economically on the open market.

Capacities of Systems

Septic tanks for residence work should provide a capacity of not less than 60 gallons per person, plus proper allowance for guests. Tank capacities for schools, institutions, etc. vary with the use of the particular building. We shall be glad to furnish detailed information on such tanks upon request.

The capacities of secondary treatment units depend entirely on soil conditions. The type and size of these units can be correctly determined only after a careful study of these conditions.

Tide Water Oil Company—Base Plants in Connecticut, New York, New Jersey, Virginia and Rhode Island

ATEN SEWAGE DISPOSAL CO., INC.

TELEPHONE CONNECTION

286 Fifth Avenue
NEW YORK, N. Y.

Products and Service

The ATEN SEWAGE DISPOSAL CO., INC., designs and furnishes sewage disposal systems for residences, clubs, schools, hotels, hospitals, factories or other institutions not connected with city sewers. We contract for the complete installation of our systems, or we can furnish necessary parts (septic tank fittings, metal forms for crowned roofs and reinforced wire forms for concrete work, cast iron manhole collars and covers, siphons, diverting gates, special "Y" branches for tile lines, and special horse-shoe tile) for installation by common labor.

Upon receipt of the necessary information, we will gladly prepare the necessary drawings and specifications for the proper type of system to meet present and future conditions in the most economical and satisfactory manner, and furnish an estimate for either complete installation or special materials.

Guarantee

When installed by us, or in conformity with our directions, we guarantee the successful operation of our systems to dispose of domestic sewage from the buildings served.

Principles of Sewage Disposal

For systems adapted to individual buildings or groups of buildings the greatest efficiency is attained by settling and digesting the solids in septic tanks and disposing of the sewage effluent from these tanks by filtration through the ground by means of percolation tile drains, leaching chambers or filter beds.

Aten Sewage Disposal Systems

The system consists essentially of a septic tank and filtration fields or leaching chambers. A diverting gate, siphon, special fittings and special tile are features promoting automatic and efficient operation.

Septic Tank—The Aten septic tank consists of an airtight reinforced concrete chamber which receives the sewage, and settles and digests the solids by bacterial action. No chemicals are used.

After many years of experience and experimenting, we designed a reinforced wire form by means of which a concrete tank can be poured in position without the use of wooden forms.

The Aten wire form is embedded and remains in the concrete, thus reinforcing it. This form saves about half the cost of concrete because thinner walls are used; it saves the cost of wooden forms and the time of a carpenter to erect and to take them down.

Filtration Field—Consists of at least two sets of tile lines, especially designed to allow air to reach the sewage and permit uniform seepage to the soil. A diverting gate permits one set of lines to "rest" while the other is in operation.

Leaching Chambers—Used where land is not available for tile fields. Two or more are used for each septic tank so that one chamber may "rest" while the other is in operation. Constructed of stone, brick, or hollow building block.

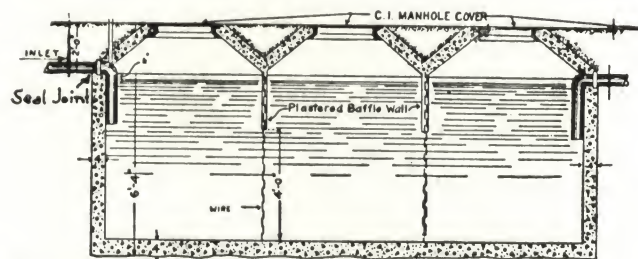

TRADE-MARK

Sectional View of Aten Concrete Septic Tanks in Multiple

Aten single septic tanks can be furnished with capacities from 550 to 2500 gal. For schools, camps, clubs and factories where greater capacities are required septic tanks are installed in multiple, as shown above

THE ATEN SYSTEMS Type "A"

Type A System is designed for installation in ground having at least a 5% slope, and top soil of a sandy or porous nature. The slope permits the use of an automatic siphon which periodically flushes the septic tank effluent through the filtration tile fields. The diverting gate permits alternation of the fields. Special Y branches secure even distribution of the sewage effluent to each of the laterals of the tile lines.

Type "B"

Type B Design is adapted to ground having a very flat grade. A modification of Type A, omitting the siphon. A feature of this design is that it permits laying the tile lines nearer to the surface of the ground, which is desirable for soils of slow seepage rate. Diverting gate and special Y branches are used, as in Type A.

Type "C"

Type C System is used where sufficient land is not available for the fields, or where the subsoil is more porous than the top soil. The siphon is omitted, and two or more leaching chambers are substituted for the tile fields. For school buildings where more than two leaching chambers are required, they are installed in series, controlled by a diverting gate. In this manner one series is in operation while the other series is drying out. Chambers are built of concrete building blocks.

tical and the horizontal. By a system of internal baffles which are found only in these tanks, a clearer effluent is produced which consequently results in a more speedy ab-

sorption of it.

The tables at bottom of first column show the various sizes and capacities of the Kaustine Super-Septic Tank. This tank is covered by a U. S. Government patent.

Services

Engineering staff; local field men. The KAUSTINE COMPANY, INC., has an engineering department at the main office devoting its attention wholly to sanitary engineering work. In conjunction with this head office and co-operating with it are local offices manned by graduate engineers or men especially trained for the work. This service, together with a product of widely known quality, relieves architects of all sewage disposal details. Write for Architects' Data Sheets.

Design

KAUSTINE COMPANY, INC. are the originators of the metal septic tank and, as such, have kept in the forefront of the design of septic tanks for sewage disposal purposes. Improvements to the tanks in accordance with the best methods of sewage disposal are constantly being made, thus keeping the Kaustine Septic Tanks in the front rank of this class of equipment.

Kaustine Super-Septic Tanks

The Kaustine Super-Septic Tanks stand among those at the head of the line of sewage treatment tanks for rural and suburban installations and are made in two styles: the ver-

Materials

Kaustine Super-Septic Tanks and Kaustine Armco Iron Septic Tanks and the Chemical Toilet and Septic Toilet Tanks are made exclusively of *Armco Ingot Iron* protected by a heavy coating of black plastic enamel inside and outside. As far as materials and workmanship are concerned there is only one grade of Kaustine quality products.

Kaustine Armco Ingot Iron Septic Tanks

Ofttimes price is a determining factor in the purchase of a septic tank. In that case, the Kaustine Armco Ingot Iron Septic Tank is recommended. It too, is built of *Armco Ingot Iron* coated with black plastic enamel, but does not have the baffle which is a feature of the Super-Septic Tank. These tanks are made in two styles: the vertical tanks of 200 and 320-gal. capacities and the horizontal tanks of 200 to 5000-gal. capacities.

Kaustine System Toilets

Frequently in rural homes an indoor toilet is desired but running water under pressure is not available. For these conditions either a Kaustine System Toilet, chemical type, or a Kaustine System Toilet, septic type, is recommended. In the former sewage is held in a tight tank in which there is a solution of Kaustine Chemical which sterilizes the sewage and, together with the specially designed system of rotary agitation, breaks down the solids, rendering them liquid and easily disposed of. In the latter, sewage is discharged into a metal tank provided with an overflow where, without the use of chemical under a natural, biological process, the sewage is digested. Liquid flowing out of the overflow is disposed of by means of tile lines laid with open joints in the ground adjacent to the installation.

Kaustine Chemical

Guaranteed to be of standard purity and strength, being many times stronger than phenol (carbolic acid). It is an odorless crystalline compound and renders sewage harmless and free from odor by destroying all organic matter and bacilli. It can also be used as a resolvent in the case of clogged drains and clogged cesspools.

NATIONAL SANITARY ENGINEERING CO.

Engineers and Contractors for Sewage Disposal and Water Supply Systems

BETHEL, CONN.

NEW YORK OFFICE, 101 Park Avenue

Products and Services

COMPLETE SEWAGE DISPOSAL and WATER SUPPLY SYSTEMS installed for residences, schools, clubs, institutions, camps or communities.

Also Septic Tanks, Water and Sewage Pumps, Sewer Pipe, Drain Tile, Siphons, Diverting Gates and Miscellaneous Water Supply and Sewage Disposal Equipment.

Engineering Reports submitted.

Ultimate Disposal of Sewage

Sewage may be ultimately disposed of in only two ways:

(1) Discharge into a watercourse.

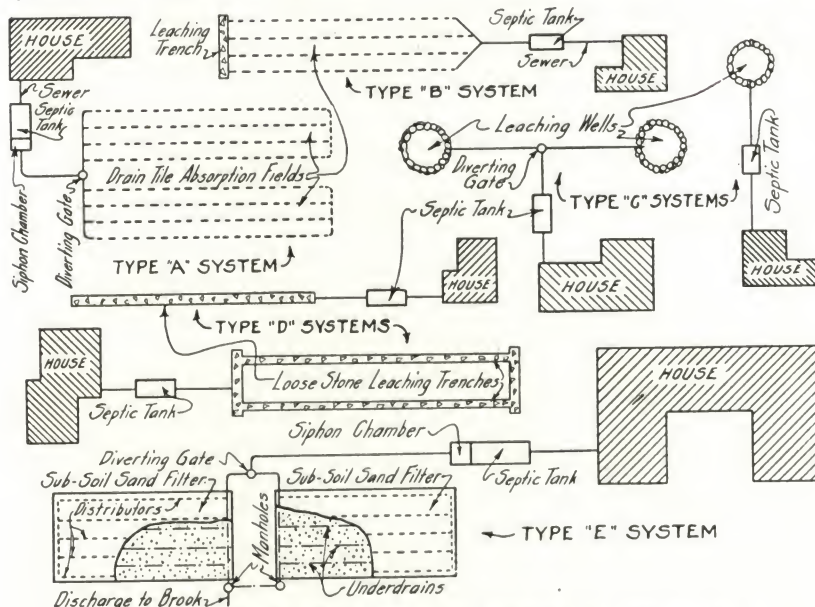

(2) Absorption by the soil.

Where large quantities are to be disposed of, particularly from cities, the usual method of ultimate disposal is by discharge into a watercourse. Various constituents in the sewage, however, must first be removed by treatment plants in accordance with State, local or other governmental regulations.

For buildings not served by city sewers, the general method is to construct individual systems which will permit the liquid to be absorbed by the soil.

Layouts of Systems

Treatment plants for removing sewage constituents prior to discharge into a watercourse are of many types and forms of construction and require skilled

Typical Layouts of Sewage Disposal Systems for Residences

engineering investigation for proper layout and design.

Systems for absorption of the liquid by the soil should include two main units:

(1) A settling tank, usually of the septic tank type, for removing soil clogging solids from the sewage.

(2) Soil absorption units for permitting the settled sewage to seep away through the soil.

St. Thomas Seminary, Bloomfield, Conn.

LOUIS A. WALSH, Architect, Waterbury, Conn.

Sewage disposal system consisting of Imhoff tank, siphon chamber, glass covered sludge bed and sand filters, capable of treating over 30,000 gals. per day.

Designed and constructed by NATIONAL SANITARY ENGINEERING CO.

Where a watertight soil is encountered, soil absorption systems cannot be successfully used and the wastes must pass through a proper treatment plant and be discharged into a watercourse.

Specifications and Cost Estimates

Upon obtaining pertinent data, we will furnish, without obligation, specifications and quotations for complete installation of sewage disposal and water supply systems. The general layout and size of the various units comprising the system will be included in the specifications.

Engineering Services

In addition to preparing plans and specifications, our Engineering Department will, when properly authorized, act for our clients in securing necessary approval of plans from State or local health departments or other authorities having jurisdiction.

Our Engineering Department is also available for special reports on water and sewage treatment projects, particularly for the larger institutions and communities.

References and Installations

References and a list of our installations will be gladly sent upon request.

Organization and Material

Quality and service since 1886.

Our installation departments include graduates of colleges, and former officers of the U. S. Army for the engineering and sales work.

For installation of the systems, we maintain permanent crews of men operating from our nearest office.

The tanks we use are made in our own factories or built on the property.

Our precast septic tanks are made of carefully prepared and seasoned concrete—giving a composite stone that we guarantee for a lifetime.

Types of Septic Tanks

In addition to our precast concrete tank, we build concrete tanks on the job, also brick tanks, as shown on the plate of details opposite.

Features

Where separate line is not provided for kitchen waste, we include a grease trap arrangement with our system for the purpose of trapping the grease, so that it can be easily removed at proper intervals.

Cast iron manhole covers (one or more) are provided for all installations we make.

The design of our tank permits us to bring this manhole cover close to the surface of the ground (with extra sections) no matter what the depth of the soil line may be.

Modern drainage methods are used for seepage.

The cost of our system installed is exceptionally low. Every detail of the work—from manufacture of the article, to the covering over of the finished job—comes under our own supervision, thus eliminating unnecessary overhead and other expenses.

Service

An engineer will inspect and report and will make recommendations, on request, without obligation. Plans and specifications will be submitted, if desired.

We keep in constant touch with the users of our systems, advising them when to remove grease, or do it for them at a nominal cost.

Brief Description of Systems and Their Installation

Attention is invited to the fact that this company has originated the grease trap arrangement—considered as very essential even though traps may be placed beneath sinks.

We have also originated the sectional arrangement to bring the manhole covers to any height desired, irrespective of the depth of the soil line.

Special type of drain tile has also been introduced by us, insuring seepage over every square inch of the trenches.

Sewer Line—This is usually vitrified tile pipe. Cast iron pipe is used where the pipe line is likely to get rough contact (as under driveways).

Precast Septic Tank—The size of the tank is judged according to standard specifications. The sewage enters the grease trap sections first, where it is detained long enough to permit the rising of the grease to the surface, and its retention in that section—most of the natural sewage in solution then being passed on to the second section.

The second section retains the liquefied sewage, passing on the water effluent to the third section, and from there it is carried off for amœbic bacterial treatment—and seepage—in the trenches.

Siphon—For the purpose of discharging the water effluent into the drainage field to obtain more far-reaching drainage, and also rest periods for the trenches between discharges.

Contour conditions, ground water and available space are the opposite factors to consider. Where these objectionable conditions do not exist, the siphon is advisable.

Disposal Field—Standard size and "fill" for trenches are used by us. Special type of tile is used to obtain the best drainage possible. Check basins (serving also as dry wells) are installed where considerable trench is used.

Distribution chambers are used—instead of branch pipe lines—in order to get more perfect distribution to the branch lines.

Capacity Required—For schools, with showers, 30 gal. per capita per day.

For factories, without showers, 35 gal. per capita per day.

For hospitals, hotels and similar institutions, 100 gal. per capita per day.

Based on a 12-hour retention period, the tank capacity would be equal to one-half the above figures, per capita per day.

For ordinary size home, 100 gal. per person per day. Other requirements estimated on request.

NUSTONE SEPTIC TANKS AND SEWAGE DISPOSAL SYSTEMS

THE NEW YORK SEWAGE DISPOSAL CO.

Experts in Sanitary Engineering

5621 Grand Central Terminal
NEW YORK, N. Y.

Products and Services

Experts in the DESIGN and CONSTRUCTION of SEWAGE DISPOSAL, WATER SUPPLY and kindred SUB-URBAN UTILITIES.

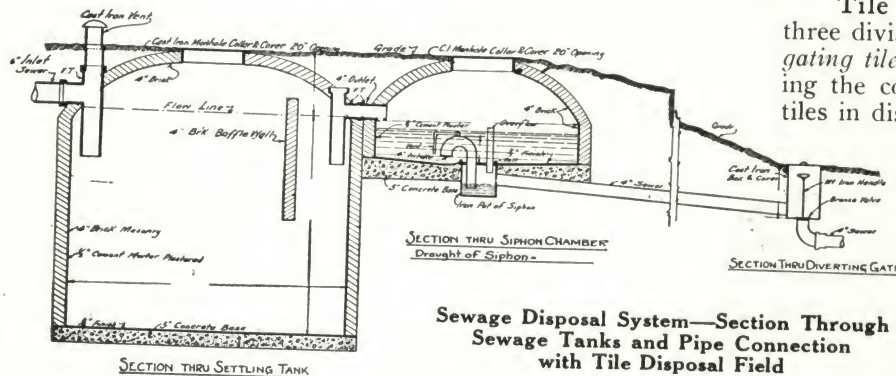

The engineering staff is made up of graduates of the best technical schools who are trained by years of experience in sanitary and mechanical engineering in the fullest meaning of the terms. They will investigate and report on Sewerage, Drainage, Water Supply, Pumps, Swimming Pools and kindred subjects.

Experience

Over twenty-five years' active work in design and construction.

Plans and work are approved by State, county and city health officers and engineers.

The scope of the work of this company extends from the smallest plants for dwellings to hospitals, golf clubs and institutions.

Sewage Disposal System—Section Through
Sewage Tanks and Pipe Connection
with Tile Disposal Field

Description of Residential and Institutional Sewage Disposal Plants

This company is the originator and developer of an automatic siphon which works properly; a diverting gate that does not rust or jam, and a type of sewage irrigation tile.

Sewer—Vitrified or iron pipe; standard engineering specifications.

Settling Tank—A tight masonry structure provided with special inlet and outlet devices, baffle and weir walls and other arrangements.

The particular design which may be selected depends upon the nature and volume of sewage to be treated.

Siphon Chamber—A masonry structure built in connection with settling tank. Receives liquid overflow and by means of an automatic siphon, discharges this effluent at periods. The siphon chamber produces periodic discharges filling uniformly the tile disposal field beyond, permitting a period of rest.

Tile Disposal Field—Made up of two or three divisions, or fields, of *special sewage irrigating tiles*, laid in a series of trenches following the contours. The quantity of absorption tiles in disposal fields is determined by a study of the ground, and amount and nature of sewage to be treated.

Special Diverting Gate—Provided so that siphon discharge may be deflected into either of the fields.

Special Terra Cotta Fittings—Designed to set along the distribution lines, permitting a uniform flow.

R. D. SIMPSON COMPANY

Sewage Disposal Equipment

136 East Gay Street
COLUMBUS, OHIO

Products

SEWAGE DISPOSAL EQUIPMENT: SIMPSON PNEUMATIC TIPPING TROUGHS and SIMPSON EQUIDOSE DISTRIBUTORS.

Centralized School House or Country Club, Institution or Industry Lath Filter Plant Design

A lath filter plant includes a settling tank, one or more lath filters and a secondary settling tank. Under gravity operation ordinarily, the raw sewage flows successively through the settling tank and an inspection or surge chamber, thence through 2-in. galvanized steel pipe located on the longitudinal center line of the lath unit into one end of a tipping trough. The liquid is distributed over the top of the laths by Simpson Equidose Distributors, which are suspended a short distance above the laths and are alternately flooded. The trough is supported between the two units of the filter and does not rest on the lath.

Catalogue covering details of equipment and lath filter plant design sent on request.

Simpson Pneumatic Tipping Trough

For trickling filter influent distribution.

Especially adapted to the application of trickling filters to the treatment of sewage.

Intermittent controlled flooding—approximately uniform distribution on filtering material.

Small loss of head—siphons and dosing tanks eliminated; non-clogging operation; very limited attention required; unaffected by freezing.

Especially adapted for replacement of wornout wooden tipping troughs.

Maximum practical flooded area, 12-ft. trough, 120 sq. ft.; capacity per tip, 0.37 gal. per lin. ft. of trough.

Made in lengths up to 15 ft.

Simpson Equidose Distributors

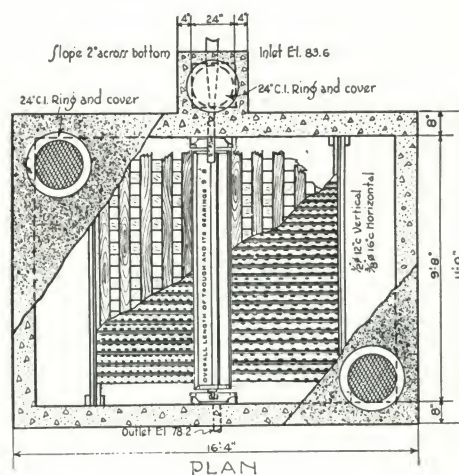

These distributors are made of 16 in. gauge steel—channel shapes and are perforated with many half-inch holes affording uniform distribution and also practically eliminating suspended matter deposition with resultant clogging.

They assure the longest, most economical and satisfactory service because they resist rot, heat, atmospheric conditions, moisture, etc. Rigid, non-warping, and will not sag.

Arrangement of a 4-foot Simpson Automatic Tip- ping Trough and Distributors

Complete Sewage Disposal Systems

San-Equip now offers a complete septic system that provides safe sewage disposal for suburban and rural homes, camps, schools, or factories. The San-Equip Septic, proven dependable by thousands of satisfactory installations, is combined with either of two new drainage units—San-Equip Filter Pipe or Drain Pool to provide a completely

San-Equip

unified and more efficient service.

Every San-Equip installation is "certified"—a definite assurance of adequate and dependable disposal. A Certificate of Approved Equipment, posted in the building, serves as a permanent record of the installation.

Our factory representatives listed above will be glad to assist you with your particular requirements.

Installation Plan No. 1—Septic Tank and Filter Pipe

Installation Plan No. 2—Septic Tank and Drain Pool

The Septic Tank Unit

This is the septic tank that has been approved by health authorities as standard equipment for homes beyond the sewer lines. Its patented, two-chamber design assures complete treatment of sewage. Thousands of satisfactory installations have proven San-Equip durability.

Design—Follows U. S. Public Health Service recommendations. Construction is featured by liberal baffles, reinforcement around top of tank, set-in collars with stop lugs, and a full partition that divides the tank into two distinct chambers.

Material—Copper-bearing iron, rustproofed against moisture, acids and soil by a heavy mineral asphalt coating. 20% to 30% heavier.

CAPACITIES AND DIMENSIONS, SAN-EQUIP SEPTIC TANKS

950	5000	250	410	340	69" x 29' 2"	5100	800

Vertical Type Tanks for the Small Installation—San-Equip Septics Nos. 402 and 403, 200 and 300-gallon capacities respectively, are upright tanks as shown above. These sizes are most commonly used for the average small home, or camp.

The Siphon Septic Tank Unit

This San-Equip Tank embodies the outstanding improvement in septic design—the combination of siphon discharge with septic process in one compact unit. Every architect will recognize its operating advantages.

The siphon discharges at 4 to 8-hour intervals in such volume as to send the effluent to every part of the filter field. This provides equal distribution of the drainage load—keeps the entire tile field active, reduces the possibility of overloading or clogging. Intervals of rest, between discharge periods, allow the drainage field to better absorb the treated sewage for final disposal.

Design—Approved by leading health authorities. Siphon unit completely assembled in tank. Easily handled and installed. All systems are horizontal type as shown. No. 725 up have three manholes. Liberal baffles, set-in collars with stop lug, and full partition making two distinct chambers. All outlet openings are 4-in. diameter. Intake openings as specified. Siphon chamber capacity may be changed if desired.

Material—Special, rust resisting, copper-bearing iron, rustproofed inside and out with mineral asphalt.

750	3750	700	250	410	340	69"x29' 2"	5225	840

The Drainage Unit

Complete Disposal Depends on Adequate Drainage—Complete septic sewage disposal depends as much upon efficient drainage as upon septic action within the tank itself. It is most important, therefore, that adequate drainage equipment be installed to assure correct operation of the tank as well as a constant trouble-free service. Either the Filter Pipe or Drain Pool listed below will provide maximum drainage efficiency.

San-Equip Filter Pipe—An improved, unbreakable pipe designed primarily to provide greater filter field efficiency. Special perforations along the pipe increase the drainage area 12 to 20 times per foot. Consequently, less pipe is necessary with a proportionate saving in installation cost.

All-metal in construction, this new pipe lays easier and eliminates costly breakage in handling. Tight joints maintain alignment and prevent seepage of dirt into the line. Made of 16 gage copper-bearing iron, rustproofed with mineral asphalt.

For 24-hour service, use 12 to 15 ft. of San-Equip Pipe per person in porous soil. In tight soil increase capacity up to 20 ft. per person. Information gladly furnished for school or other part time service.

Ideal depth of septic tank and filter bed is 12 to 18 in. underground. Grade line to tank at least 1/4 in. to 1 ft. Grade line from tank 1 in. to 10 ft. with branches spaced 6 ft. apart.

San-Equip Filter Pipe is packed in cartons for convenient shipping and handling.

No. 420	Carton of 10 2-ft. lengths of 4-in. pipe.....	\$5.00
No. 425	Carton of 2 2-ft. lengths unperforated pipe and 4 single Y fittings 4x24 in.....	5.00
No. 445	45° angle fitting 4x12x12 in., each.....	.50

San-Equip Drain Pool—A scientifically designed seepage pool for use where septic drainage area is limited and where there is no danger of water supply pollution. It is easier to install this San-Equip Pool than to build the ordinary type. Saves labor and materials.

The drain pool—shipped in two sections—is assembled as shown above. This makes an open bottom pool 19 in. deep, 38 in. wide, 96 in. long, providing 25 sq. ft. of soil drainage. In average soil this is sufficient to serve 200 or 300-gal. septic tanks. For larger systems, a number of San-Equip Drain Pools may be connected to provide ample drainage in a limited space. Pools should be spaced 15 ft. apart.

No. 240 DP is the complete Drain Pool. Made of 14-ga. copper-bearing iron—completely rustproofed by mineral asphalt. Shipped in two sections—nested.

No. 240 DP	240-gal. capacity	Weight 180 lb.	\$20.00
------------	-------------------	----------------	---------

San-Equip Grease Trap—For use with the septic system wherever there is a large amount of grease and kitchen waste. Requires occasional skimming.

Made of rustproofed copper-bearing iron. Standard openings 2 in., threaded couplings. Openings for 4-in. soil pipe if specified.

No. GT 40	40-gal. capacity	22 1/2 x 24 in.	\$15.00
No. GT 60	60-gal. capacity	22 1/2 x 36 in.	18.00

STANDARD CEMENT CONSTRUCTION CO.

INCORPORATED

Manufacturers of "Standard" Septic Sewage Disposal Devices

EXECUTIVE OFFICES

Heyburn Building, LOUISVILLE, KY.

ADVISORY ENGINEER FOR THE NORTHERN DISTRICT, G. A. P. BOWMAN, BEAVER, PA.

Products

"STANDARD" SEPTIC SEWAGE DISPOSAL SYSTEMS.

"STANDARD" SEPTIC WATERSEAL TOILETS.

"Standard" Septic Sewage Disposal Systems

A perfect adaptation of the L.R.S. System originated by United States Government engineers.

It is not only a most advanced but also a most economical system designed for suburban homes, factories, public buildings, schools, country clubs, etc. The first cost is low, the maintenance is practically nil and the installation is permanent.

Operation—Proper and extremely active bacterial action and sanitary disposal of the sewage is accomplished effectively and thoroughly through the peculiar construction of the patented "Standard" Tank. Used with care, it is rarely necessary to remove cemented covers from a "Standard" Tank. The practically clear liquid that leaves the tank may be taken care of by soil irrigation, leaching bed, dry well or emptied into storm sewer—the method used being governed by local conditions.

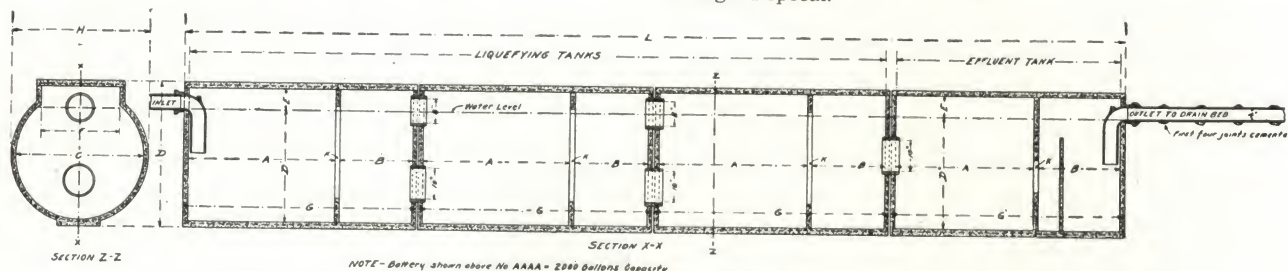

"Standard" Septic Tank

Construction—The tanks are cast of especially prepared concrete, reinforced with steel rods and binding, which construction improves with age. They are thoroughly waterproofed inside and out, making leakage and ground absorption impossible; easily installed—installation being only a matter of leveling up; simple instructions are furnished or we will install plant complete.

Sizes—Sizes to accommodate any number of people. The larger units are so constructed as to permit coupling two or more together—this is known as the "Standard" Septic Battery.

Complete Villages and Smaller Cities Use "Standard" Systems

In addition to the tens of thousands of private installations throughout the country, thousands of "Standard" Systems are now in use by complete villages and small communities who need never worry about the dreaded epidemics so prevalent in unsanitary communities.

"Standard" Septic Batteries make a very practical plant as additional units may be added as the requirements increase, without disturbing the initial installation. Distributing chambers are furnished with batteries of more than four units, also "Standard" sewage siphons, when conditions demand same.

"Standard" Septic Batteries make a very practical plant as additional units may be added as the requirements increase, without disturbing the initial installation. Distributing chambers are furnished with batteries of more than four units, also "Standard" sewage siphons, when conditions demand same.

"Standard" Waterseal Toilets

This Waterseal is used where running water is not available, although it can be easily converted into a running water system at any time.

It is very popular with industrial plants, coal collieries, mill and mine villages.

The outfit consists of regular "Standard" Septic Tank, over the large compartment of which is placed a specially designed straight back hopper or commode as shown in the drawing below.

Exclusive with "Standard" outfits is this device which effectively seals the contents of the tank, eliminating odors and making it absolutely sanitary without chemical or maintenance expense.

The Waterseal makes use of a sliding sleeve and drop pipe connection which extends below the water line. All solids pass through it and are completely immersed. It eliminates exposure of the mat of solids to light and air. The Waterseal telescoping pipe also overcomes any inequalities of the ground wherever the installation is made.

More Than Fifty Factories to Serve You

Our central location and more than fifty branch manufacturing plants, combined with our policy of intense application and standardization, enables us to make a very attractive price on "Standard" equipment; either delivered, or delivered and installed.

Engineering and Installation Service

We specialize in sanitation and solicit your inquiries regarding sewage disposal. No contract too large, no installation so small but what the most careful attention is given to it by our engineers.

Detail construction drawings and literature gladly furnished on request.

Profit by our sixteen years' experience and research in sewage disposal.

TRADE-MARK

building started, it is found almost impossible to properly install the sewage disposal equipment.

In other words, sewage disposal should be a *primary consideration* and not a secondary one. You can save labor, time, and money by consulting us when planning your project.

We furnish detailed plans and specifications of the sewage disposal plant to the architect and engineer. We also furnish the services of an engineer to supervise installation work.

We manufacture, design and install sewage disposal systems for estates, country clubs, schools, camps, and all other types of institutions.

Many Users—Over 70,000 tanks of this design are now in use.

Sep-Tank Sewage Disposal Systems

Sep-Tank

The Sep-Tank sewage disposal system consists of one or more Sep-Tanks and necessary drain tile and employs the L.R.S. system of sewage disposal devised by the United States Public Health Service. Sep-Tanks have been commended by various State boards of health and other eminent authorities on sanitation.

Sep-Tanks—Sep-Tanks are permanent, made of concrete, thoroughly reinforced by steel fabric to prevent cracking, and waterproofed to prevent leaking and absorption. The best grades of portland cement, selected silica sand and special steel reinforcing are used.

Sep-Tanks are cylindrical in shape and the sides and bottoms are moulded in one piece. With no joints to open after installation, leakage is prevented and sufficient water in the tank is assured at all times to promote septic action. Covers are also made of reinforced concrete, moulded separately and waterproofed. The corrosive action of the acids in the sewage will not affect Sep-Tanks.

Operation—The Sep-Tank has sufficient depth to insure complete digestion of sewage and sufficient area for a proper bacterial mat. Flow of sewage through the Sep-Tank is retarded by curved pipes or baffles, preventing agitation.

Important Information and Engineering Service for Architects and Engineers—When you start plans for a home, school, factory, or any type of building which is to be built in an *unsewered location*, and you desire to use modern sewage disposal equipment, please consult our engineers in regard to recommendation for proper installation of septic tank equipment. Very often after plans and specifications are made and

SINGLE UNIT SEP-TANK SYSTEMS FOR SMALL SINGLE HOUSES

Sep-Tank No.	Size, in.	Capacity, gal.	Number of persons served, etc.	Approx. weight, lb.
20	32x54	200	5 persons; 1 bath	1450
21	38x54	250	7 persons; 1 bath	1600
22	44x54	300	10 persons; 1 bath	1750

*BATTERY SYSTEMS

Battery No.	Number and size of liquefying tank, in.	Number and size of effluent tank, in.	Total cap., gal.	Number of persons served			Approx. weight, lb.
				Residences	Factories	Schools	
12	1-44x52	1-28x42	450	15	30	45	2600
12-S	2-44x52	600	22	35	52	3900
13	2-44x52	1-44x52	900	30	45	60	4650

18	7-44x52	1-44x52	2400	125	175	225	11350

*For large installations to accommodate large residences, schools, hotels, factories, etc., where the single units are too small to take care of the sewage. The seven batteries listed above are carried in stock, but we can arrange tanks in batteries up to any number required. We manufacture battery systems with each tank having a capacity of 400 or 1000 gal. The above listed battery units are of 300-gal. capacity each.

Grease Traps of Reinforced Concrete

On all the larger buildings the use of a grease trap with the septic tank system is essential. Kitchen, pantry and laundry wastes should discharge directly into the grease trap before discharging into the septic tank system. Grease clogs sewer lines and hinders the operation of the septic tank system, as it is not subject to liquefaction by bacterial action. Several different sizes of grease traps are available, as follows:

No.	Cap., gal.	Outside, in.		Inlet to bottom, ft. in.	Weight, lb.
		Diam.	Height

Battery Set No. 16

AMERICAN FOUNDRY & MFG. CO.

Manufacturers of Seep-proof Floor and Roof Drains, Traps and Swimming Pool Equipment

OFFICE AND FACTORY

Eleventh and Hebert Streets, ST. LOUIS, MO.

Products

SEEP-PROOF FLOOR DRAINS, with and without Traps and Inside Strainers, for cement, tile or other composition floors, shower and urinal stall receptors.

SEEP-PROOF PROMENADE DRAINS.

SEEP-PROOF ROOF DRAINS.

EXPANSION JOINT CONNECTION.

SWIMMING POOL FITTINGS.

Also manufacture all types of Plumbing, Water, Gas and Hardware Specialties, as, Hydrants, Bubble Fountains, Sinks, Grease Traps, Cesspools, Closet Tanks, Grates, Service Boxes, Steam Traps, Valves, etc.

Materials

Cast iron, brass. Adjustable brass heads with removable strainer regularly furnished nickelplated, brass tops regularly furnished polished, unless otherwise specified. Strainer heads chromium plated or white metal at extra cost. Made also in galvanized cast iron or all-brass at extra cost.

Seep-proof Drains and Traps

In the development of these SEEP-PROOF Drains, the method of installation and the principles of sanitation were given careful consideration. Two distinct styles that will fulfill the most exacting requirements are offered.

First Type—The first type is recommended for cement, tile or any composition floor. The surfaces of the drain pan and strainer body are scoriated, the drain body is plain cast iron. This combination, together with the annular groove in the drain pan, when embedded in concrete will make one homogeneous mass, consequently the surrounding material will not contract from the drain, thus eliminating the possibility of seepage.

Second Type—The second type has an adjustable brass flashing connection and is recommended for use with concrete and lead pan work. The surface of the drain pan is flat and affords the proper support to connect the flashing.

Clamping Device—The adjustable brass flashing connection screws down and clamps flashing to the surface of the drain and in addition it has a finished bevel edge, for tinning, to make a solder joint. It is also removable so that the lead pan can be put into place and hole cut out to exact size of threaded opening in drain body.

Seepage Passages—Drains with seepage passages, although we do not recommend this arrangement, can be furnished without additional cost but should be so specified when wanted.

Types of Drains

No. 30 Floor Drain with-out Trap—Cast iron body and adjustable brass head with removable strainer. Threaded outlet, female iron pipe. Made also in galvanized cast iron body or all brass at extra cost.

No. 38

No. 38 Floor Drain and Trap without Seal—Cast iron body and adjustable brass head with removable strainer. Threaded outlet, female iron pipe. Made also in galvanized cast iron body or all brass at extra cost.

Literature

Catalogue S31 mailed upon request.

No. 105

With or without cast iron inside strainer

No. 107

With or without cast iron inside strainer

No. 101

No. 103

No. 110

No. 105 Cast Iron Floor Drain—Especially adapted for concrete or tile floor installation where a large area is to be drained. Has an extra heavy cast iron grate. Threaded outlet, female iron pipe. No. 105 has no inside strainer. No. 105B is with inside strainer. Made also in galvanized cast iron or with brass top and hinged brass strainer at extra cost.

No. 107 Cast Iron Floor Drain—This is a larger and heavier construction than No. 105. Threaded outlet, female iron pipe. No. 107 has the inside strainer. No. 107C is without. Made also in galvanized cast iron or with brass top and hinged brass strainer at extra cost.

No. 101 Cast Iron Roof Drain—For concrete roofs, constructed with tar and gravel, tile or composition roofing felts. Threaded outlet, female iron pipe.

The combination retainer ring holds the roofing felts in place against the inside of the drain body, making a permanent joint and eliminating the use of flashing.

Area of inlet openings in dome strainer is more than 150 per cent that of the outlet in drain.

Made also in galvanized cast iron or all brass at extra cost.

No. 103 Cast Iron Roof Drain—For wood roofs, constructed with tar and gravel or composition roofing felts. Threaded outlet, female iron pipe.

The combination retainer ring holds the roofing felts in place against the inside of the drain body, making a permanent

joint and eliminating the use of flashing.

Area of inlet openings in dome strainer is more than 150 per cent that of the outlet in drain.

Made also in galvanized cast iron or all brass at extra cost.

Nos. 101CD and 103WD Cast Iron Promenade Drains—SEEP-PROOF Roof Drain Bodies No. 101 and No. 103 equipped with extension sections having a square top and round flat grate, for use on promenade decks. Threaded outlet, female iron pipe. Made also in galvanized cast iron or cast iron body with cast brass polished top section and strainer at extra cost.

Always state the dimensions (H) top of grate to surface of waterproofing and size of tile if any for dimension (J) as these extension sections can be made to suit any requirement. Otherwise drains will be furnished with standard dimensions as shown in tables.

No. 101 Expansion Joint Connection—The expansion joint is made up in combination with either wrought iron or brass pipe and connection can be made direct to the drain or anywhere in the line.

Wrought pipe or brass pipe nipples to form the expansion traverse is furnished by plumber.

Threaded outlet, male iron pipe. Can be screwed into wrought iron coupling or calked into soil pipe hub.

Fig. 190

Adjustable head with flat strainer regularly furnished. Can be equipped with convex or concave strainer

Fig. A

Strainer head for porcelain receptors having 4 1/2-in. diameter counterbore, and 3 1/2-in. diameter outlet

Fig. B

Strainer head for porcelain receptors having taper counterbore from 4 3/4-in. diameter to 3 1/2-in. diameter outlet

Brass Top and Hinged Strainer

For Nos. 105 and 107 drains. Made also with solid cover and hinged strainer

Swimming Pool Fittings

We manufacture a line of cast iron and brass swimming pool fittings. These fittings include overflow gutter drains, recirculating inlets, bottom drain outlets, side drain outlets, etc. All strainers are of polished brass and furnished with countersunk brass screws for attaching to the body of the fitting. The bodies are of cast iron and painted.

No. 196 Overflow Gutter Drain—Extra heavy cast iron body, painted, 2-in. iron pipe outlet connection, 2 3/8 x 4-in. heavy polished brass strainer attached to body with countersunk brass screws. Price, each, \$4.00.

No. 197 Recirculating Inlet—Extra heavy cast iron body, painted, 2-in. hub for soil pipe connection,

5 1/4-in. diameter, heavy polished brass strainer attached to body with countersunk brass screws. Price, each, \$9.50.

No. 198 Bottom Drain Outlet—Extra heavy cast iron body, painted, 6-in. spigot outlet for soil pipe connection, 13 1/4-in. heavy polished brass strainer attached to body with countersunk brass screws. Price, each, \$40.00.

No. 199 Side Drain Outlet—Extra heavy cast iron body, painted, 5-in. hub outlet for soil pipe connection, 6 1/2 x 12-in. heavy polished brass strainer attached to body with countersunk brass screws. Price, each, \$13.50.

SEEPAGE SHOWER DRAINS

The New Boosey Shower Drain alone combines these four desirable features:

The seepage openings are covered to prevent filling with cement when the floor is poured.

The lead pan connects to trap body by means of a lead caulked joint, guaranteeing an economical and water-tight connection.

The lead pan can be thoroughly tested by screwing a plug into trap inlet and filling pan with water.

For the rough test the trap body is tapped inside for plug during construction.

The Boosey shower drain embraces all the desirable features in shower trap construction.

Body of trap is cast iron, painted or galvanized or all brass, with adjustable strainers of several designs and of different inlet areas.

Depth of 2-in. trap body 6 in. Depth of 3-in. trap body 8 in.

BOOSEY'S BACK PRESSURE SHOWER DRAIN

Showers in club houses and schools because of intermittent use, often (for weeks) lose their trap seal due to evaporation, then sewer air flows from drainage system into building.

To overcome this condition is the reason for Boosey's back pressure shower trap. It is the same as the No. 126-R with the additional feature of

having a removable bronze metal vertical swing valve placed just below strainer, above trap seal where it is always accessible.

The automatic swing valve operates in a vertical position and is therefore always closed against back pressure.

Made in two sizes. Outlet either 2 or 3 in.

No. 126-R-B. P.

No. 130-R-70

No. 130-R-70

The No. 130-R-70 shower trap contains all the patented features of the No. 126-R (see page 1) and can be furnished with either 2, 3 or 4 in. tapped outlet.

Strainers can be furnished round or square in polished brass, nickel or chromium plated.

DRAIN HEADS, SERIES NO. 130

All have seepage flange cast to body of drain to conduct seepage, from around the strainer, into waste line. Often it is desirable to provide additional area for this purpose and this series of drain heads is especially designed to meet such a condition. A lead or copper pan, of the desired area, can be

secured to this drain with a calked joint, thereby making a positively water-tight connection at the junction of the pan to drain head—which may also be tested for leaks by filling pan with water. Bodies are cast iron, painted or galvanized, or all-brass. Waste outlets tapped 2, 3 or 4 in.

DRAIN HEADS, SERIES NO. 133

The drain bodies are shallow, to permit their use in concrete slabs as shallow as 3 in. The seepage flange, cast to the lower part of drain, forms an anchor securely holding the drain in the concrete. The upper portion of drain to which strainer is attached is grooved on the underside, for seepage, and secured to the lower section with brass bolts.

Seepage around strainer passes down to the seepage pan and enters waste line by passing through the grooves. These drains are recommended for lobbies, corridors, or areaways, where the use of a lead or copper pan is unnecessary. Bodies are cast iron; painted or galvanized, or all-brass. Waste outlets tapped 2, 3, 4 or 6 in.

DRAIN HEADS, SERIES NO. 134

With hub outlet and seepage waste. This floor drain is readily adaptable to meet various construction conditions, having a cast hub outlet, that may be calked to either cast or wrought pipe. Waste

connections to this drain vary from 2 to 8 in. Strainers are cast iron, painted, or brass, polished, nickel, or chromium plated. Drain bodies are cast iron; painted or galvanized

No. 134-H

DRAIN HEADS WITH TRAPS

Series No. 133-70—These drain heads are identical with Series No. 133, and therefore have the same advantages of installation.

The traps are cast iron, and furnished with or with-

out cleanouts. Waste outlets, tapped 2, 3 and 4 in.

Series No. 134-106—Similar to Series No. 133-70, except that connection to trap and drain head is a calked joint and has spigot outlet 2, 3 or 4 in.

No. 133-G-70

No. 134-CI-106

No. 133-CI-70

No. 134-D-106

Any drain can be furnished with iron or brass intermediate strainers at additional cost

URINAL DRAINS

Boosey's Adjustable Seepage Urinal Drain solves the waste connection problem of installation.

The waste connection is adjustable both vertically and horizontally. The vertical adjustment is by means of the thread cut on tail piece. The horizontal adjustment is even more simple, it is merely a slide adjustment of $1\frac{1}{2}$ in. for centering tail piece.

The lead pan connection is made by means of a raglet, formed around the upper portion of drain and into which the lead pan is caulked; the lead pan should extend at least 2 in. beyond the urinal base for it is at the junction of the urinal to the cement that a crack occurs, caused from contraction of the cement.

The seepage openings are formed by grooves being cast in the upper and lower side of the horizontal adjustment plate; each groove leads direct to waste above the trap seal.

The drain is made in two styles, the No. 135 a drainhead, and the No. 135-A is combined with a trap. Waste connection tapped either 2 in. or 3 in. The No. 135 drain is also furnished with 3 in. hub outlet. The body of drain is cast iron, painted or galvanized. The tail piece and seepage plate, brass. Strainers brass, nickel or chromium plated, or vitreous china.

Furnished with 3 in. hub inlet for auxiliary drain, also with all brass top, polished, nickel or chromium plated, at additional cost.

FACTORY DRINKING FOUNTAIN DRAIN

No. 870

An unusual type of drain, for, when used with a drinking fountain in factory service, it not only acts as a floor drain and receptacle for chewing tobacco, cigars and cigarette butts, but on account of bubble waste entering drain above strainer, it is self-cleaning, carrying all refuse down into waste line, greatly improving the sanitary appearance of a factory drinking fountain surroundings.

The body of drain is cast iron with intermediate strainer and bell trap for connection to storm water waste line. Where otherwise connected use a deep seal trap.

DRINKING FOUNTAIN DRAIN

No. 871

Cast iron body, adjustable brass N. P. strainer with openings around inlet for seepage. The side opening, tapped $1\frac{1}{2}$ in., makes it adaptable for either wall or floor waste connections. Strainer opening 2 in. and outlet opening 2 in. connecting with a nipple to trap in waste line.

Made in one size only, 2 in. outlet, diameter of strainer 4 in.

BRASS FLUSHING RIM FLOOR DRAIN

No. 130K

Floor drain with brass flushing rim for hospitals, sanitariums, operating rooms, morgues and laboratories. May be used with or without lead pan, depending upon the installation requirements.

The hinged strainer and flushed surface of drain are polished brass and easily accessible for cleaning.

SEDIMENT DRAINS

No. 160. Heavy duty floor drain with hub or tapped outlets, 3, 4 and 6 in. Carrying capacity approximately 20 tons.

No. 161. Same as No. 160 with the addition of 2 in. tapped opening for motor exhaust connections.

Nos. 181, 183, 184 and 185. Accessible sediment drains. X. H. cast iron with integral, lateral flange for seepage with non-tilting strainer. Waste openings, hub, spigot or screwed pipe connection. Furnished regularly as shown, but basket or back pressure valve omitted, if desired. These drains can be safely installed in a cement slab as shallow as 4 in. and have an approximate carrying capacity of 5 tons. Can be furnished with all brass top, polished, nickel or chromium plated at additional cost.

No. 188. Deep seal floor drain and with removable sand basket. Especially adapted for use where a floor drain having a deep seal trap and accessible dirt arrester are desired. X. H. cast iron with integral, lateral flange for anchoring, and supporting non-tilting strainer, having an approximate carrying capacity of 5 tons. Outlet, 4 in. hub only.

SLOP SINKS

We have standardized on one size, embodying in compact form the results of practically every request, for various forms of construction suggested during the past ten years. The diameter of frame is 14x14 in. Grate opening 12x12 in.

Modern stores and office buildings include provisions for restaurants, tea rooms, coffee and sandwich shops and soda fountains, and because of limited space slop sinks are necessary. Where and how they are used depends upon their construction.

Slop sinks of the Boosey line can be furnished with cast iron body, cast iron body and brass rim with open top, or with a removable intermediate strainer, brass or iron. Also furnished with back pressure valve or with removable aluminum basket.

Waste connections 3 or 4 in. for screwed connections hub or spigot.

Deep seal traps to correspond with the outlet of the slop sink can also be furnished, at additional cost.

No. 195

No. 193-G

No. 196

No. 195

Slop sink with removable aluminum basket, open top with polished brass rim. Can also be furnished with strainer.

No. 193-G

Slop sink with B. W. valve and brass hinged strainer.

No. 196

Slop sink with open top, brass rim and intermediate iron strainer.

NO. 109 FLOOD CONTROL DRAINAGE VALVES

Having the features of a manually operated gate valve with the additional automatic features included in a self-closing swing valve, and combining into one unit the features of both valves with the additional feature of being accessible from floor line, providing drainage construction that gives reliable protection to building.

The valve body is cast iron with removable head set flush with floor. The manually operated gate valve with non-rising stem is bronze metal of special design, made spade shaped, the lower part of gate forming an edge in order to cut through sewage if necessary when closing.

The bronze metal automatic swing valve opens inwardly into valve body, and being placed 2 in. above flow line through the valve there is plenty of lip clearance for closing. Its operation may be observed by removing valve cover.

The 3 and 4-in. valves are made standard in two lengths, 12 or 18 in. from center of outlet to floor line, and can be furnished any length from 18 to 36 in.

The 5 and 6-in. valves are made standard in two lengths, 14 and 20 in. from center of outlet to floor line, but can be furnished any length from 20 to 36 in. Where valves of addi-

tional length are required, they can be extended with soil pipe using the valve body and 12-in. gland head. In ordering, when valve length is not given, the short length will be shipped.

Made in four sizes, 3, 4, 5 and 6 in.

No. 113 backwater horizontal end opening drain. Designed for draining manholes, meter and elevator pits. Body and strainer cast iron, automatic valve bronze metal.

Note the lip clearance at valve outlet, providing additional valve clearance when opening and closing.

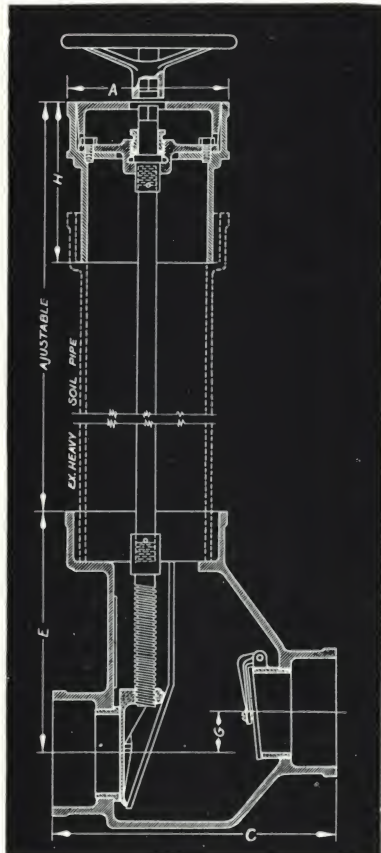

Made in two sizes, 4 and 6 in.

No. 116—A horizontal back water valve for hard service. The valve body is extra heavy cast iron with tee hub opening directly over swing valve, providing an accessible inspection opening that can be easily extended up to floor line with soil pipe, with hub end to receive cleanout with special flush brass plug furnished with valve.

The automatic valve is set with sufficient lip clearance to prevent lodging of foreign substance under the swing check.

Made in three sizes —3, 4 and 6 in.

No. 109

No. 109

At Left

No. 109 showing valve body with gland head extended to floor line with soil pipe, and doing away with the necessity of valve pit entirely.

When ordering valve for soil pipe extension, use the 24-in. length list.

No. 113

No. 116

SEEPAGE BACK PRESSURE DRAINS

For sub-basements. Constructed to resist back pressure and prevent water oozing up around the drain, after it is set, in the concrete floor.

No. 1115A drain consists of a cast iron cylinder, the upper end of which is threaded and into this opening is screwed an all cast brass trap with a brass lift check. The slip hub around cylinder forms a raglet, into which a lead or copper flashing is caulked. Diameter of brass strainer is 4 in., with waste openings sufficient to drain a ½-in. stream of water, under city pressure. Made in one size only, to caulk into 4-in. soil pipe hub.

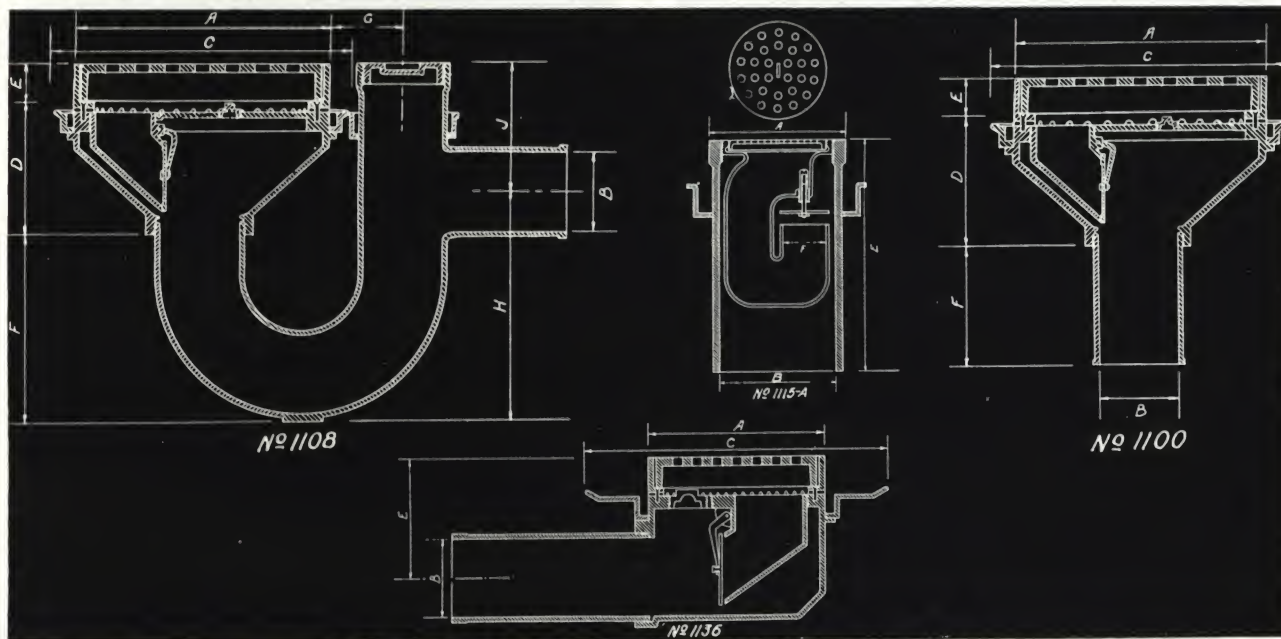

No. 1100 floor drain, body cast iron, painted or galvanized, with strainer, either brass hinged, or deep set removable iron. Circling the drain head two inches below floor line is a cast iron flange, with raglet, into which is caulked a lead or copper flashing. Made in two sizes, 3 or 4-in. Diameter of strainer, 9 in.

into which is caulked the sheet lead or copper flashing. Made in two sizes, 3 or 4-in. Diameter of strainer 9 in.

No. 1108 back pressure seepage floor drain with trap. Body cast iron, painted or galvanized, with either brass hinged or deep set removable iron strainer. Circling the drain head two inches below floor line is a cast iron flange, with raglet, into which is caulked a lead or copper flashing. Made in two sizes, 3 or 4-in. Diameter of strainer, 9 in.

No. 1136 back pressure seepage floor drain with side waste opening. Body cast iron, painted or galvanized, with either a brass hinged or deep set removable iron strainer. Circling drain head and two inches below floor line is a cast iron flange, with raglet, into which is caulked a lead or copper flashing. Made in two sizes, 3 or 4-in. Diameter of strainer, 9 in.

BACK PRESSURE FLOOR DRAIN NO. 108

A new idea in back water floor drain construction, that in comparison with other drains is giving unbelievable results.

The reason for this unusual dependable performance is that the sensitive automatic valve is located above the water line in a removable

iron cylinder where it is permanently protected.

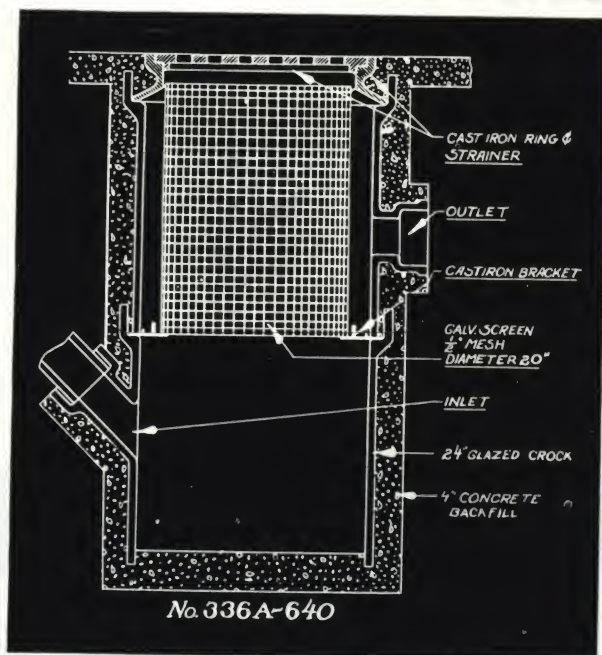

The valve is located on the inlet side of trap where it is accessible for cleaning or inspection by simply removing the strainer (no tools are required).

Boosey's back water valves are protecting millions of dollars in property investment operating constantly and so absolutely without maintenance cost that their owners have forgotten their existence.

Made in three sizes, 2, 3 and 4 in.

MISCELLANEOUS SUMPS

No. 336-A-640

Intercepting Sump Assembly No. 336A-640

To prevent foreign substances entering public sewer. It is often used in laundries, the discharge from all floor drains and washing machines passing through it.

The construction of sump consists of two or more lengths of glazed crock, back filled with four inches of concrete. The base of the top section rests on a round cast iron bracket placed in the hub of the lower section and on which is supported a galvanized iron removable screen.

Placed in hub, flush with the floor is a cast iron ring and cover with a carrying capacity of approxi-

No. 117

mately five tons. The ring is concave in shape, the concrete anchoring in to the side of ring to support the weight of traffic passing over cover. List \$69.46.

Tile Drain Sump

No. 117 illustrates an efficient back water, cast iron, tile drain sump and sand trap, installed to prevent sewage back flowing into the seepage tile around basement walls and filling the cinder bed under basement floor with raw sewage. In so doing it prevents foul odors and wet floor in basement.

Made in one size with 4-in. hub openings. List \$25.64.

Multiple Drain Sump No. 119

For the preventing of sewage back flowing into the seepage drainage system or up through floor drains.

Construction of sump is cast iron with bronze metal removable back water drainage valve connected to sump outlet.

Discharging into the iron cylinder of sump are three 4-inch hub openings providing either side or end waste inlet openings, above the waste outlet from sump.

The extension from sump to floor line is

No. 119

made with a metal form, back filled with concrete to floor line and covered with a cast iron ring with a removable cover.

Floor drains and seepage drains around wall should never be cross connected. Therefore, where both seepage and floor drain protection from back flowing sewage is required, they should drain into separate sumps. One for basement floor drains only, the other for seepage.

Made in one size, outlet 4 inch. List \$29.93.

FACTORY SERVICE COVERS

The number of sizes necessary to be carried in stock, the limited size of orders and slow turn-over on investment, is the reason so few drainage manufacturers care to invest their capital in permanent pattern equipment.

The result is the iron cover business is often turned over to local jobbing foundries who, not knowing the requirements, standard sizes, or conditions, make a few covers of uncertain design.

The result of this condition is plainly vis-

ible around many manufacturing plants by the lack of uniformity in cover design, the loose fit and clatter of covers, wrongly designed cover frames and a disregard of carrying capacity, resulting in sunken frames, broken covers and cement around the cover frame.

Practically our entire business consists in supplying architects' specifications; for this reason the above covers are of uniform design.

Carrying capacities are the result of laboratory tests.

These covers are made for various uses and can be furnished in cast iron painted, galvanized iron or brass.

ROOF DECK DRAINS

The construction of this drain is carefully planned for high class roof construction of tile, slate, asphalt or granolithic and is furnished in several strainer designs, round, square or dome, hinged or plain; in either iron or brass.

The body of drain is either cast iron, painted or galvanized; or all brass, with raglet cast around the tapped waste outlet. Into this raglet a metal flashing, either sheet lead or copper, is secured permanently to the drain with a lead caulked joint. Over the raglet is placed the seepage plate and it is secured to the drain body with brass bolts. To the seepage plate is secured the strainer frame, into which the strainer is fitted. Made in four outlet sizes—tapped 3, 4, 5 and 6 in.

No. 149 C. I. Deck Drain. Loose set XH strainer in either iron or brass. Diameter of top 9, 12 and 15 in. Outlet tapped 3, 4, 5 and 6 in.

No. 149-G Deck Drain with round hinged strainer. Diameter 9 or 12 in. Outlet tapped 3, 4, 5 and 6 in.

No. 149-146 Deck Drain. Dome strainer, iron or brass. Diameter of top 12 in. Outlet tapped 3, 4, 5 and 6 in.

No. 149-950 Deck Drain. Square brass frame and strainer. Diameter of top 12x12 in. Outlet tapped 3, 4, 5 and 6 in.

No. 149-1143 Deck Drain. Iron or brass beehive strainer. Outlet tapped 3, 4, 5 and 6 in.

ROOF SUMPS FOR METAL FLASHING

Roof Drains Nos. 141-146

A cast iron or brass roof sump for the better class of buildings. All connections are visible, convenient to inspect and permanently water tight under all weather conditions. The body and strainer are cast iron or brass with raglet

cast around outlet to which is caulked a copper or lead flashing for connecting to roofing felts.

Made in 5 outlet sizes, 3, 4, 5, 6 and 8 in. Either screwed thread or hub outlet.

No. 146

No. 146

No. 141

Roof Drain No. 1143

Cast iron or brass strainer with brass body. This construction requires the least possible space.

Made in four sizes with outlets 2, 3, 4 or 6 in. For

securing the copper or lead flashing to roof drain, a raglet is cast around outlet opening to which the flashing is soldered. Where side openings are required an elbow screwed to nipple is all that is necessary.

No. 1143

Roof Drains Nos. 143 and 1146

No. 1146. Cast iron roof sump, the outstanding features of which are ease of installation, permanence, and weather tightness.

An economical roof drain with all connections exposed for inspection. The copper flange which also forms the gravel stop, connects to sump by caulking the metal into the raglet surrounding the drainhead.

All measurements shown on dimension chart.

Made in four outlet sizes, tapped 3, 4, 5 and 6 in.

No. 143. Valley, gutter or porch drain with caulking raglet to which the metal flashing connects.

Measurements shown on dimension chart. Body and strainer cast iron, or cast iron body and brass strainer, or body and strainer all brass.

Outlet tapped 2, 2½ or 3 in.

Plate No.	Outlet	Strainer diam.	Grate opening sq. in.	List		Dimensions

No. 143

ROOF SUMP FOR FELT FLASHING

Cast Iron Roof Drains Nos. 140 and 148

Safe, economical and easily connected. The roofing felts clamp to the drain head.

(Omit metal flashing—Roofing felts only are compressible enough to make water-tight compression joint.)

Where metal flashings are specified use drain with raglet, into which the metal flashing is calked.

No. 140 and 148 furnished in sizes 3, 4, 5 and 6 in., with either hub or tapped outlets.

Expansion Joint

No. 665. Expansion joint for wrought iron conductor lines, four sizes, 3, 4, 5 and 6 in.

No. 665

THE BARRETT COMPANY

Roof Leaders and Roof Vent Connections

40 Rector Street, NEW YORK, N. Y.

For Branch Offices, see page on Roofing Materials

Products

HOLT ROOF LEADER and ROOF VENT CONNECTIONS (Patented).

For Roofing, and for Flashing for Brick and Concrete Walls, see Manufacturers' Index. For detailed description and specifications see Volume IV, Barrett Architects' and Engineers' Built-up Roofing Reference Series.

Holt Roof Connections

Holt Roof Connections, with their air-tight watertight expansion joint, overcome all the defects of both rigid and loose joint leader connections. They never tear away the roofing around the intake, never flood a building if the leader pipe stops up.

These connections are made for roofs of every type. They come complete—flashing flanges, expansion joint, gravel stop and attachment—everything all ready to install. There are no extras or waste time in soldering parts of the job.

The connections designed to meet the varying conditions presented by flat roof decks are:

Types 1-LG, 1-LS, 1-LT and 1-LM.

Types 6-LG, 6-LS, 6-LT and 6-LM.

Types 5-LG, 5-LS and 5-LM.

Types 1-VG, 1-VS, 1-VT and 1-VM.

Types 6-VG, 6-VS, 6-VT and 6-VM.

Types 2-LG and 2-LS are especially designed for use with sloping roofs, and have a wide field in connection with sawtooth construction, and wherever valleys or parapet wall gutters are so narrow that a specially designed connection is required. It is adjustable to varying inclines.

For types 1-LG, 1-LS and 1-LT and types 1-VG, 1-VS and 1-VT, a wide copper flashing flange is fused

to each of these connections. Fusing joints requires intense heat and extreme care in workmanship. It is a factory job and is a necessary operation to provide a permanent watertight connection.

For types 2-LG and 2-LS, types 6-LG, 6-LS and 6-LT, and 5-LG and 5-LS a wide copper flashing flange is furnished with each of these connections. All necessary parts are provided to bolt the flashing flange to the connection. This is the only dependable method of creating a watertight flashing joint, where a field operation is necessary, and types 2-LG and 2-LS, types 6-LG, 6-LS and 6-LT, and 5-LG and 5-LS come under this classification.

Specifications

For detailed specifications see Volume IV, Barrett Architects' and Engineers' Built-Up Roofing Reference Series.

Barrett's Free Roof Examination Service

For years, at the request of men interested in the maintenance of large buildings, highly trained Barrett Inspectors have made careful surveys of the roofs of all these buildings and rendered detailed reports.

In many instances such examinations have resulted in large savings in building maintenance.

On request, one of our inspectors will make a careful survey of your roof, flashings, walls, coping, etc., on all your plants in conjunction with your superintendent or your master mechanic. (This service is available for big buildings, structures with roof areas of 5,000 sq. ft. or more that are located east of the Rocky Mountains.) Address Barrett Roof Examination Service, THE BARRETT COMPANY, 40 Rector Street, New York, N. Y. In Canada, write to THE BARRETT COMPANY, LIMITED, 5551 St. Hubert Street, Montreal, Quebec.

THE H. W. COVERT COMPANY

Manufacturers of Drains

229 East 37th Street
NEW YORK, N. Y.

Product

ANTI-CLOG FLOOR DRAINS for use in factories, garages, dairies, stables, areas, etc.

For our pages on Fireplace Dampers and Smoke Chambers, see Manufacturers' Index.

Advantages of Removable Dirt Box

The dirt box set inside the drain body catches all dirt, sand and debris, which, if allowed to reach the soil pipe, would cause a stoppage in the drain pipe. The dirt box is equipped with a handle to facilitate removal when it is to be emptied and also has seepage holes to allow no water to remain in the box to stagnate or freeze.

Construction

Anti-clog Drains are made of heavy cast iron,

ANTI-CLOG FLOOR DRAINS

with either bottom or side outlet. The body is of one piece, there being no joints to loosen and allow seepage into the floor.

These drains may be provided with lead flashings which are worked into the waterproofing section and render the floor around the drain watertight.

Anti-clog Drains are caulked from the inside which makes it simple for the plumber to accomplish a satisfactory, watertight connection.

When it is required to have the trap within the drain, we can furnish a bell trap and replace the dirt box with a strainer plate.

No. 16 Drain Construction—The No. 16 drain has a very deep body providing a deep and capacious sediment box.

Especially designed for garage washstands where much sand and dirt is washed off the cars.

A large number of these drains are used in the Wawa Dairy Farms, Wawa, Pennsylvania.

Specification

Furnish and install as shown on plans Covert Anti-clog Drains with removable dirt boxes [with] [without] lead flashings with [side] [bottom] outlet, made by THE H. W. COVERT COMPANY, 229 East 37th Street, New York, N. Y.

gasoline, oils or other inflammable materials are used or stored, unless a system of mud, gas and oil basin (cast iron) is installed. Garages shall be classified

Also manufacturers of "ACME" Adjustable Floor Drains, with and without Automatic Backwater Valves; "PEERLESS" Garage Drains and "PEERLESS" Floor Drains, with and without Automatic Backwater Valves; "PEERLESS" Water Softener, "KOMPOST" Bricks, "ACME" Iron Closed-end Adjustable Closet Bends and Extensions; Iron Drum Traps, Clean-out Tees, End Ferrules, Refrigerator Drains; Blow-off, Catch and Gravel Basins; and other accessories to make a complete, perfectly sanitary plumbing drainage system.

How to Specify

Architects and Engineers should refer to figure number, size, outlets and the letter designation for the finish desired, when specifying the articles of our manufacture.

Sanitary Safeguards

Architects, sanitary engineers and contractors will safeguard the health and property of their clients by specifying this company's sanitary devices. As the trade-names "ACME" and "PEERLESS" imply, they are unexcelled in design and operation. They are durable in make and in every way reliable; no other devices on the market may be substituted without risk for this company's line as being "equally as good." The essential parts of these devices are patented.

This company manufactures the largest and most complete line of sanitary plumbing drainage specialties in the United States.

Garage Floor Drains

The following regulations governing drainage from garages and other establishments, where gasoline, oils or other inflammable materials are used or stored, have been adopted by a great many cities throughout the United States:

Garage floor drains (cast iron) shall be installed to avoid explosions, choked sewers, prevent accidents from formation of gases, and other complaints and nuisances common in automobile garages and other establishments.

Fig. 62. Dehn's "Peerless" Garage Floor Drain (Patented)

"A," Class "B," Class "C," Class "D," Class "E" and Class "F." Other establishments shall be classified according to the construction, size of the building, and number of persons employed on the premises.

Schedule of Capacity—The following schedule of capacities of "PEERLESS" Garage Floor Drains must be according to the following specifications here described and referred to as authority:

Every garage housing automobiles, hereafter constructed in the city of —, shall install a system of drainage basin (cast iron) to be provided with a removable receptacle (cast iron) inside of the basin to receive the mud and other material washed into the basin. The basin must be provided with an air chamber in the receiver, with a separate compartment constructed in such a manner that the direct discharge of water and other material can not come in direct contact with the fluid in the basin. The inlet of the receptacle in the basin must be provided with a guard (cast iron), having a solid top of sufficient size to entirely conceal the opening of the receptacle when discharging water or other material into the basin. The air chamber compartment must be provided with one 2-in. and one 4-in. vent hub connection. Top of basin to be provided with bar grate (cast iron). One 2-in. and one 4-in. vent stack must be connected with the air chamber. The 2-in. vent stack must be extended outside of the building at least 8 ft. from the lot level, and the 4-in. vent stack must be extended through the roof.

Class "A"—Where not more than one automobile is housed, one 12-in. diameter of top and 14 in. deep "PEERLESS" Garage Floor Drain shall be installed.

Class "B"—Where more than one and less than five automobiles are housed, one 15 in. diameter of top and 22 in. deep "PEERLESS" Garage Floor Drain shall be installed.

Class "C"—Where from five to ten automobiles are housed, one 20 in. diameter of top and 30 in. deep "PEERLESS" Garage Floor Drain shall be installed.

Class "D"—Where from ten to twenty-five automobiles are housed, one 20 in. diameter of top and not less than 38 in. deep "PEERLESS" Garage Floor Drain shall be installed.

Class "E"—Where from twenty-five to fifty automobiles are housed, two 20 in. diameter of top and not less than 38 in. deep "PEERLESS" Garage Floor Drains shall be installed.

Class "F"—Other establishments shall be classified by the Fire Prevention Board according to the construction and size of the building and number of persons employed on the premises, and such drainage shall be installed as may be approved by one in authority.

Fig. 62. (Patented) Showing Installation of Dehn's "Peerless" Garage Drainage System

Dehn's "Acme" Grease Traps

Designed to keep the water in the basin at a low temperature. By connecting the cold water supply pipe leading to the kitchen sink, range boiler and other fixtures with the water jacket in the basin, the water in the basin will be continually chilled to a very low temperature.

As soon as the greasy water enters the basin, the grease congeals and floats to the top of the water. The grease can be very easily removed by any one. The handhole is provided with a malleable iron saddle and heavy thumbscrew.

FIG. 113, PATENTED
Dehn's "Acme" Grease Trap Properly Installed in Kitchen

Fig. 113. Dehn's "Acme" Double Trapped Water Cooling Grease Trap (Patented)

Schedule of Capacity—The following schedule of capacity applies to Dehn's "Acme" Water Cooling Grease Traps when installed in residences, restaurants, hotels, boarding houses, large and public institutions.

No. 15-1—12 in. diameter of top, 15 in. deep, double trapped water cooling grease trap will fill the requirements when supplying from 1 to 25 people with 3 meals each day.

No. 18-1—12 in. diameter of top, 18 in. deep, double trapped water cooling grease trap will fill the requirements when supplying from 1 to 35 people with 3 meals each day.

No. 24-1—20 in. diameter of top, 24 in. deep, double trapped water cooling grease trap will fill the requirements when supplying from 1 to 150 people with 3 meals each day.

No. 30-1—20 in. diameter of top, 30 in. deep, double trapped water cooling grease trap will fill the requirements when supplying from 1 to 100 people with 3 meals each day.

No. 36-1—20 in. diameter of top, 36 in. deep, double trapped water cooling grease trap will fill the requirements when supplying from 1 to 150 people with 3 meals each day.

No. 24-2—24 in. diameter of top, 24 in. deep, double trapped water cooling grease trap will fill the requirements when supplying from 1 to 100 people with 3 meals each day.

No. 30-2—24 in. diameter of top, 30 in. deep, double trapped water cooling grease trap will fill the requirements when supplying from 1 to 150 people with 3 meals each day.

No. 36-2—24 in. diameter at top, 36 in. deep, double trapped water cooling grease trap will fill the requirements when supplying from 1 to 200 people with 3 meals each day.

Suggestion for Grease Trap Installation—For large institutions, it is suggested that a grease trap be installed for each individual sink, dishwasher, etc. For such installations, the minimum capacity of grease trap should be installed.

Note: Another new and improved water cooling grease trap is now under construction and will be placed on the market in the very near future.

When Dehn's "Acme" Double Trapped Water Cooling Grease Traps are installed and properly connected—i. e., the main cold water supply pipe connected with the inlet of the water cooler in the grease trap and the outlet of the water cooler with the cold water supply to range boiler or storage tank, and also with all the cold water faucets on the premises, including the cold water supply pipes to the closet tanks—the installation will permit the continuous circulation of cold water through the water cooler in the grease trap; hence, the grease accumulating in the grease trap will be congealed where it can easily be removed by any one.

Not a particle of grease can find its way out of the basin through the outlet into the sewer when Dehn's "Acme" Double Trapped Water Cooling Grease Traps are installed and connected according to these directions. (See illustration.)

When the grease traps are installed in restaurants, hotels, large and public institutions, the grease should be removed from the grease trap at least three times each week.

From this it will be readily understood that the results to be obtained from the grease traps depend largely upon the plumbing contractor who has the supervision of the installation of the grease traps, and the owner whose duty it is to appoint or elect some one to give the grease traps the required attention.

Dehn's Automatic Water Softening and Scale Removing Device

Dehn's Automatic Water Softening and Scale Removing Devices will overcome the accumulation of lime, magnesia and other incrusting minerals in waterbacks, coils in ranges, furnaces and heaters, tank, laundry or automatic instantaneous heaters, boilers and wherever these difficulties are experienced.

The Compound Injector is connected to the cold water supply leading to range boiler or storage tank. This will allow the minerals separated from the water to precipitate to the bottom of range boiler or storage tank, where they can be drawn off at sediment cock. More than twenty-five years in universal use. For every type of installation.

Instructions for installation for various conditions sent on application. For large institutions where a large volume of water is consumed daily; for general, domestic or high pressure steam purposes, where the water supply pipes are larger than 2 in. and it is desired to neutralize the water; in such institutions, it is recommended to install the Compound Injectors in batteries on the by-pass principle, similar to plate 15, as illustrated.

The water can be used for the same purposes after these devices are installed as it was before.

Dehn's "Acme" Deep Seal Floor Drains

Dehn's
"Acme"
Deep Seal
Floor
Drain
Fig. 9 Patented

These drains, with continuous pipe traps and automatic backwater valves, are also provided with large brass taper-threaded clean-out plugs and seamless metal ball floats.

These floats prevent flooding of cellars; can not get down into trap outlets and become air-bound, and can be easily removed with cage by unscrewing the four brass screws.

Products

FLOOR, SHOWER, URINAL and AREAWAY DRAINS.

**Signet Drain****Signet Drains**

Signet floor drains have heavy cast iron bodies with clean-out opening affording easy access to valve and sewer. They are equipped with cast brass backwater valves, which work automatically by gravity. The valves being submerged, work easily, the grease, lint, etc., come to the surface, insuring a clean seat and a positive seal.

These drains are a positive insurance against backwater or sewer gas, wet or dry. Now furnished with brass clean-out plug.

Chromium plated brass tops at extra cost.

**San-Seal-O Drain****San-Seal-O Drains**

Drains have heavy cast iron parts, and are made with brass backwater valves and also (plain) without valves. Unless definitely specified, we ship drains with valves. Body of drain is made in one piece with flange on inside to support the J-shaped inner, which is held in place by 4 brass screws. A rubber cord gasket forms the joint. Access to valve and sewer is obtained by removing the J-shaped inner.

Chromium plated brass tops at extra cost.

Gateway Drain

Patent applied for

Gateway Drains

All parts of gateway floor drains are made of heavy cast metal. The valve parts are made of brass, work automatically by gravity, and, being submerged, work easily. A large heavy inverted brass plug affords quick and direct means for cleaning out. Backwater valve is ground by hand, making perfect seal. All numbers have full 4-in. seal. Chromium plated brass tops at extra cost.

JOHN J. DONOVAN

Manufacturers of Plumbing Specialties

22 Church Street, BOSTON 11, MASS.

SOLD BY ALL DEALERS IN PLUMBING MATERIAL

CABLE ADDRESS
"DONOVAN BOSTON"

Products

"ECLIPSE" FLOOR DRAIN TRAP, REMOVABLE SAND CHAMBER and BACKWATER VALVE; DONOVAN GREASE TRAP; DONOVAN SELF-REGULATING SIDE STREAM BUBBLE DRINKING FOUNTAIN.

Also Non-siphon Trap.

Experience

Many years' experience as practical plumbers, fifteen of which John J. Donovan was inspector for the city of Boston, warrants the assumption that we are conversant with the best practice in plumbing construction. To maintain such a reputation, we present only products of lasting quality, suitable for the different purposes for which they are designed. Conforming to the most exacting code, their cost is ultimately cheaper than many made for the purpose but constructed to meet the lowest competitive price without regard to quality or efficiency.

"Eclipse" Floor Drain Trap, Removable Sand Chamber, and with or without Backwater Valve

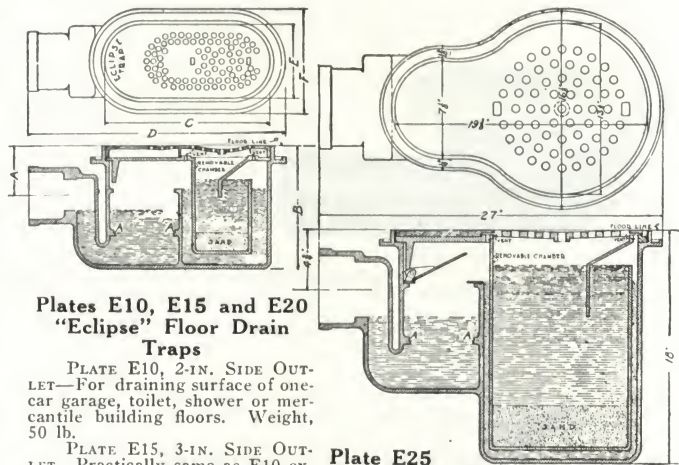

These features all embodied in one casting. Only one opening required in the floor. The "Eclipse" floor drain trap relieves surface quickly and prevents sand or sediment from entering and clogging drainage system. It retains all heavy matter in a removable chamber, easily emptied. A valve operated by inner chamber is always furnished on E20 and E25 traps. This compels immediate return of inner chamber when it has been removed for cleaning. Traps furnished in plain cast iron. Strainers regularly furnished in iron, or, when specified, in polished or nickelplated brass. To prevent breakage of strainers where heavy trucks pass over them a special steel strainer can be furnished when specified.

Satisfaction—A pleased client is your reward for having specified material which has stood the test of time.

Why experiment with floor drain traps which, when not satisfactory, must be removed from concrete, causing dissatisfaction and expense?

The "Eclipse" floor drain trap and sand arrester, with or without a backwater valve, after the severest test in the past ten years, can be depended upon to accomplish all that is claimed for it in draining floors in garages, powerhouses, boiler rooms, laundries, creameries, kitchens, showers, school toilet rooms and mercantile buildings of all kinds.

How to Specify—Floor drain traps to be "Eclipse" Plate No. E (insert number) with iron [polished brass] [nickel-plated brass] strainer and with [without] backwater valve, as manufactured by JOHN J. DONOVAN, Plumbing Specialties, Boston 11, Mass.

Plates E10, E15 and E20
"Eclipse" Floor Drain Traps

PLATE E10, 2-IN. SIDE OUTLET—For draining surface of one-car garage, toilet, shower or mercantile building floors. Weight, 50 lb.

PLATE E15, 3-IN. SIDE OUTLET—Practically same as E10 except that it has 3-in. outlet to conform to codes requiring this size. Weight, 55 lb.

PLATE E20, SPECIAL, 3-IN. SIDE OUTLET—Intended for garages where not more than 5 cars are housed and washed. Weight, 80 lb.

Plate E25
"Eclipse" Floor Drain Trap

Has 4-in. side outlet. The most practical for garages of any size, but more particularly for those having washstands in almost continuous use; also for boiler room, dairy and laundry floors or wherever much sand or sediment is anticipated. Weight, 225 lb.

"ECLIPSE" PLATES E10, E15 AND E20 FLOOR DRAIN TRAPS

Plate	Dimensions, in.						
	Outlet	A	B	C	D	E	F
E10	2	3 1/2	8 1/4	10 1/2	13	5	7 1/4
E15	3	4	9 1/4	10 1/2	13	5	7 1/4
E20	3 Special	4 1/4	10	12		6 1/8	8 5/8

Plate E30 "Eclipse" Floor Drain
(Patented)

Has 3-in. bottom outlet. Same as E15 except that trap to exclude sewer gas is omitted. If trap is required it may be placed on outlet below drain. Drain is intended for draining floors into sump or open waterway where trap is not required. Its main purpose is to prevent sand or sediment from clogging drain or entering sump chamber and injuring pump or ejector. Weight, 50 lb.

Backwater Valve for "Eclipse" Traps
(Patented)

One-third actual size. Can be furnished in all traps except E30, when specified. May be placed in position at A-A after trap is installed if found necessary. Accessible by removing strainer and inner chamber

Removing to Empty

Emptying Refuse

"Eclipse" Floor Drain

The chamber comes out and the sand with it

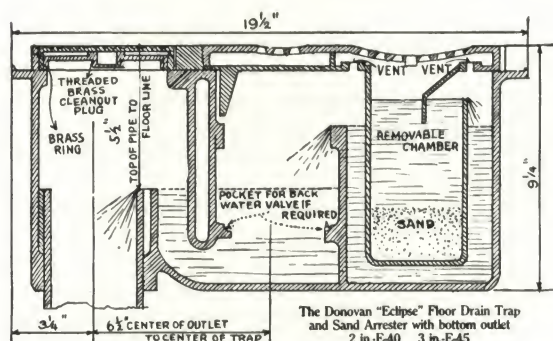

Plate E40 and E45 "Eclipse" Floor Drain with Bottom Outlet and Removable Sand Chamber

"Eclipse" with bottom outlet, including trap against sewer air, sand chamber and brass cleanout plug; backwater valve furnished also if required. These features distinguish this trap from E30 which has no trap against sewer air and is only used for special purposes as described.

It can be set in place before concrete is poured and afterwards connected to drain. This eliminates the necessity of sleeves through concrete and danger of their being displaced—it is never necessary to break out the concrete.

Two sizes: Plate E40, 2-in. bottom outlet; Plate E45, 3-in. bottom outlet

Donovan Side Stream Drinking Fountain Heads (Patented)

B140 N.P. is for use where pressure fluctuates. Maintains fixed stream under varying pressures for high buildings where draft on supply from lower floors is liable to reduce pressure. Maintains same drinking

Plate B140 Donovan Self-regulating Side Stream Drinking Fountain Head

Plate B135 Donovan Side Stream Drinking Fountain Head (Not Self-regulating)

stream with pressure reduced from 100 to 5 lb. For $\frac{3}{8}$ -in. iron pipe size.

B135 N.P. fountain head is for use where there is only slight fluctuation in pressure. Used by school commission, city of Boston, Mass., and many cities and towns in the United States. Bubbler and connections regularly furnished in nickelplated brass. Chromium plate when specified. For $\frac{3}{8}$ -in. iron size pipe.

Donovan Combination Drinking Fountain

B155 is a combination drinking fountain and self-closing basin cock. Can be furnished with either B135 or B140 fountain heads and may be attached to any lavatory. Desirable in office buildings, gasoline service stations, etc.

Plate B155 Donovan Combination Drinking Fountain

Donovan Grease Trap with Water Sealed Cover and Baffle Plates

Size, 12x12x10 in. with two 2-in. inlets and 2-in. outlet. Plate G10, made in cast iron, painted black. Floor to center of outlet, 9 1/2 in. Prevents grease, plaster of paris from dental laboratories, sand from optical grinding, and hair from passing into drain. Water sealed cover prevents the odor of grease escaping into building.

Plate G10 Grease Trap—Two Inlets

THE R. V. HARTY COMPANY

Manufacturers of Harco Premium Roof Sumps

1316 Maple Street
DETROIT, MICH.

Harco Premier Roof Sump

The Harco Premier Roof Sump is not the result of a sudden inspiration but the result of many years of experience with all the various kinds of roof drainage devices and careful study of their construction, their applicability to flat or pitched roofs, roof construction, roofing materials, flashings and how they function when subjected to flood conditions, refuse deposits, extreme temperatures, and particularly freezing conditions.

The Harco Premier Roof Sump was designed to meet all of these conditions and all these requirements and still maintain a rugged construction and low installation cost. It is fundamentally different from an ordinary sump with the perforated, smooth surfaces, domes and strainers, through which the water must trickle instead of flow.

Construction

The superstructure of the Harco Premier Roof Sump is composed of high-speed openings; the capacity of which is many times that sufficient for a full conductor pipe load under a siphon action.

A roof conductor delivers a maximum capacity of water only under a siphon action produced by the suction of a full or solid conductor load. The capacity of the high-speed openings, the spacious base bowl, and the non-stoppage features of the Harco Premier Sump produce and guarantee this action.

Flood and cloud-burst roof loads demand maximum conductor loads for relief guaranteed by the Harco Premier Sump. The failure of the ordinary trickle type roof sump is obvious during such periods of emergency.

Outstanding Features

Elimination of expensive copper flashing and lead calking, which usually results in humps and ridges around the sump.

No bolts to crack or break casting.

Easily and quickly installed and absolutely permanent.

Top or cover always removable for cleaning.

Top can be covered with overhanging steel plate, when the roof is subjected to heavy deposits of sand or cinders, as in foundries.

Sump sets down below the level of the surrounding roof surface, without the usual flashing and calking hump, thereby being adaptable to flat or level roofs.

Shallow self-cleaning bowl will not collect and hold the dirt, which should be washed down with the flow of the water.

Sump bowl, due to its special design, is crackproof even when frozen solid.

Maximum ceiling clearance, due to shallowness of bowl.

Sump bowl can be set in place or can be set in roof depression and connected, before any roofing is laid, thereby allowing the building to become floor-free sooner than with other sumps.

Roofing material can be laid later without disturbing the sump.

Short Specifications

At all points marked "roof sump" on plans, furnish and install Harco Premier Roof Sumps of sizes shown. Sumps shall be set using Harco Everlasting Plastic Cement as supplied with the sump and as directed by the manufacturer.

How to Install Harco Premier Roof Sumps

Prepare opening in the roof. Drop in the sump and connect to the conductor.

(Your roof is now floodtight.) No waiting for a layer of roofing, which is necessary, under all copper flashed sumps. Fill groove of bowl with Harco Elastic Cement. (Furnished with sump.) Lay roofing, regardless of sump location, over the entire roof. Cut hole in virgin sheet, at each sump. Set the cage ring (grooves of which have been filled with Harco Elastic Cement) in the corrugation of bowl. Place the deflector and top.

Harco Elastic Cement is the highest grade of cement on the market and is made from non-drying fish and linseed oil with an asbestos fibre and will immediately stand a tremendous head of water and will outlast any type of roofing material.

MAHON CAST IRON ROOF SUMPS.

For Mahon Permanent Steel Floor Forms, Steel Roof Deck, Kalamein and Tin Clad Doors and Rolling Steel Doors, see page numbers in Manufacturers' Index.

Mahon Cast Iron Roof Sumps

The Mahon Cast Iron Roof Sump has been designed for absolute weathertightness, permanence, and greatest ease of installation. It is the result of many years of roofing experience, and is thoroughly practical to meet the need for a permanent, economical roof drain.

Manufactured in durable cast iron, the Mahon Sump is free from springs, bolts or loose rings and requires no elastic cement or solder for installation. The dome strainer locks in place by a simple turn and may be easily removed without disturbing either the sump or surrounding roofing. The sump bowl is fitted permanently into the roof deck and a copper apron, furnished with or without gravel stop, is calked into a raglet in the sump casting provided for the purpose. When used on gravel top roofs this gravel stop and the extremely narrow openings in the side of the dome strainer, provide a double protection for the drain.

Connection to the conductor pipe is made by means of threaded joint which is a standard pipe thread and

makes a perfect watertight connection.

Mahon Sumps never cause water to back up or lie on the roof—the strainer openings being equal to three times the area of the conductor pipe for which the sump is tapped. Mahon Cast Iron Sumps may be furnished tapped to fit 3, 4, 5 or 6-in. standard wrought iron pipe thread. Quantity production on this product permits an unusually low price.

Outstanding Features

(1) Sump is available tapped to fit either 3, 4, 5 or 6-in. standard wrought iron pipe. If cast iron conductors are used, a short piece of wrought iron pipe is screwed into the sump and calked into the hub of the cast iron pipe.

(2) A 16-oz. copper apron with or without gravel stop is furnished to be calked into a circular raglet in the sump bowl with lead, thereby making a perfect watertight connection with roofing material.

(3) Dome strainer may be removed without disturbing sump bowl or surrounding roofing.

A simple turn engages four cast iron lugs which lock the dome strainer securely in place.

(4) Openings in dome strainer are equal to three times the area of the conductor pipe, insuring full capacity of the drain at all times.

Note: A flanged ring can be furnished with Mahon Cast Iron Roof Sumps for use in connection with steel roof decks.

Service

When requesting information or recommendations, consult our Engineering Department at Cleveland, sending sketch of conditions to be met.

JOSAM FLOOR, SHOWER AND URINAL DRAINS

Materials

Cast iron, "Duriron," "Everdur," brass, nickel, white metal. Galvanized cast iron, "Duriron," "Everdur," or all-brass drains at extra cost. Adjustable brass strainers regularly furnished nickelplated, brass grates regularly furnished polished, unless otherwise specified. Brass strainers and grates chromium plated at extra cost.

Josam Double Drainage Feature

Description—The double drainage feature is exclusive in Josam drains and positively prevents water seepage around drain through floor to ceiling beneath, thus providing *leakproof* protection. Specified by leading engineers and architects.

Josam Double Drainage Combined Trap and Drain

200A Series
—Heavy cast iron body with adjustable brass strainer to suit floor thickness variations. Strainers for porcelain shower receptors also furnished.

Josam Positive Clamping Device

Insures an absolute watertight connection between roof and drain body, or between the floor and drain, by securely holding the roofing or waterproofing membrane to the inner surface of roof drain or flanged cup of floor drain.

Any Josam Drain having flanged cup can be furnished with clamping device at \$1.00 extra.

JOSAM FLOOR, SHOWER AND URINAL DRAINS (Continued)

Josam Double Drainage Drain without Trap for Shower Receptors and Urinals

3000 Series—

Equipped with brass strainer—especially recommended for stall urinals and shower receptors. Equipped with adjustable double eccentric brass bushings, which will compensate for inaccuracies in roughing-in up to 1½ in. in any direction.

300C Series—For shower stalls. Body, cast iron; strainer, nickelplated or polished brass. Can be installed in connection with independent trap. Various types of strainers furnished, all adjustable to meet varying floor thicknesses. Equipped with flashing ring and clamping device which firmly holds waterproofing membrane in place. Also furnished without clamping device. This 300C Series can also be furnished with side outlet in the 1½, 2, and 3-in. size outlet where for any reason a drain with side outlet is preferable or necessary. (See table below for 300R Series.) With or without clamping device.

Josam Combined Drain and Trap with Removable Sand Bucket—Open Deep Seal Type

710A Series—

A new type, of which the body, trap, rectangular hinged grate and removable sediment bucket are cast iron. Has a threaded brass cleanout plug, flush with floor, 2 in. larger in diameter than the trap outlet. Furnished with or without all-brass gravity action backwater valve. Trap is open seal type. This type is of moderate size and price, is recommended for small garages, boiler rooms or in places where a drain with removable sediment bucket is required. Furnished with threaded, hub or spigot outlet.

Price.....	\$20.00	22.00	25.00

760B Series—This drain is the box, hinged grate and sediment bucket of Series 710A described above, but without trap and cleanout.

This drain is made with bottom outlet for inside calking or with side hub outlet.

Dimensions in Inches

No.	Outlet	Wt., lb.	Price
762B	2	60	\$14.00
763B	3	60	14.00
764B	4	60	14.00

Note: When this Series is desired with side outlet, add "R" after "B" and mention on what side the outlet is required.

Josam Combined Drain and Deep Seal Trap with Backwater Valve and Threaded Brass Cleanout

750A Series—Where it is desired to install a combined drain and deep seal trap with cleanout this series drain will meet all necessary requirements. The brass cleanout plug on outlet end to trap is flush with the floor and of handhole size, and the trap itself is self-cleansing. The backwater valve flap is the same size as the sewer outlet, maintaining full waterway from the drain to the line.

Trap has spigot end outlet, but can be furnished threaded when so ordered.

574JM	4	8	24	9.00

Josam Non-clog Drain

960NC Series—

Designed for use in garages, manufacturing plants, roadways, or any place where waste waters contain a high content of sand or solids.

Waste water, sand, and solids are directed to an ample size, easily removed

sediment bucket through means of conveyor, which is directly below grate surface, and a high neck retainer guards against rise or surge of incoming waste waters, so that all floatage and solids are retained in sediment bucket and prevented from entering waste lines.

Grate used is a new departure in grate design, in that auxiliary means are provided in the grate that allow floor drainage at all times (preventing flooded floors), if for any reason main outlet becomes clogged. This drain can also be provided with means of intercepting and retaining oil from waste waters within the drain (Series 970NC), preventing entrance into sewer of the oil and its consequent volatile gases.

Extra heavy japanned cast iron construction throughout; 4-in. seal; 4-in. hub outlet connection. Brass backwater valve can be provided and caulked in when so ordered. Made with or without additional auxiliary vent at no extra cost.

Dimensions in Inches						Price

hospital floors, or other places where sanitation is an important factor. The drain is of self-cleansing design with no fouling spaces. Interior of drain is white enameled throughout. The opening for jet into flush rim is not drilled through, but can be drilled for any size that the water pressure requires. Polished brass top with special hinged perforated and removable strainer is furnished with this drain. This drain is also furnished without the trap and is listed under Series 1083A.

Josam All-Brass Drain with Side Outlet

2010S Series—Although this drain is smaller in design, it is quite ample for draining cornices, window sills, small balconies, or where drainage is required in any small surfaces where construction requires a shallow drain with side outlet, either 45° or 90°.

JOSAM ROOF DRAINS AND VENT STACK SLEEVES

Josam Improved Roof Drain with Removable Combined Sediment Cup and Dome Strainer for Wood, Concrete or Tile Roofs

410S Series—This drain affords an absolutely watertight connection between roofing and drain body without use of flashing. This is accomplished by an improved type clamping ring that has the same surface contour as flange of drain. This clamping ring is held securely in place by four adjustable manganese bronze clamping posts, each receiving a 3/8-in. set-screw, the tightening of which permits any desired pressure on clamping ring, under which roofing felts are clamped. Made of heavy cast iron, eliminating possibility of condensation when buried in roof slab.

This series can also be furnished with square top flange at no additional cost, and is designated as Series 410SL. Also furnished with side outlet at \$2.00 additional list, and designated as Series 410SR. Also furnished with side outlet and square top flange at \$2.00 additional list, and designated as Series 410SRL. Josam Expansion Joint can be furnished with this or other types of Josam Roof Drains with bottom outlet, where necessary, at added cost.

Josam Improved Overflow Angle Roof Drain

1250 Series—A recently designed angle roof drain with a large outlet area and overflow connection. Recommended where large roof drainage facilities must be provided for, and use of overflow is desirable.

Installation takes up minimum space in roof out from parapet wall. Rear slotted wall of this drain provides waterway to overflow if main outlet becomes clogged.

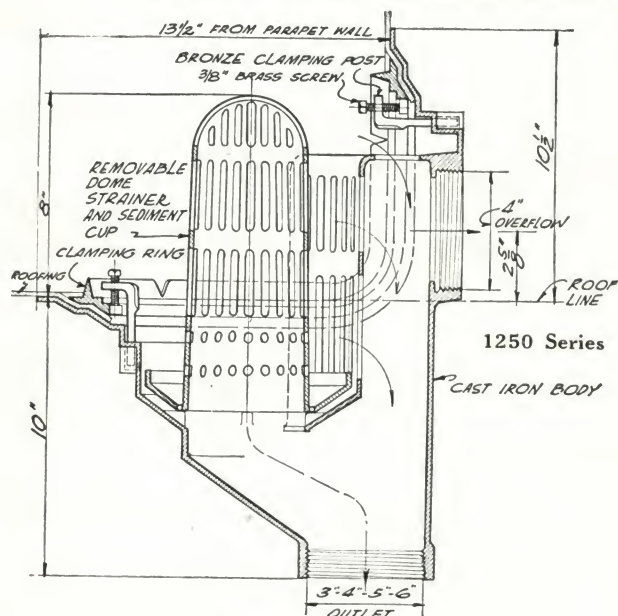

Drain has removable combined dome strainer, sediment cup and clamping ring, similar to Josam 410S Series, affording positive tightness between roofing felt and drain body.

Made in 3, 4, 5, or 6-in. threaded or inside calked outlet, and with 4-in. threaded overflow, as shown, but can also be furnished with two 2-in. additional auxiliary overflows in upper portion of rear vertical walls.

Regularly furnished in janned or galvanized cast iron, also in brass at additional cost.

A horizontal grate similar to a promenade grate can be furnished in place of the dome strainer at extra cost. See cut and table on following page.

Josam Improved Double Drainage Roof Drain, with Removable Combined Sediment Cup and Dome Strainer for Concrete Roofs

430BS Series—In addition to having Josam double drainage feature, this drain affords a positive means whereby roofing felts are joined to the drain body with an improved clamping ring, that has the same surface contour as flange of drain and is held securely in place by four adjustable manganese bronze clamping posts, each receiving a 3/8-in. brass setscrew, the tightening of which permits any desired pressure on clamping ring, under which roofing felts are clamped. This insures an absolutely watertight connection between roofing felts and body of drain, and eliminates use of flashing.

Series 430BS has Josam removable combined sediment cup and dome strainer that can be removed easily for cleaning, thus keeping drain clean. Heavy cast iron construction eliminates possibility of condensation when buried in roof slab. Tapped for standard iron pipe thread. Soil pipe connectors for all sizes and all series of Josam roof drains can be furnished. Galvanized at added cost.

Josam Roof Drain for Narrow Valleys or Gutters

450G Series—Specially designed with a narrow body for use in gutters, on hip or flat roof construction.

Furnished with clamping ring and square head brass bolts with washers, which firmly hold gutter lining place, assuring watertight connection.

Equipped with Josam combined removable sediment cup and high dome strainer.

Especially recommended for gutter widths of 8 in. or over.

This series can also be furnished with square top flange at no additional cost, and is designated as Series 450GL. Also furnished with side outlet at \$1.00 additional list, and designated as Series 450GR. Also furnished with side outlet and square top flange at \$1.00 additional list, and designated as Series 450GRL.

Josam Vent Stack Sleeve

Josam Vent Stack Sleeve

610A Series—This new type cast iron vent stack sleeve is designed to positively eliminate the necessity of a copper or lead flashing. This sleeve can be placed in position during the construction of a concrete or wood roof deck and the vent pipe carried through it at any time.

The hub or space at the top of sleeve between the pipe and sleeve should be filled with oakum and a roofer's elastic cement or poured lead joint, thereby making a watertight joint between sleeve and pipe.

Josam Sawtooth Roof Drain—No Flashing Required

490GC Series—This drain is really made to the exact pitch of the roof—the square top flange of the drain body is in the same plane and at the identical pitch of the slope of the roof. It is constructed of cast iron with round body and square top flange, and is suitable for wood, concrete, precast slab, sheet rock pyrofil, or any plastic slab design.

The labor and troublesome adjustment accompanying the installation of the so-called convertible type sawtooth roof drain is entirely eliminated when this Josam 490GC Series is used. No tilting or tipping is necessary to have it in line with the roof surface. Neither is there any reason for unsatisfactory connections, as the outlet is maintained as a true vertical line.

No *flashing* is necessary when the Josam Sawtooth Roof Drain is used, as the roofing membrane is laid on the even upper surface of the square flange top of the drain body which is in the same angle or bevel as the plane of the roof surface.

There is absolutely no perforation of the roofing material at any point of contact with the drain body, as the clamping ring arrangement is so designed that the pressure points are entirely within the limits of the opening made in roofing for draining area.

Cast iron removable dome strainer and sediment cup has ample waterway for the various size outlets, and is easily removed for cleaning, and just as easily replaced. No tools are necessary for its removal—no unscrewing of bolts or nuts—in fact, no disconnection of any kind. It is simply lifted out

by hand, dumped and replaced; consequently a clean drain is maintained without any troublesome connections.

JOSAM SEWER AND SWING CHECK VALVES AND SHOCK ABSORBERS**Josam Open Seat Backwater Sewer Valve**

Has bronze working parts and brass insert seat. Regularly furnished with bolted down iron cover. Can be furnished with threaded brass cleanout plug (see table). Body is of cast iron equivalent to extra heavy soil pipe. Outlet end is offset providing clearance of 1 1/2 in. below the valve seat and valve disc allowing free passage of foreign matter through valve to outlet, precluding possibility of fouling valve.

Valve always opens about 3/4 in., except when functioning by flow of water in either direction. Double knife edge or fulcrum bearings positively respond to slightest movement required of valve. Revolving disc or flap valve insures positive seating.

When required, opens sufficiently to permit full waterway. Machine faced flanged connections can also be furnished in all sizes at extra cost.

Josam Flap Valve—(Open Seat) Series 1100-1/2 for sewer outlets, sewer and water lines, sewage disposal plants. Construction and operation similar to backwater sewer valve. Placed at the discharge end of sewer line the Josam flap valve is an absolute safeguard against back flow of sewage. Permits full waterway. Prices and sizes same as Josam sewer valves.

Josam Open Seat Swing Check Valve

Holds and controls bodies of liquid matter. Has open seat with revolving flap check or disc suspended on compound acting double fulcrum bearings. The disc, normally, hangs open about 1/8 in., permitting continuous flow regardless of sluggishness in circulation and closes readily with the slightest back flow movement of the water.

The globe shape of the high grade red brass body permits circulation of water around and under valve disc when valve is partially open, and permits flow of full area of line when valve is completely open. Large hexagon cap plug permits easy accessibility to working parts.

Other than Josam check valves have closed seat and single pin bearings.

Josam-Marsh Shock Absorber

Recommended for quieting waterhammer in pipe lines of any diameter or any pressure. This device consists mainly of two chambers of extra heavy malleable iron secured about a centrally located Everdur diaphragm of extreme resiliency. This diaphragm absorbs and dispels the shock arising from the thrust caused by sudden stopping of water from quick closing valves and faucets, eliminating noise and relieving the line from strain and possible damage. It is not an air chamber. Further details and prices upon request.

**Josam-Marsh Shock Absorber**

JOSAM ADJUSTABLE CLOSET OUTLET CONNECTION WATER-TIGHT AND GAS-TIGHT

No Putty Joints—Sanitary—Adjustable—Positive—Permanent

A simple and positive means for making a perfect and permanent seal between closet bowls and waste pipes.

Eliminates the use of putty, litharge, plaster of paris, etc., which dry out and deteriorate, causing the seal to crack or break upon the slightest settling of the building, and leaving openings for escape of sewer gas and water.

Provides plumbers with all necessary adjustments and facilities for easily and quickly obtaining an absolutely water-tight and gas-tight seal. Fits all regular makes of closet bowls. Contains many unusual features, which greatly reduce installation costs.

Showing Features of Construction

A graphite saturated closet gasket of finest quality seals the closet bowl with the connection. This gasket will never dry out or harden, constantly maintaining a positive and permanent seal regardless of any settling of the building. Being very flexible and resilient this gasket also acts as a cushion to prevent breakage of bowls or connections.

Threaded brass floor flange is vertically adjustable for any distance ordinarily required, and can be set at proper height to fully compress the closet gasket and seal the joint of the closet bowl with the bowl resting firmly upon the floor, and with no strain upon the joints or connections below. The seat for the closet gasket is extra wide, and is also extra deep in order to contract the gasket and prevent it from "spreading."

The vertical adjustment overcomes all difficulties generally encountered with ordinary non-adjustable connections, such as variations in level of finished floors, thickness of floor constructions, variations in closet bowl outlets, or unavoidable variations in locating the piping or fittings below.

A graphite saturated inner gasket of finest quality seals the brass floor flange with the cast iron body. This seal is also perfect, and will hold absolutely tight under all conditions. A threaded adjustable brass locking ring, having finger grips for adjusting it to proper position, supports the inner gasket and locks the floor flange to the body. The 45° taper on lower end of

floor flange expands and compresses the inner gasket against the inner threads of the body.

Cast iron internal test plate (or external test cap, which is furnished to order only) seals the connection for the water or other test usually required by plumbing inspectors. Metal thread protector prevents damage to threads from concrete, etc. Wood cover prevents damage to rim of floor flange, and also prevents debris from entering waste lines. Extra heavy $\frac{5}{8}$ -in. brass closet bolts and necessary gaskets are provided.

All parts are completely assembled at our factory, and the complete connection is then tested under 50 lb. hydraulic pressure before shipment. The connections can be installed just as received from the factory, and no further work or attention is required before closet bowls are installed.

Numerous practical tests, based on a very extensive study of the subject, have conclusively demonstrated that the Josam Adjustable Closet Outlet Connection overcomes all of the difficulties and meets all of the conditions required in obtaining dependable, sanitary installations of closet bowls. Truly it is "a much needed improvement."

JOSAM-MARSH INTERCEPTORS

Josam-Marsh Grease Interceptors

The Josam-Marsh Grease Interceptor is a decided improvement over devices previously used for the recovery of all kinds of grease. It is scientifically designed to recover the grease from waste water regardless of the water temperature.

It automatically evacuates all sediment, thereby leaving clean grease in the interceptor. This grease has a high commercial value as the removal of the sediment prevents decomposition, eliminating the forming of "free fatty acid gas" which destroys the glycerine properties of the grease. Glycerine content being essential to its value.

All odors which would result from sour water are eliminated, as the water is continually changing, evacuating the sediment which would cause fermentation and decomposition if allowed to remain in the interceptor. These advantages insure complete sanitation under all conditions.

Outstanding installations have paid for themselves in a year or less from the revenue obtained from the sale of the clean, high quality grease retained by the Josam-Marsh Interceptor.

Due to the construction of the Josam-Marsh Interceptor, the grease is recovered before reaching the waste lines. This entirely eliminates any trouble and maintenance cost due to grease clogged waste lines.

The Josam-Marsh Interceptor is not water-jacketed, thereby eliminating the cost of piping from cold water supply. Has no movable parts, is easily installed, portable, can be placed on floor or hung from ceiling. Type A-0 can be held on wall brackets, furnished at extra cost.

By simply removing the cover, the entire chamber is accessible for the removal of grease. Grease accumulation can be skimmed off at any time without interrupting operation of interceptor.

The Josam-Marsh Grease Interceptors are made of heavy cast iron, in a complete range of sizes covering practically any requirement. They are constructed with the visible double wall seal as illustrated, or with the internal seal.

Constructed with flush top cover so that Interceptor can be located in floor construction with top flush with floor.

A-0, A-1, A-2, A-3, A-5 in both single and double wall seal types are provided with means of height adjustment.

The inlet and outlet on A-0, A-2, A-3, A-5 and A-15 both types, can be increased as shown in table.

Finish—Painted enamel.

Josam-Marsh Hair and Sediment Interceptors

D-4 Visible Double Wall Seal Type—For lavatories in barber shops, beauty parlors, residences, etc.

D-4 Visible Double Wall Seal Type

This interceptor will prevent clogged pipes by removing from waste water all hair and foreign matter. Has cast brass nickelplated body 6 1/2 x 3 3/4-in. and has 2-in. seal. It has inlet connection for 1 1/4-in. outside diameter brass tubing. Outlet is tapped for 1 1/2-in. iron pipe. Removable plug permits ready accessibility to brass filter screen. Is non-siphoning. Weight,

6 lb. Installation of this type permitted in all localities.

List price\$12.80

D-3 Type Josam-Marsh Hair and Sediment Interceptors—Same in construction and operation as the Type D-4, except that Type D-3 has an internal wall or partition seal, which is not permitted by many sanitary codes.

List price\$12.80

Josam-Marsh Dental and Surgical Sink Interceptors, Type C-2—Similar to Type C-1 in construction and operation. Is smaller and lighter. Recommended for dental, surgical and operating room sinks. This interceptor will remove from the waste water all solids, plaster, metals, cotton, lint, hair, etc. It is 10 1/2 in. high, 5 in. square and made entirely of polished aluminum,

excepting the screen which is brass. Has a 3 1/2-in. water seal and is non-siphoning. Inlet and outlet tapped 1 1/2 in. Bottom is removable for cleaning. Weight approximately 8 1/2 lb.

List price\$36.00

Type C-1 Josam-Marsh Hospital Plaster Sink Interceptors

Will remove from waste water all plaster of paris, either solid or in state of suspension, also cotton, lint, hair or other foreign matter which the waste water may contain. The Josam-Marsh Hospital Plaster Sink Interceptor is made of gray cast iron, porcelain, white enameled exterior,

with all exterior clamps heavily nicked. It is 18 1/4 in. high, 17 1/4 in. square and has 2-in. iron pipe connections. The cage is galvanized iron and the screens of brass. The interior is easily accessible for cleaning, in that the entire cage can be easily removed without any disconnecting.

Waste water enters through inlet pipe, is baffled and carried over the vertical plates and is then passed through the fine mesh-screens where the process of filtration takes place. The interceptor is absolutely non-siphoning and has 7 1/2-in. seal. Weight, approximately 240 lb.

List price\$130.00

Fleming Leak-proof Floor Drains

Manufactured especially for shower, bathroom, natatorium and hospital floors, and all other types of construction where waterproofing membrane is required for plumbing connections.

Drains with the positive waterproof joint. All Fleming drains are especially designed to make positive, watertight joints, using 6-lb. or any weight cold sheet lead, copper or heavy waterproof fabric. Furnished in brass or galvanized or chromium finish at extra cost. Bolted connection positively prevents leakage to the ceiling below.

Fleming Adjustable Hospital Floor Drain—This new drain embodies the latest achievements in sanitary engineering, and has the special feature of being "adjustable" to various floor thicknesses. Especially designed with non-fouling inner surfaces. Has flushing rim to body and lower trap jet for cleaning and removing sediment, using direct hot or cold water or steam pressure to destroy germ life. Designed especially for hospital floors, operating rooms and science laboratories. Furnished with extra heavy nickelplated cast brass hinged strainers. Furnished chromium plated top, bronze or galvanized body at extra cost.

Fleming Leak-proof Roof Drains

Series "A"—Slab Type (Marine Specification)—Roof drains with the positive joint. For concrete and fireproof slab roofs, or wood roofs, can be used with or without waterproof flashing. Positively insures against leakage to ceiling below in all weather conditions when properly installed.

Fleming roof drains can be used with or without flashing using any weight sheet lead, copper or waterproofing fabric. Furnished in galvanized, brass, bronze or aluminum at extra cost.

Fleming Variable Angle Roof Drain

Fleming Variable Angle Sawtooth Roof Drain

For concrete, wood or fireproof slab roofs. A sawtooth roof drain embodying the feature of draining a sawtooth roof from any desired angle of building construction—yet adaptable to drain the V-shaped trench without any extra or special pipe fitting.

Furnished with double tapping and plugged on one side, giving right or left-hand side outlet piping connection. Has extra large water area and embodies the usual Fleming feature—the positive watertight joint.

Service to Architects

Architects' mechanical file prints giving full size data and measurements, etc., illustrating all Fleming drains as adapted to the various types of building construction will be cheerfully forwarded upon request. We solicit your problems for plan service which is furnished gratis. Write for complete catalogue.

THE RILE COMPANY, INC.

Manufacturers of Roof and Floor Sumps

247 McDougall Avenue
DETROIT, MICH.

Products

ROOF and FLOOR SUMPS.

Introduction

There has been a long-felt want among architects and engineers for a more lasting, permanent connection between roof and rain leaders, than that afforded by ordinary sheet metal. The integrity of any roof is restricted to the duration of its materials, for no roof can be stronger than the connections between roofing and rain leaders.

Roof Sump

Description—The Rile roof sump is an efficient, non-freezing, permanent rain conductor roof connection, forming a part of the general roof construction. It will effectively exclude foreign matter from the euduction or leader pipe.

Made of cast iron, the Rile roof sump is standard with many of the best architects and engineers for all classes of buildings and the various types of roof construction, including concrete, wood, book tile, hollow tile, gypsum roof tile, Federal tile, American tile, Truscon tile, or Hy-Rib.

Advantages—The Rile roof sump can not be readily broken, or stopped up, and is always accessible for cleaning.

Costs no more than the old soldered sheet metal types. Tapped for 4, 5, and 6-in. soil or wrought iron pipe.

The action of steam or sewer gases leaking through the drainage system and vented through the rain leaders has no effect on the Rile roof sump.

There are no soldering acids to cause trouble; no breaking of joints by expansion, contraction and buckling.

It will outlast the average roofing materials and is in position for the renewal of roofing or plumbing connections.

The use of Rile roof sumps effects a saving of from 3 to 6 weeks' time in the completion of every concrete structure in which they are used. By simply screwing a nipple and elbow to base of sump with a temporary pipe to discharge water outside of the building, sumps are ready for service the minute the structural roof slab is in place. Until such time as centering can be removed, to allow plumber to extend conductors and connect same, the lower stories are kept dry for flooring, the roof valleys and finish can be prepared for roofer, and finished roofing can be placed in advance of the plumbing.

Construction—Sump is made entirely of highest grade gray cast iron, and is entirely free from nuts, bolts, packed joints or other soldered or mechanical parts, and can be used for either wrought or cast iron conductor pipes. Main body, in the form of a cone frustum, is expanded into a flange at upper end. A removable cover, having perforation in the top and side openings, is seated in an annular seat in body by means of a peripheral flange. Bottom of body is screw-threaded to connect the cast or wrought iron euduction pipe.

Within the body is placed a removable catchbasin with integral perforated standpipe. Over the top of the catchbasin is placed a strainer, having perforations arranged radially and increasing in size toward the

periphery, so that bulk of water and any foreign substance will pass downwardly (if at all) between the walls of catchbasin and the walls of standpipe strainer, and any foreign substances be retained in catchbasin.

Operation—The coarser foreign substances will be kept out by the cap. Smaller particles which may pass through the cap will be stopped by the strainer. Still finer sediment will be arrested and held in catchbasin.

Sump is readily cleaned by removing cap, strainer and catchbasin.

Installation—In order to properly secure sump to roofing so as to form a perfectly tight and strong joint, there is provided in upper flange of the body an annular dovetail groove, into which the inner circular edge of flashing plate is placed, by being flanged downwardly and inwardly. Dovetail groove is then filled with molten lead and calked, forming a perfectly tight, strong and permanent joint.

This means of securing the roofing metal work or flashing to sump is an important feature, as well as the general design of main body containing catchbasin, strainers, etc., in which the major portion of sump is suspended below the roof and subject to action of dissipated heat units within building, thus insuring its non-freezing qualities—an important factor in the design of buildings containing high tension electrical generating and transmission apparatus.

Specifications—Contractor for plumbing (or roofing) will furnish and place as indicated on drawings (location of sumps should be indicated on architect's working drawings), or as required (state number required 4, 5, or 6 in.) standard cast iron Rile roof sumps (THE RILE COMPANY, INC., 247 McDougall Avenue, Detroit, Mich.). Plumber to pour and calk final lead joint between flashings and sumps. Flashings to be provided and applied by contractor for roofing.

New Floor Sump

For use with any type of flooring—wood, plastic or cement. Dimensions: Body 11½ in. deep over all; tapped 4 in. only; top member round, 17-in. diameter, with cupped edge and heavy standing flange with 6 weep holes for seepage into sump.

Shipped with regular pot and flat strainers and a heavy flat top strainer. (Three strainers.)

Ideal for laboratory, laundry and washroom floors.

SUPERIOR CAST ALUMINUM ROOF AND FLOOR DRAINS

MANUFACTURED BY
SUPERIOR SKYLIGHT COMPANY, INC.

95 Webster Avenue
LONG ISLAND CITY, N. Y.

For Stage Skylight Ventilators and Projection Room Ventilators, see Manufacturers' Index

Superior (Cast Aluminum) Roof Leader Connections

- A Few of the Outstanding Features—**(1) A flexible lead expansion joint which absorbs the contraction and expansion caused by the settling of the leader line.
(2) Made of cast aluminum which is non-corrodible and stronger than cast iron.
(3) Equipped with an inner warm air chamber, making it anti-freezing.
(4) Hydrostatic test by the Columbia University Laboratory showed no leak when tested to 43 lb. to the square inch.
(5) Adaptable for all types of roof decks.
(6) Easy to install—no adjustments, no nuts, bolts or fitments necessary.
(7) Economical in cost and cuts down installation time.

Flexible Lead Joint—The flexible lead connection of convoluted folds between the bowl and conduit permits *expansion and contraction (approximately, 3 in.)* when the leader line settles, preventing damage to either roof deck or drain connection. This flexible lead joint is protected by an inner discharge tube which also forms a warm air pocket that will stop condensation and pre-

Type A
Connection

vent freezing. On the outside, the flexible joint is protected against infiltration of concrete by a temporary corrugated paper collar.

Wide Lead Flange—The wide lead flange insures a permanent watertight connection between the leader box and the roof.

Lower Ends—The lower ends are ferruled to lead-calk into cast iron pipes, or threaded for wrought iron pipe.

Columbia University Test—A recent hydrostatic test by the Columbia University laboratory showed no leak in connection between lead and aluminum when tested to 43 lb. per sq. in.

Adapted to Any Type of Roof Deck—The Superior (cast aluminum) roof leader connection is adapted to any type of roof deck. For roofs of flat brick or tile, inlaid slate or smooth cement, connection is furnished with a cast aluminum "tile stop." Bowl is provided with suitable "gravel stopper" when leader is to be used on a roof of gravel slag or other plastic material.

Should you have any unusual construction jobs in mind, write to us and describe the needs. We will be glad to co-operate.

Type "A" Roof Leader Connection

Type B
Connection

This is intended for installation with a cast iron leader line and is provided with a ferrule end to be lead-calked into the leader line.

Type "B" Roof Connections

This is made with a threaded end for use with threaded wrought iron pipe. Otherwise it is similar to type "A."

Type "C" Roof Drain

Without an expansion joint and is intended for use when the roof deck is too close to the underneath ceiling to permit the larger types to be used.

Type C
Connection

Type "L" Roof Drain

Type "L" is the same as Type "C" but made with side outlet for calking.

Particularly adaptable for ceiling use where height from ceiling to finished roof is limited and where conditions do not permit a straight connection to the leader line.

Type L
Connection

Detail of Type A Superior Roof Leader Connection

Size leader	A	B	C	D	E	F	G	H	J	K Roof opening	L	Wt. lb.
2	2	13 1/2	8 1/4	6	2	1 3/4	1 3/4	9 3/4	11 1/2	5 1/2	2	7 1/4
3	3	15	8 1/4	6 3/8	3 3/4	1 3/4	1 3/4	9 3/4	11 1/2	6	3	7 1/4
4	4	19	11	9	5	1 3/4	1 3/4	12	13 3/4	7 1/2	4	14
5	5	21	12 3/4	10 3/8	5 1/2	1 3/4	2 1/2	12 3/4	15 1/4	8 1/2	5	18
6	6	21 1/2	13	10 3/8	5 1/2	1 3/4	2 1/2	13	15 1/4	9 1/2	6	22 1/2

Table gives approximate over-all dimensions in inches and will be helpful when drawing up specifications.

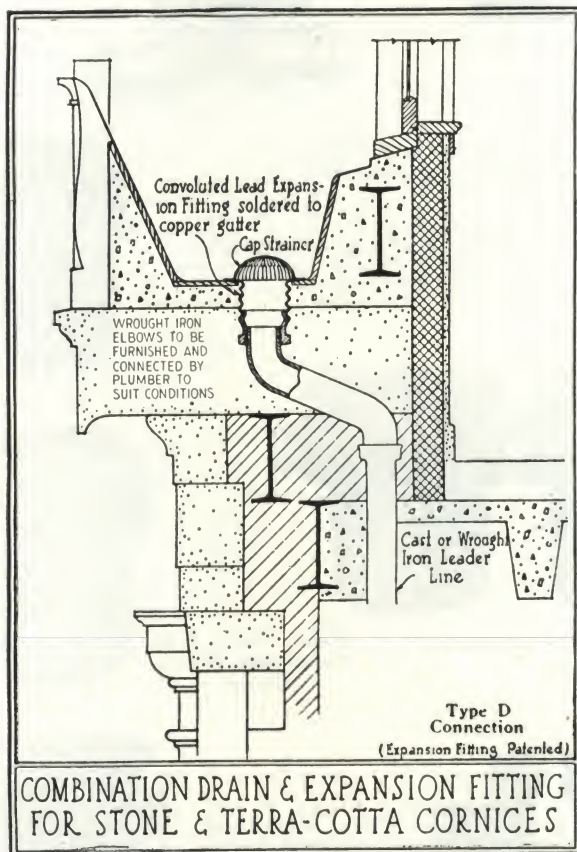

Type B: The dimensions of Type B are the same with the exception of the heights. The heights of Type B for leader sizes 3, 4, 5 and 6 in. are 7 1/2, 9, 12 and 13 in., respectively.

Type "D"

This is the same as Type "A" except for the elbow offset for stone and terra cotta cornices.

Type D Connection

Type D Connection
(Expansion Fitting Patented)**Strainers**

Three types of strainers may be had. A cap strainer which sets over the entire bowl, a flat strainer which is used on promenades, and a bowl strainer which sets down into the leader bowl.

Bowl Strainer

Flat Strainer

Cap Strainer

Tile Stop

Made of aluminum for use on roofs of flat tile or smooth cement finish.

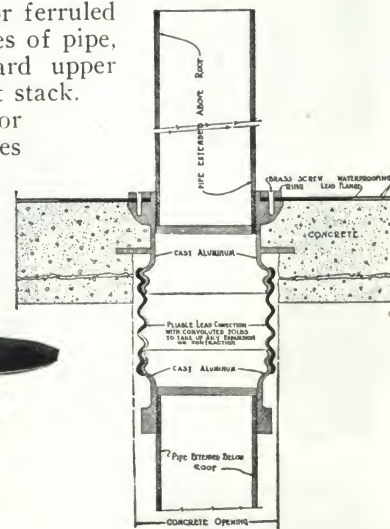

Tile Stop

Type "E" Expansion Vent Roof Connections for Vent Stacks

Type "E" is designed to be used in connection with long vent lines and affords a roof connection with all the advantages of our roof leader connections. It is made of aluminum castings with a flexible lead expansion joint and is threaded at the upper end to take a section of wrought iron threaded pipe.

In some localities a 4-in. vent stack is the smallest permitted, although a smaller line to the roof is allowed; therefore, the 2-in. and 3-in. sizes can be made with the lower end threaded or ferruled for these smaller sizes of pipe, but with the standard upper end to fit a 4-in. vent stack.

Made in 4, 5 or 6 in. and special sizes to order.

INCORPORATED

Manufacturers of Tanks and Tank Towers

2290 Brook Street
LOUISVILLE, KY.

Products

WOOD, STEEL and GALVANIZED TANKS, any shape or size, for any purpose; TUBULAR, ANGLE or CHANNEL COLUMN STEEL and WOOD TOWERS.

Also manufacturers of Railroad Water Stations; Tank Agitators; Steel Standpipes; Tanners' Drums; Power Transmission Machinery which includes: Friction Clutches, Friction Clutch Cut-off Couplings, Cast Iron Pulleys, Shaft Hangers, Safety Set Shaft Collars.

Cypress Tanks

This company specializes in cypress, as it is the best wood for tanks for most purposes. It has great durability with minimum shrinking and swelling, and gives no taste or coloring.

For some acids, yellow pine is recommended. Poplar, white pine, cedar and fir are also used.

Made round, elliptical and rectangular.

Specifications—Lumber to be thoroughly dry, without loose or unsound knots, splits, shakes, pecks, wormholes or other defects; all heart on inside; sound sap on outside, and then not to exceed one-half of the thickness of stave.

Thickness—2 in. for 10,000 gal. or less; 2½ in. up to 20,000 gal.; 3 in. for larger sizes. Finished thicknesses to be ¼ in. less than above.

Standard Inside Diameters of Round Tank—Every 6 in. from 3 to 9 ft.; every foot to 16 ft.; and every 2 ft. above 16 ft.

Standard Inside Depths of Round Tanks—

1 ft. 5 in.	4 ft.	6 ft. 5 in.	15 ft. 4 in.
2 ft.	4 ft. 5 in.	7 ft. 5 in.	17 ft. 4 in.
2 ft. 5 in.	5 ft.	9 ft. 5 in.	19 ft. 4 in.
3 ft.	5 ft. 5 in.	11 ft. 5 in.	21 ft. 4 in.
3 ft. 5 in.	6 ft.	13 ft. 5 in.	23 ft. 4 in.

Finish—Staves to be dressed both sides with edges machine jointed to proper bevel. Bottom to be dressed on top side only with edges machine jointed and square and well doweled.

Hoops—Round hoops to be of wrought iron (not steel) with malleable iron draw lugs; sizes and spacing to give a factor of safety of 4 to 1 or greater if required.

We also manufacture rectangular tanks of all dimensions and capacities.

Our Research Department will be glad to go into any special problem with you.

Tank Covers—Standard wood covers are supported by trusses and rafters and covered with 1-in. sheathing and Ruberoid roofing.

Flat wood covers are also furnished for frost protection when specified.

Tank Foundations

Realizing to what an extent the success of the tank depends on its foundation, we have made a careful study of tank foundations and have developed a series of standard designs which are not only of the proper strength but also use the minimum of material.

Cypress Tank

Steel Tanks

Hemispherical bottom steel tanks for elevated water storage are, in the larger sizes, as inexpensive in first cost as wooden tanks. Steel tanks are being extensively used in industrial plants and are the tanks for storage of oils, gasoline, alcohol and certain chemicals.

Caldwell steel tanks are made in every shape and for all purposes. We furnish these tanks all riveted, welded, or riveted-welded as required. Tanks can be shipped completely assembled up to 10½ ft. in diameter. Knocked down tanks are all punched, bent to shape and accurately fitted in our shops, with necessary erecting rivets furnished.

Tank Towers

Standard steel towers are of the following types: tubular column and angle column for flat bottom wood and steel tanks; latticed channel column for wood and hemispherical bottom steel tanks.

Standard Heights—*Tubular*—Every 12 ft. from 15 ft. to 100 ft.

Angle—Every 10 ft. from 12 ft. up.

Latticed—Every 5 ft. from 20 ft. up.

Erected anywhere.

150,000-gal. Tank, 205-ft. Tower, Studebaker Bros. Mfg. Co., South Bend, Ind.

Products

HORTON ELEVATED STEEL TANKS for Sprinkler, Mill, Private Estate, Golf Club, Municipal, Railroad, Surge and General Service; STEEL STORAGE TANKS of all types for the storage of both liquids and solids.

STEEL PLATE CONSTRUCTION including: Gas Holders; the Hortonsphere and the Hortonspheroid for the storage of gas and liquids under pressure; Smokestacks; Penstocks; Standpipes; the Wiggins Floating Roof; the Wiggins Breather Roof; Oil Refinery Equipment; Riveted Pipe; Bins and Bunkers; Digesters.

Horton Standard Elevated Tanks

The ellipsoidal-bottom tank combines the advantages of elevated storage with a structure which is

ELLIPSOIDAL-BOTTOM ELEVATED TANKS

Nominal capacity, gal.	Tank dimensions			
	D	H	B	K
15,000	15'6"	8'9 1/2"	3'7"	12'4 1/2"

2,000,000	80'0"	35'6"	26'0"	61'6"

Height to bottom—any even foot, except for capacities of 30,000 gals. or less, which are furnished in standard story heights. We will quote on nearest standard height to actual requirements.

pleasing in appearance, yet designed in strict accordance with approved structural practice. The large diameter and relatively shallow shell allows but little variation in head between the high and low water lines.

The large steel riser is riveted solid to the bottom of the tank and requires no expansion joint. It provides additional support for the tank, and requires no wooden frost casing as the diameter is large enough to prevent freezing solid. The inlet and outlet pipe extends up into the riser several feet, allowing sediment to settle below its opening. A washout valve may be installed if advisable.

HEMISPHERICAL-BOTTOM ELEVATED TANKS

Height to bottom—any even foot, except on capacities of 30,000 gallons or less. These small capacity tanks are furnished in standard heights only. When asking for quotations on small capacity tanks please state the actual requirements. We will furnish our next largest standard tank at a cost less than that for an odd size of special design.

Information Required in Making Quotations on Elevated Water Tanks

(1) Type of Tank—ellipsoidal or hemispherical bottom. (2) Capacity of tank required, gallons. (3) Height of tower, top of foundations to bottom of tank. (4) If tank is used for sprinkler service, state whether stock company, mutual or F.I.A. requirements. (5) Which, if any, of the following accessories manufacturer is to furnish: riser pipe, foot elbow, frost casing, overflow, indicator, tank heater. None of these accessories are included in quotations, except when expressly specified.

Steel Plate Construction

Our service includes the design, fabrication and erection of gas holders, Hortonspheres for high pressure storage, smokestacks, penstocks, standpipes, Wiggins floating roofs, Wiggins breather roofs, the Hortonspheroid, oil refinery equipment, steel pipe, bins and bunkers, digesters and other steel plate work.

Products

ELEVATED STEEL TANKS: for water storage and fire protection for buildings, plants, factories, golf clubs, private estates, municipalities and railroads.

Also Standpipes and Steel Reservoirs for water storage; Storage Tanks for oil, acid, gasoline, molasses and other liquids; Surge Tanks, either simple or differential for hydro-electric projects; Steel Stacks; Penstocks and Steel Pipe; Structural Steel and Plate Work.

Standard Tanks and Towers

After thirty-four years' experience, we have standardized the manufacture of our hemispherical bottom elevated tanks.

The designs most generally used are carried in stock, completely fabricated and ready for shipment.

Designs and materials for other standard tanks with capacities from 5,000 to 1,000,000 gallons are on hand, and these structures can be fabricated and shipped very promptly.

See the table below.

Homeopathic Hospital,
Rochester, N. Y.

50,000 gal., 100 ft. to bottom

Fisher Body Corp.,
Detroit, Mich.

40,000 gal., 20 ft. to bottom

Oshkosh Country Club,
Oshkosh, Wis.

40,000 gal., 75 ft. to bottom

Chesebrough Mfg. Co.,
McKees Rocks, Pa.

50,000 gal., 100 ft. to bottom

Note: Distance center to center of adjacent columns (c.c.) is $.707D + .2(H + \frac{1}{2}D) + 1\frac{1}{2}$ in. The length of one side of the square plot of ground required may be determined roughly by adding 10 ft. to the above formula.

Boldface type indicates tanks and towers completely fabricated and ready for immediate shipment. Designs and materials for the other sizes are on hand; these structures can be fabricated and shipped very promptly.

*This tank has a segmental bottom.

Roof Tanks

Should be used only when no suitable ground space is available for a standard water tower.

If you contemplate a roof tank on a new building, consult us in regard to the proper spacing for the tower supports when you plan the building.

City Water Works, Marblehead, Mass.
1,430,000 gal., 90 ft. high

Special Tanks and Towers

Will be designed, fabricated and erected to meet unusual conditions. Write for plans and estimates. If possible, give us the following information about the tower under consideration:

- (1) Use—for factory, plant, office building, golf course or municipality.
- (2) Capacity.
- (3) Height of tower to bottom of tank.
- (4) Erection conditions at proposed site: if on a building, give number of stories and spacing of the supporting columns; if on the ground, give the area of clear ground space available.

(5) Distance from nearest railroad.

Co-operative Service

Our engineers will be glad to discuss with you any questions concerning use, capacity, height and erection sites for steel storage tanks.

Write or wire our nearest office for designs and estimates of the tanks you need. Plans, specifications and quotations will be promptly sent, without any obligation on your part.

Submit your plans for special tanks, for structural steel or for plate work for estimates.

Send for our Industrial Tank Catalog No. 10, or our Municipal Water Works Catalog No. 10.

Des Moines City Ry. Co., Des Moines, Iowa
217 ft. high, 13 ft. diam. at top

ATLAS COPPER & BRASS MFG. CO.

Coppersmiths and Brass Finishers

Products

POLARSTIL, Water Distilling Apparatus.

Also Copper Kettles, Copper and Lead Lined Tanks.

Polarstil

Experiment and research by some of the foremost scientists in the country have proven that even the water which is secured from supposedly sanitary sources carries a high percentage of bacteria, certain types of which are beneficial, but a large number certainly disease-carrying organisms. These revelations have caused movement towards the increased use of distilled water for drinking and all sanitary purposes. Schools, industrial concerns, and hospitals, in particular, are rapidly adopting the principle of supplying their own distilled water.

Polarstils in various models were designed only after exhaustive research had revealed a simple and economic method of distilling water in large or small quantities.

The construction of the Polarstil embodies a very simple design. The condensing chamber is free of coils and pipes.

The open interior construction facilitates easy cleaning and handling, and the automatic principle of operation is simplicity itself.

No matter how dirty, hard, full of sulphur or chlorine your water may be it will come forth from a Polarstil pure, crystal clear, aerated and palatable.

Steam Operated Polarstil

The principles of design upon which the Polarstils are dependent are outlined below:

Steam Operated Polarstil with Storage Tank

(1) Economical Vaporization—

- (a) Efficient source of heat.
- (b) Large evaporating surface.
- (c) Small volume of liquid to be heated.
- (d) Water preheated before delivery to evaporating chamber.

(2) Efficient Condensation—

- (a) Large area of condensing surface.
- (b) Condensing surfaces both water and air cooled.
- (c) Minimum amount of cooling water.
- (d) Minimum loss of uncondensed vapor.

(3) Freedom from Impurities—

- (a) High temperature of condensing water at surface.

- (b) Height of vapor traveling from evaporating chamber.
- (c) Wide vapor flue.
- (d) Efficient steam separator.

POLARSTIL

(4) Freedom from Mechanical Trouble—

- (a) Elimination of condensing tubes and coils.
- (b) Easy accessibility to all parts for cleaning or repair.
- (c) Bottom and evaporating coils hinged to base for easy removal.
- (d) Practical drain and flushout.
- (e) Interchangeability of parts.
- (f) Material, copper and brass.
- (g) Compact.

SIZES OF STEAM OPERATED STILLS

No.	Capacity per hr., gal.	No.	Capacity per hr., gal.
0	10	6	150
1	15	7	200
2	25	8	300
3	50	9	400
4	75	10	500
5	100	11	1000
Marine Stills			
0	10	2	25
1	15	3	50

Larger sizes built on order.

Note: Storage tanks are not included in our quotations unless requested.

Sizes 1, 2 and 3 may be mounted on wall brackets.

Direct Fired Polarstils

Direct Fired Polarstils have the same construction as steam operated stills, with the exception of the steel evaporator, an addition to their equipment. This serves to evaporate the raw water into vapor form, sending it up to the distilling chamber, where it goes through the same process of distillation as in a steam operated still. No pressure built up in evaporator.

Can be operated by natural or manufactured gas, oil, or, if desired, combustion chamber can be equipped with grate to burn coal or wood.

Automatic controls operate after burner is started. When storage tank is full, still and burner automatically shut off.

Direct Fired Polarstil

Guarantee

The capacities of all Polarstils are guaranteed to be as rated.

The distilled water produced is guaranteed to be free from mineral or organic matter, either in suspension or solution, and of the highest degree of purity and sterility required for technical, manufacturing or drinking purposes—that it will not be flat or insipid to the taste, but equal in palatability to any of the best known table waters.

Services

Let us solve your water problems. Our Engineering and Laboratory Departments are at your disposal.

BUHRING WATER PURIFYING CO.

42 Murray Street, NEW YORK, N. Y.

REPRESENTATIVES

NEW YORK, N. Y., BOSTON WATER PURIFIER COMPANY, 40 Murray Street
BOSTON, MASS., BOSTON FILTER CO., Harvard Square, Charlestown District

CHICAGO, ILL., ALLEN FILTER SERVICE, 505 No. State Street

Products

WATER PURIFIERS, FILTERS.

Also Drinking Fountains, Sanitary Bubblers, Coil Coolers.

Buhring System Purifier

The Buhring System Purifier is for filtering and purifying water used for drinking purposes in hotels, restaurants, homes, offices, ice plants and other places where water free from impurities is essential. The Buhring eliminates all organic matter, either in suspension or physical solution, as well as considerable matter in chemical solution. The water is also decolorized and deodorized as the foreign matter is removed.

The Buhring System Purifier delivers the water pure and sparkling with all of its natural qualities retained.

Construction—The purifier is a cast iron pot with removable cover, protected against corrosion, which holds the filter bed. The pot has a water inlet at the top and outlet at the bottom.

Inlet and outlet fitted with standard screw pipe threads for connection to water system. The filter material consists of perfectly sterilized granulated charcoal of different grains, asbestos and a moulded carbon block. A perforated pipe passes through center of carbon block and is sealed by rubber washer at top and bottom of block screwing into outlet connection of pot.

Operation—The water entering the top of the purifier is released in a bed of loose granulated charcoal (a spreader is placed in this bed to force water over larger areas) passes through to a layer of asbestos cloth, through the asbestos cloth to another bed of charcoal where it strikes the carbon block, forcing its way to the outlet pipe. The larger and heavier impurities are stopped by the charcoal fields and final purifying is done by the carbon block.

Carbon Block—The density and hardness of the carbon block is proportioned according to the pressure and quality of the water where purifier is to be used. Density of each block being determined after location is decided. The carbon block is replaceable and should be renewed when absorbent properties become inert.

Sizes—The Buhring Purifier is made in three sizes, Nos. 14, 15 and 16.

BUHRING

Reg. U. S. Pat. Off.

No. 16—For use where quantities up to 100 gallons per day are needed.

When a quantity in excess of 100 gallons per day is required, the No. 16 is used in parallel, and any capacity can be obtained this way.

The units are then hung in rows to suit the location allotted to them and connected by means of tinned brass headers and fittings.

Double units in compound.....	2	4	8	12	14	16	18	20	22	24	30	36	40

No. 15—For use where not more than 20 gallons per day are needed.

No. 14—This size Purifier was designed chiefly for use with electric water coolers and can be installed underneath most of them, being only 8 in. in height. Inlet and outlet connections are on the side so as to eliminate headroom and castings are heavy enough to withstand most any water pressure met in ordinary practice. Different types of brackets can be used to support purifier in various positions. No. 14 has a capacity up to 15 gallons a day.

DIMENSIONS AND CAPACITIES

Size, No.	Dimensions, in.	Inlet, in.	Rate of flow, per min., gal.	Capacity, per year, gal.	Weight, lb.
14	8 x 8	3/4	1 1/2-1 1/2	5000	20
15	8 x 12	3/4	1 1/2-2	7000	25
16	12 x 22	1 1/2	1-3	35000	100

Rate of flow will vary in accordance with water pressure and density of carbon blocks used. Capacities are based on New York, N. Y. water when in normal condition, or its equal.

For drinking water systems, figure one No. 16 Unit for every gallon per minute capacity of circulating pump.

Electric Refrigeration—Buhring Purifiers are readily connected to any automatic system for cooling the water and will give excellent results.

Tests—The Buhring Purifier has passed many tests in its 39 years of service. Results of said tests furnished upon application.

Cleaning—Cleaning is by renewal only. When flow of water becomes too slow, the filter materials must be replaced.

Records are kept so that on orders for renewals the correct carbon block can be furnished.

Calclite (Zeolite) Water Softener

The Calclite mineral has a higher exchange value than most zeolites on the market, giving a greater capacity between regenerations. The mineral is of crystalline, white, porous structure, always delivering clear soft water. It is specially adapted to use for the household, laundry, industrial plants, and hotels.

Complete units of both pressure and gravity types are furnished. In the pressure types we furnish both vertical and horizontal units with interconnecting piping where more than one unit is supplied. The equipment includes all the necessary piping, control valves, water meters, and brine tank.

The features of quick regeneration and greater capacity between regenerations makes the Calclite Softener the most satisfactory for domestic use, as attention to the equipment is reduced to a minimum. Valves are conspicuously marked and full directions for installation and operation are furnished.

Calclite Water Softener

Rate of Flow Indicator

Designed for accurate, simple indication of water velocities by means of a Pitot tube inserted in any size line—wood, steel or cast iron.

Venturi Meters, Rate Controllers, Recorders

Builders Iron Foundry equipment, all sizes and capacities.

Crane-Warlo Water Softeners

These up-flow systems, for the removal of all lime and magnesium in water, are supplied in sizes and capacities for every use, industrial, domestic, and municipal. The tanks of the smaller domestic machines are of corrosion resisting cast iron; those of the larger, of welded steel; and those of the industrials, of steel, both riveted and welded. The distributing system is planned to supply water uniformly to the mineral bed at any flow rate; avoiding both channeling and packing. Top

strainers prevent the loss of mineral and eliminate rate of flow controls. A patented timing funnel regulates accurately the time of contact between mineral and brine, regardless of pressure, while the patented double regeneration cycle saves salt and water waste.

The mineral used in all Crane Softeners is Doucil C-W 40. It is unique in that it

combines the high capacities of synthetic minerals with the rapid flow rate of natural green sand.

Industrial Softeners

Style D meets practically any requirement. It has a softening capacity four times that of green sand and will produce full capacity and a constant supply of zero soft water at a flow rate as high as 10 gallons per minute per square foot of tank area. Standard sizes range from

24 to 120 in. tank diameter; special sizes for any capacity.

Domestic Softeners

The Electro-Matic, the Semi-Automatic, and the low cost CW.

Electro-Matic

—Two sizes: No. 1700 for water up to 40 grains per gallon hard; No. 1702 up to 60 grains. For each size, two styles are made, softener

mechanism being the same, the type of automatic control varying.

Style A—Regenerates automatically when the limit of its capacity is reached.

Style SA—Equipped with a combination light and push-button switch. When this softener nears the limit of its capacity, the signal light flashes red, indicating that the switch should be turned to the automatic position for regeneration.

Semi-Automatic Supplied in three sizes.

Style SA-22—Al-

though not quite so attention-free as the Electro-Matic, this softener requires but little time. The brine tank needs refilling about three times a year; the mineral, regeneration about twice a month. Regeneration is simplified to moving a hand lever to two different positions, then returning it to its original setting.

Style SA-36 and SA-72—These operate on exactly the same principle as the SA-22. They differ only in their larger size, and the fact that steel has been substituted for heavy cast iron in the tanks.

CW-22, 36, and 72—Made in three sizes, this hand operated softener dependably supplies Crane-Warlo soft water at the lowest price.

Crane-Warlo Electro-Matic Softener

ELECTRO-MATIC
MAXIMUM FLOW RATES AND CAPACITIES
All calculations based on U. S. gallons

No.	Possible delivery of soft water in gal. per min.*	Capacity in grains of hardness removed per 100 lb. salt	Capacity in gal. per regeneration for water of 5 to 60 grains hardness										
			5	10	15	20	25	30	35	40	50	60

1702	14	170,000	3750	1850	1215	900	710	585	495	425	330	265	

*Running water pressure to softener, both 1700 and 1702 sizes—50 lb.

OTHER CRANE-WARLO DOMESTIC WATER SOFTENERS

Size	SA-22 CW-22	SA-36 CW-36	CW-72
Maximum flow rate intermittent service in gal. per minute.	10	20	33
			SA-72
			20
Hardness of water in grains per gal.	Gallons soft water per regeneration		
8	2750	4500	9000
10	2200	3600	7200
12	1833	3000	6000
14	1571	2571	5142
16	1375	2250	4500
18	1222	2000	4000
20	1100	1800	3600
22	1000	1636	3272
24	916	1500	3000
26	846	1384	2769
28	785	1285	2571
30	733	1200	2400
32	687	1125	2250
34	647	1058	2116
36	611	1000	2000

To choose the right softener for the home, multiply the number of gallons of water used every two weeks by the grains of hardness. Then consult the table and select one of similar capacity.

Typical Crane-Warlo Industrial Installation

THE DURO COMPANY

Manufacturers of Automatic, Semi-automatic and Hand Operated
Water Softeners

DAYTON, OHIO

BRANCH OFFICES AND REPRESENTATIVES IN ALL THE IMPORTANT CITIES IN THE UNITED STATES AND CANADA

Products

"DE LUXE" VITREOUS PORCELAIN CONVERTIBLE WATER SOFTENERS; VITREOUS PORCELAIN NON-CONVERTIBLE WATER SOFTENERS; GALVANIZED ARMCO IRON WATER SOFTENERS.

For Duro Shallow and Deep Well Pumps and Complete Water Systems, see Manufacturers' Index.

Easy to Install

Each type of Duro Water Softener is easy to install in any home, old or new, and wherever softened water is needed. Made in capacities to meet all requirements. The determining factor in deciding softener size is flow rate in gallons per minute rather than capacity between regenerations. Shipped completely assembled, ready to operate, making installation cost low.

SA-60 Convertible Softener

SR-60 Convertible Softener

ST-60 Convertible Softener

Model A Full Automatic
Convertible Softener

Duro "De Luxe" Convertible Softeners

This line comprises five types. The difference in each type is in the ease and convenience in which regeneration is accomplished. The semi-automatic type can be converted quickly and at little cost into either a remote control or full automatic type.

Duro Vitreous Porcelain Softeners

Similar in construction to the De Luxe line, but are not made in the remote control units. The SA is convertible to the SR. Both the De Luxe full convertible and the vitreous porcelain partially convertible softeners are made of armco ingot iron with fused vitreous porcelain coating inside and outside—non-corroding and non-rusting. All mechanism parts cadmium plated.

RG-Rapid Flow
Softener

Duro Galvanized Armco Ingot Iron Softeners

Duro Rapid Flow Galvanized Softeners are hand operated and among the most modern and efficient softeners in that field. Made of galvanized armco ingot iron, single control valve, non-leaking, easy to operate.

Note: Divide hardness into grain gallon capacity as given in column six above to obtain gallons per regeneration on each unit.

ELGIN SOFTENER CORPORATION

Water Softening and Conditioning Equipment

ELGIN, ILLINOIS

Products

ELGIN INDUSTRIAL and DOMESTIC ZEOLITE SOFTENERS.

ELGIN PRESSURE SAND FILTERS.

ELGIN DECONCENTRATORS for Boilers.

ELGIN CONTINUOUS BLOW DOWN SYSTEM with Heat Exchanger.

Also Elgin Chemical Control Equipment and Elgin Anti-corrosion Products.

Service

The ELGIN SOFTENER CORPORATION (formerly the Reiter Co.) has specialized in the field of water purification for twenty years. In addition to a thoroughly equipped laboratory, the Company maintains a staff of competent engineers to investigate industrial water problems and to survey boiler feed water problems.

Elgin Zeolite Water Softener

The Elgin Softener embodies filtration in addition to softening. The equipment, operating on the upward flow principle, produces the maximum softening capacity per regeneration with a minimum waste of wash water.

The equipment includes a filter bed at the bottom, with independent means for backwashing the filter bed, without passing the washwater through the zeolite, and during regeneration the salt solution is removed, without passing through the filter bed. The Elgin interior design overcomes one universal trouble with zeolite softeners, namely, bed blowing.

Elgin Industrial Zeolite Water Softener

The softener is complete in all details including brine tank, water meter, valve nest, softener tank and zeolite. The zeolite furnished includes either a natural or synthetic product, as required by the conditions under which the softener will operate.

The equipment is built in all sizes in both vertical and horizontal design for installation as single units or in a battery of two or more.

Elgin External Deconcentrator for Boilers

This system includes a sedimentation chamber to which is circulated the equivalent of 25% to 50% of the hourly evaporation in a boiler. Suspended matter in the boiler water settles to the bottom and the clarified water returns to the boiler.

Oil present in the boiler water collects in the sedimentation chamber, and is removed periodically by the opening of a drain valve.

The continuous circulation of the boiler water to the sedimentation chamber produces clean boiler water as the first step in the production of clean steam. In combination with correct conditioning of the feed water, blow down is materially reduced and the boiler water will not cause embrittlement, corrosion nor scale.

Elgin Zeolite-Deconcentrator Combination

Utilizing the Elgin Deconcentrator in combination with the zeolite water softener eliminates the danger of caustic embrittlement, excessive blow down and wet steam. The combination system permits by-passing a definite quantity of raw

Elgin Zeolite-Deconcentrator Combination

water which will react with the caustic soda produced by the zeolite softened water and the sludge produced will be removed by the Elgin Deconcentrator.

The zeolite softener changes the temporary hardness in the raw water to sodium bicarbonate, baking soda, which under heat and pressure within the boiler breaks down to soda ash and to sodium hydroxide. These salts are extensively used in this country for softening water, and by using a deconcentrator, raw hard water can be by-passed, utilizing these salts for softening purposes.

The combination system produces ideal boiler water at minimum operating expense, and eliminates the danger from uncontrolled caustic in the boiler water.

Elgin Lime Soda Combination

The Elgin Deconcentrator operated in combination with the lime soda softener will provide uniformly clean boiler water, reducing blow down and permitting higher overloads without the production of wet steam. Proper chemical control of the boiler water provides protection against embrittlement, corrosion and a dirty boiler.

Elgin Continuous Blow Down System

Designed for boilers where the problem is primarily soluble salts. The equipment includes an internal deconcentrator to separate the sludge in the boiler water. A single or double stage heat exchanger is used to transfer the heat units from the boiler water to the incoming feed water. The equipment can be operated as an intermittent or continuous blow down without the waste of heat units.

Elgin Continuous Blow Down System, with Deconcentrator and Heat Exchanger

The continuous blow down method is a dilution process wherein the blow down is replaced with fresh incoming feed water. It is necessary to maintain the boiler in proper chemical balance the same as with deconcentration, to secure the highest efficiency in operation.

Elgin Pressure Sand Filters

Elgin Water Filters will produce a clean water suitable for industrial uses, public buildings, swimming pools, institutions and homes. The equipment embodies the most advanced principles in design and construction and each system is tested at 50% over the maximum operating pressure.

The equipment is built in both vertical and horizontal designs, as single units or in a battery of two or more.

THE FILTRINE MANUFACTURING COMPANY

ESTABLISHED 1910

Manufacturers of Filters and Water Coolers

51-53 Lexington Avenue, BROOKLYN, N. Y.

Products

FILTERS for water (hot or cold), syrups, vegetable oils, extracts, preserving brine, etc., capacities 1 to 100 gal. per minute.

WATER COOLERS and FILTERS, combined, cooled by ice. Also ELECTRIC WATER COOLERS, small and large capacities, and CIRCULATING DRINKING WATER SYSTEMS.

Filtrine

Filtrine is the filtering material used in all "K-System" filters. This fabric contains the essential qualities of a filtering material, as specified by recognized standard authorities, here and abroad, viz.: all filtering devices must be constructed so as to allow frequent renewal of filtering bed.

Why? Because no medium can retain its purifying power indefinitely. The oftener it is changed, the more effective the filter.

Filtrine retains all suspended matter, rendering the water clean and pure. To clean the filter take out the dirty "spent" sheet and replace with new. Upkeep cost is very low.

"Filtrine" Style "A" Filter

This filter is designed to be set in the supply line, feeding a number of outlets. Filtered

and outlet, $\frac{3}{4}$ in. Weight, 20 lb.

Style "B"

Capacity, 15 to 20 gal. per minute. Weight, 100 lb. Floor space required 18x18 in. x 24 in. high. $1\frac{1}{2}$ in. inlet. $1\frac{1}{2}$ in. outlet

Especially suitable for: *Drinking water lines* in factories, hotels, office buildings, banks, theaters, etc. *Hot water lines* in private homes, apartments, etc. *For general installation* in bottling plants, laboratories, restaurants, ice-making plants, etc.

For greater capacity, filters can be mounted in multiples.

Operation—Water enters center standpipe from the bottom where the force is broken by the specially designed "baffle." From the standpipe the water works outward through the encasing cylinder of "Filtrine," depositing all the suspended matter on the surface of the filtering material, the purified water flowing off at either of the outlet valves.

Made of heavily nicked brass, valves and fittings of finest material. Tested for 75 lb. working pressure. All capacities are based on 25 lb. pressure per sq. in.

To clean, merely close inlet and outlet valves, open waste, remove top and lift out, and replace the "Filtrine." The entire replacement takes less than one minute.

"Filtrine" Style "B" Filter

Suitable for general circulating water systems in hotels, theaters, restaurants, apartment houses, department stores, and for filtering water for swimming pools, ice plants, factory and industrial use.

Installed at any point in the water service line.

Made of galvanized iron. Can be installed in batteries of two or more units with capacities up to 100 gal. per minute.

Style "B" Filter in Multiple Units—Where a large amount of water is used we manufacture multiple units of Style "B" filters.

Any number of these filters may be installed in a battery to care for a large supply of water.

They will be found very practical and will give unexcelled service in homes, hotels, schools, clubs, swimming pools, ice plants, etc.

Equally applicable to either cold or hot water supply.

Style "B" Filters in Multiple Unit

Space required for above, 2x2 ft. x 4 ft. high. Capacity, 75 to 100 gal. per minute. Weight, 500 lb.

"Filtrine" Wall Bubbler Type 5A

"Filtrine" wall bubbler takes the place of elaborate circulating drinking water system. Cooling box and filter located in one room, sanitary drinking fountain brought out in main room. Original expense and upkeep are moderate.

Steel cooling box of white enamel, dimensions according to available space (usual size 25 $\frac{1}{2}$ x11x20 in.), tinned copper lining, cork insulation; block tin cooling coil, in conjunction with cooling cell.

Style No. 1 filter. Sanitary drinking fountain furnished to suit client.

Designed for stores, banks, restaurants, theaters, offices, etc.

Typical "Filtrine" Wall Bubbler Installation

Note the absence of the unsightly, unsanitary and space wasting bottle cooler

"Filtrine" Automatic Circulating Water Cooling System

Fully automatic circulating drinking water systems with capacities up to 50 gal. per hour.

Comprising pressure storage cooling tank; automatic refrigerating machine, circulation booster pump; Style "A" filters.

Large storage cooler enclosed in heavy insulated steel container.

Cooling tank, riveted and welded.

Sizes from 4 to 75-gal. storage.

Typical "Filtrine" Water Cooling System

"Filtrine" Electric Coolers

Self-contained and remote types for offices, factories, hospitals, clubs, restaurants, featuring large reserve capacities to meet heavy peak demands.

Filters

Graver filters are made in both horizontal and vertical pressure types conforming to the standards adapted by the Associated Manufacturers of Water Purifying Equipment.

The strainer plate system is used for collecting filtered water. It is the same as that shown and described under "Zeolite Water Softener."

Batteries of two or more units with interconnecting piping are furnished where backwashing facilities are inadequate for single unit of the same capacity, or where large capacity is desired.

Complete information in Bulletin A 501.

Zeolite Water Softener

Will give zero hardness to any water. The zeolite used will regenerate as rapidly as is possible for the salt solution to flow through the bed.

The grains of zeolite are hard and have a surface softening action only, which gives a lasting softening capacity that does not decrease with age. The entire softening capacity may be utilized as rapidly as desired.

The perforated strainer plate method of collecting the softened water is used. This perforated plate is assembled in the shop and eliminates the necessity of the concrete fill required when the strainer head system is used. The strainer plate gives uniform distribution of the water with but little loss of pressure.

The softeners are built in both horizontal and vertical types.

Completely described in Bulletin A 509.

Swimming Pool Equipment

This equipment consists of filters, heater, sterilizer, pumps and motors. It is designed to keep the pool and water in a sanitary condition and, when operated correctly, will keep the pool water within the health requirements for drinking water.

The standard Graver Filters are used; sizes and specifications as listed.

In specifying, do not use a filtering rate greater than 3 gal. per sq. ft. of filter area per minute as satisfactory results can not be obtained with more rapid rates.

Accessory equipment, such as vacuum cleaner, fittings, hair catcher and coagulant equipment can be furnished.

Completely described in Bulletin A 500.

Graver Hot Process Softener

A continuous lime-soda softener that heats, softens and filters water for boiler feed purposes. It is designed solely for use in steam power plants.

It is guaranteed to produce from any water supply a feed water, containing no scale forming matter, heated to within 5° of the temperature of the incoming exhaust steam.

Cost of treatment is lower than with other methods as part of the hardness is removed by heat.

The units, consisting of heater and settling tank, pressure filter and chemical tank, are so flexible that the equipment can be installed without changes in plant layout or expensive housing and foundation.

This softener will operate satisfactorily in any boiler plant of 250 hp. or larger.

Completely described in Bulletin A 504.

Cold Process Water Softener Type "M"

This is a continuous lime-soda softener made for use by ice plants, railroads, quarries and power plants where there is no exhaust steam. It consists of settling tank, pressure filter and chemical feeding device.

It will deliver uniformly softened water at any rate of flow up to the rated capacity of the softener.

Completely described in Bulletin A 507.

Steel Plate Equipment

Tanks of all sizes from 550 gal. to 80,000 bbl. built in standard sizes and erected either in the shop or field.

Pressure tanks, stacks, flues, stills, agitators, etc., built to customers' specifications. Elevated tanks fabricated in our shops are erected by Graver men, anywhere.

Send your blue prints for quotations.

INTERNATIONAL FILTER CO.

Water Softening and Filtration Plants

59 East Van Buren Street, CHICAGO, ILL.

OFFICES IN PRINCIPAL CITIES
CANADIAN DISTRIBUTERS, GENERAL SUPPLY CO. OF CANADA, LTD. OTTAWA, TORONTO, MONTREAL

Products

WATER PURIFICATION EQUIPMENT of every type and size, for every need and purpose.

International Zeolite Softeners

Built in standard sizes, vertical and horizontal pressure types. Will meet the most exacting requirements in hotels, hospitals, office buildings, laundries, textile mills, etc., wherever a pressure softener and water of "zero" hardness is required. Furnished singly, in pairs, or in batteries of three or more units; complete with brine tank, brine control, operating valves and piping, etc.

Crystalite Softener

International zeolite is known as Crystalite, a registered trade name. Crystalite is extremely rapid in softening and regenerating actions; capable of considerable overload capacity and operation at high rates of flow. Rapid softening action is desirable in securing flexible softener operation and to permit flow rates to meet any seasonal demand for soft water. Regeneration requires under thirty minutes for all operations.

In addition to rapid action properties, Crystalite is of high exchange capacity, ranging from 8000 to 12,000 grains of hardness per cubic foot when regenerated with from 4 to 9 pounds of salt per cubic foot. Higher salt economy than 0.5 pounds per 1000 grains hardness can be obtained by reducing the salt used and exhausting the Crystalite to a lesser degree.

Crystalite is a manufactured zeolite of the gel type. As furnished for use, it is graded to proper grain size for the conditions under which it is to operate. It resembles crushed glass in appearance, and its durability or hardness may be described by the statement that the particles will scratch glass.

International Lime-Soda Softeners

Built in both the "Hot-Flow" and cold-process types; capacities 250 gallons per hour to several million gallons per day. Built in styles to conform with local operating conditions—wood, steel or concrete tank construction, ground or top operated.

Uniformity of treatment guaranteed under all conditions.

International Swimming Pool Equipment

Includes International filters and coagulant feeders with special heater, circulating pump, sterilizer, hair catcher, vacuum cleaner and pool fittings—correlated and selected to assure pure, sparkling clear water in the pool at all times. Complete equipment furnished for pools of all sizes, from the smallest plunge to extensive outdoor installations.

International Sand Filters

The pressure type is built in four styles—D, E and R with vertical steel shells and Style H with horizontal steel shells. Capacities from 170 gallons per hour to any number of million gallons per day. Filters can be used singly or in battery of two or more units. Furnished complete with wash and collecting manifold system, full charge of filtering material, all immediate pipes, valves and fittings necessary for operation, pressure coagulant feeder, pressure gauges, sampling cocks, sight glass, etc.

Recommended for filtration, under pressure, of water for industrial plants, public institutions, hospitals, office buildings, hotels, apartment buildings, bakeries, dairies and all food product plants, etc. Specially designed plants for swimming pools.

Pressure Type Sand Filter Installations

International Disk Filters

Built in four sizes, 75 to 600 gallons per hour. Used for fine filtration, being designed for putting the finishing touch of filtration on water that is already comparatively clean. Uses compressed cotton fiber disks which are discarded when clogged.

Restaurants, tea rooms, hotels, office buildings, etc., can make their drinking water most inviting by installation of the combination International Sand Filter and Disk Filter.

Sand and Disk Filter

Miscellaneous Equipment

Standard equipment to meet every problem of water purification. Gravity filter plants; mechanical filter equipment; steam-operated water stills; sterilizers; color, iron and oil removal plants, etc.

Co-operative Service

INTERNATIONAL FILTER Co. specializes in water purification for industrial, municipal and domestic purposes. We maintain a complete laboratory and staff of engineers to make reports and recommendations. This service is intended to co-operate and not conflict with the work of any representative or engineer appointed by the prospective purchaser.

Bulletins describing every type of equipment gladly sent on request.

PAIGE & JONES CHEMICAL CO.

INCORPORATED

Water Technologists
Manufacturers of Water Treating Chemicals
and Systems for Using Same

TECHNICAL DEPARTMENT AND WORKS
HAMMOND, IND.

EXECUTIVE OFFICES
461-463 Fourth Avenue, NEW YORK, N. Y.

Products

CHEMICALS and DEVICES for feeding same for treatment of boiler feed water. Chemicals for preventing pipes from rusting.

FERRIC ALUMINA, a powerful acid coagulant, for use in lime and soda water softeners.

Boiler Feed Water Treatment

The basic principle behind the Paige-Jones Method is not to counteract the scale forming salts chemically but rather by physical action to prevent their injurious crystallization in the boiler. Instead of removing the solids from the water as does a Water Softener the Paige-Jones Method impregnates the water with chemicals which act in the boiler under heat and pressure to prevent the crystallization of the substances present into hard scale. The scale-forming salts are precipitated as an easily washed out sludge.

The action of the treatment is physical rather than chemical. The ingredients of the compound are depended upon to change the nature of the deposit rather than to prevent its precipitation. With the Paige-Jones Method the scale-forming salts are rendered harmless. This treatment will not induce foaming but rather tends to counteract it. It is standard on many of the railroads and in many large industrial plants.

Method of Feeding

The chemicals are supplied in the form of round balls, weighing one pound each, prepared under high pressure. These are fed to the water supply by means of a simple feeder shown in the drawing. The feeders are charged once, twice, or three times in twenty-four hours as may be desired. The required number of balls are placed in the feeder and by adjusting the valves, they will dissolve in the required time.

Anti-rust (Formula 26)—For Preventing Rust

Paige-Jones Anti-Rust differs from boiler feed water formulæ in that it is compounded primarily to prevent rusting on hot or cold water supply lines. It is being used with much success in many large hotels, hospitals and laundries and is very satisfactory, wherever rust is troublesome.

Formula No. 26 establishes a protective coating on the inside of the piping which is constantly maintained by feeding a small quantity of the treatment directly into the supply lines. Rust is caused chiefly by oxygen-bearing water and Formula No. 26 prevents rusting by protecting the piping from the effects of oxygen. Treatment will vary from a pound to 4,000 gallons, down to a pound to 8,000 gallons, depending upon the size of the operation. Some users report that after a protective coating has been established in the piping that a pound per 15,000 gallons maintains it. It does not make water unsuitable for drinking, bathing or laundry.

There are numerous liquid preparations on the market at the present time which presumably serve as an anti-rust compound, but Formula No. 26 is more than twice as strong as the average liquid preparation. It contains no water as it is furnished in solid balls and can be uniformly applied to the water without difficulty. Each ball weighs one pound, so treatments do not need to be weighed or measured. Feeders furnished for Formula No. 26 are exactly the same as those used for the application of Boiler Feed Water Treatment.

Ferric Alumina

This is a powerful acid coagulant for improving the water from lime-soda softeners. It allows rapid clarification of the water and a low degree of hardness without the necessity of excessive alkalinity in the treated water.

PARAMOUNT WATER SOFTENER CORP.

Water Softeners, Water Filters and Green Zeolite Mineral

90 West Street, NEW YORK, N. Y.

What the Architect Should Know About Zeolite Water Softeners

The only thing an architect need know about zeolite water softeners is the size of the equipment required to meet given conditions so that sufficient floor space may be allowed for its installation.

The size of the zeolite water softener will be determined generally by the total daily and maximum hourly consumption of water and its hardness. Certain operating conditions may increase or decrease the size. Operating conditions that may affect the size of the zeolite water softener are whether or not continuous flow is required (it is necessary to shut down these softeners occasionally for regeneration) and if water storage facilities are available.

Why Greensand Zeolite Water Softeners Are Preferred

The effectiveness and economy of greensand zeolite water softeners are proven by the large number of such installations in comparison with all other methods. Some of the reasons for this are their simplicity of construction, installation and operation as well as their elimination of trouble and care. Their installation is as simple as putting in a meter or wash basin. No skilled operator is required. Any one can quickly learn to operate a greensand zeolite water softener. Greensand zeolite is not susceptible to damage or injury by freezing, drying or clogging and will soften a wide range of water. It does not deteriorate and its life is practically perpetual.

Paramount Zeolite Water Softeners

The Paramount Domestic Zeolite Water Softener is designed for installation in residences, beauty parlors, cleaning and dyeing plants as well as in small apartment houses, institutions and other places where large quantities of water are

Twin Unit Paramount Zeolite Water Softener in U. S. Veterans Hospital

Where continuous flow is required and no water storage facilities are furnished, a multiple unit softener will be necessary. Without such information the proper size of a zeolite water softener cannot be determined.

Given the foregoing information, we will gladly recommend the proper size zeolite softener.

Hard and Soft Water

The use of soft water is an economy in industry and the home. In many places it is absolutely necessary to soften water.

Hard water causes trouble in power and heating plants.

It wastes fuel, soap and other supplies and also causes extra and unnecessary work.

Zeolite water softeners are used wherever it is advantageous and necessary to soften water. They are now installed in apartment buildings, hotels, hospitals, other institutional buildings as well as in private residences and industrial plants.

The economies and advantages of the use of soft water are well established. There only remains the selection of the most practical method and equipment for softening water.

not required. It is simplicity itself. Easy to operate with no diaphragms or mechanical parts to get out of order.

For other purposes Paramount builds industrial zeolite water softeners of all sizes to meet all requirements. Railroads, hospitals, hotels, laundries, dye works and other industries as well as municipalities have found Paramount Zeolite Water Softeners economical and entirely satisfactory.

After considerable research and study Paramount has designed and proven a new design for zeolite water softeners, which size for size gives greater softening capacity, increases flow rates and reduces the quantity of wash water required. This means a smaller apparatus for given conditions requiring less floor space but, of more importance, it means more soft water at lower operating costs.

This new design permits the introduction of more greensand zeolite into the apparatus, in fact, the entire softening tank is filled with this mineral. This adds more than 25% to the capacity of the softener unit. The new screening method (Patent Pending) designed by Paramount, cannot clog and does not permit any of the mineral to escape. This eliminates the necessity of rate of flow controllers and permits greater flow rates which are only limited by the initial pressure of water supply. The reduction of the void space, due to completely filling softening unit with zeolite mineral, reduces quantity of wash water required thus reducing operating costs.

Paramount Service

In addition to supplying water softening and filtering equipment, Paramount rebuilds existing water softeners to give greater efficiency and supplies greensand zeolite mineral for refilling existing zeolite softeners.

"PERMUTIT" WATER SOFTENERS
and WATER FILTERS.

Also Other Special Water Treating Apparatus.

Permutit Zeolite Water Softeners

Consists of a steel tank containing a mineral known as zeolite. Zeolite is granular, sand-like material, insoluble in water. Water flows through the softener, and all hardness is taken out during this passage. No chemicals are used.

The zeolite is periodically regenerated by passing through it a solution of common salt. This renews its water-softening power. There are models with salt solution tanks (HS) and without them (H). Zeolite never becomes exhausted—the only material used up is salt.

Where Permutit Water Softeners Are Used

Hotels, hospitals, power plants, laundries and many other industries use Permutit Water Softeners to take all hardness out of water and fit it for some exacting service. Thousands are used in private houses supplying delightful soft water for all domestic and personal uses.

Engineering Service

Scarcely ever are the water problems of any two homes or buildings the same. Our engineering service includes free analysis of the water supply and recommendations as to the type of equipment needed.

Operation

By merely rotating the operating wheel at the top of the softener through a series of positions, the soft-

Type HS

ener is regenerated. Salt solution is stored in the tank as shown. Softeners are usually chosen of sufficient size to allow for one week's operation between regenerations.

Installation of Household Water Softeners

Softeners are usually installed in the basement as close to the street supply as convenient. Provide for carrying off the wash water by means of a sump or pipe connecting into a sink, laundry tray, etc.

Specifications for Permutit Household Softeners

Water Service—Provide and install a service line from the street main to the house meter of ample size to deliver gals. of water per minute and not less than in. diameter.

Cesspool Floor Drain—Provide and install an approved cesspool type floor drain adjacent to the softener connected to the main house drain with a in. waste pipe with sufficient fall to carry away gals. of water per minute.

Water Softener—Provide and install complete with all accessories a model Permutit Water Softener and containing not less than cu. ft. of zeolite. The softener shall have a capacity between regenerations of gals. of zero water when the water entering the softener is grains hard.

Hard Water Connections—Provide and install hard water connections to yard hydrants.

Note: Mention all other hard water outlets required.

Guarantee—The contractor shall guarantee in writing the complete installation against all structural defects that may develop within one year from date of completion. Also that, if properly operated, it will furnish completely softened water and that the water delivered will be clear and suitable for household use.

Type H

In this type—the least expensive Permutit Softener—salt required for regeneration is measured into a bucket, dissolved and automatically sucked into the softener during regeneration. Simple, it will give satisfactory service in moderate sized homes.

ROBERTS FILTER MANUFACTURING CO.

606 Columbia Avenue
DARBY, PA.

Products

ROBERTS FILTERS, FILTRATION PLANTS and FILTER APPLIANCES for every water purification requirement.

For our pages on Swimming Pool Equipment, see List of Manufacturers.

Types and Uses

Pressure type and gravity type filters, with capacities from 1 gal. per hour to 1,000,000 gal. an hour and larger.

Filters for residences, apartment houses, hotels, institutions, hospitals, swimming pools, industrial drinking water systems, mills and factories, water works and municipalities. See table below, classifying filters as to type of service.

CLASSIFICATION AS TO TYPE OF SERVICE

Type of Service	Vertical Pressure Filters								Horizontal Pressure Filters	Wood Tank Gravity Filters	Rectangular Concrete Gravity Filters
	Roberts Gravity Stone Filters	Style D	Style M	Style E	Style O	Style G	Style H	Style L			
Individual faucet use	x

Factory drinking water systems		x	x	x	x	x	x				
General industrial use				x	x	x	x				
Large industrial water supply								x			x
Town or city water works								x	x	x	x

Operation

Water enters filter at top, passing downward through the filter bed, collects in strainer system at bottom and discharges through outlet.

Filter bed consists of specially graded pure silica sand, resting on graded silica gravel. In some cases quartz, marble, or refined bone charcoal are employed. Attached to inlet line of filter there may be (and usually is) employed a Roberts automatic coagulant feeder, which accurately feeds a slight quantity of alum into the raw water.

In all vertical pressure filters, except Styles "H" and "L," the entire operation is governed by the Roberts single control valve.

Roberts Single Control Valve

Cleaning of all Roberts filters is thoroughly and easily accomplished by a reverse flow of water, which lifts and "liquefies" the sand bed, scouring it on itself and flushing the removed matter to the sewer.

A sight glass on the waste line indicates when the washing is complete.

Roberts Style "D" Filter

The model household filter. Cast iron construction. Equipped with coagulant feeder, single control valve, sight glass. Also has agitator, operated by hand wheel, which is used during washing to assist in breaking up the filter bed.

Made in 12, 16 and 20-in. sizes.

Style "D" Filter

Roberts Style "M" Filter

Widely used in residences of the better class. Consists of two cast iron filters, connected in tandem for double filtration. First cylinder charged with sand and ground marble; second cylinder with refined bone charcoal. First cylinder removes suspended matter; second cylinder reduces or removes odor, taste and color. Equipped with single control valves, sight glass and coagulant feeder.

Made in 12, 16 and 20-in. sizes.

Style "M" Filter

Roberts Style "E" Filter

Cast iron construction—in sections. Can readily be taken through small doorways. Equipped with coagulant feeder, single control valve and sight glass. Filling and inspection hole (4 in.) in top; larger sizes also have standard manhole in each shell section. (See illustration Style "O.") Pleasing appearance; substantial in looks and in fact.

Made in 8 sizes, 12 to 50 in.

Style "E" Filter

Roberts Style "O" Filter

Consists of two Style "E" filters connected *in tandem* for double filtration. Principle similar to Style "M," but larger units. Two Style "G," or Style "H" units may also be connected up as a double filter. Specially adapted for waters containing dissolved color, taste and odor.

Made in 5 sizes, 24 to 50 in.

Style "O" Filter

Roberts Style "G" Filter

Steel construction; top head bumped convex, bottom head concave. Equipment and connections similar to Style "E." Hand-hole in top, manhole in shell. Made in 5 sizes, 30 to 60 in.

Style "G" Filter

Roberts Style "H" Filter

Same as Style "G," except single control valve omitted. Operation controlled by 5 gate valves. Made in 5 sizes, 30 to 60 in. Connections as illustrated on Style "L."

Roberts Style "L" Filter

Steel construction; both heads bumped convex. Filtered water collector system consists of central manifold and laterals of the perforated pipe type. Equipped with gate valve control, coagulant feeder and waste funnel. Manhole in top head.

Made in 66, 72, 78, 84 and 96-in. sizes.

Style "L" Filter

*See "Notes on Specifications."

†Special or oversize connections can be furnished.

Notes on Specifications

Specify filters by *inside diameter*. If diameter is not specified, the term "capacity" is meaningless unless accompanied by the following "at a unit rate of filtration not exceeding ... gal. per min. per sq. ft. of effective cross-sectional filter area." Example: A 42-in. (inside diameter) filter has an area of 9.62 sq. ft. (42-in. circle) and at a unit rate of 4 has a capacity of 38.48 gal. per min.; while at a unit rate of 3, capacity is 28.86 gal. per min.

The *unit rate* of filtration that may be safely employed in a given case is determined by two factors: (a) the character of the raw water, and (b) the quality of filtered water desired. When bacterial efficiency and complete clarification are desired, a 2-gal. unit rate is the maximum. For clarification of a turbid water use a 2-gal. unit rate; of a slightly turbid water, a 3-gal. unit rate; and of a good water (such as New York City) a 4 or 5-gal. unit rate. For recirculating *swimming pools* the standard unit rate is 3. *No unit rate in excess of 5 gal. should ever be employed.*

In filter practice, the accepted meaning of clarification is the removal of practically all suspended matter visible to the naked eye, rendering the water bright, clear and sparkling.

Capacity of a double filter (two cylinders in *tandem*) is that of a single filter of same diameter cylinder.

Always specify maximum pressure to which filters will be subjected in operation.

Roberts standard cast iron filters are built for a working pressure of 60 lbs. and tested to 100 lbs.; steel filters are for working pressure of 60 or 100 lbs. and subjected to a test 50% in excess of working pressure.

Filters for higher pressures supplied, where required.

Other Styles

We manufacture Roberts stone filters for individual faucet use. Over 500,000 in use. Capacities 1 to 60 gal. per hour. Prices \$5.00 to \$70.00. Catalogue on request.

Horizontal pressure filters, wood tank gravity filters and rectangular concrete gravity filters for large installations. Complete information upon application.

Send for bulletins or, if more convenient, see SWEET'S ENGINEERING CATALOGUE for data on larger sizes.

General

Roberts equipment is being used satisfactorily for domestic, industrial and municipal installations. The pure, clear and sparkling water delivered at all times is convincing proof of its efficiency.

More than 900,000,000 gal. of water are being satisfactorily treated daily by Roberts filters.

Strength and durability are two of their main characteristics.

Also Refinite Rapid Pressure Filters.

Refinite Rapid Zeolite

Refinite Zeolite (a natural product) has high capacity, long life, does not dissolve, wash from the container nor contain ferrous oxide (iron rust).

Refinite Zeolite is adaptable to any type of softener. When used in softeners of other makes will greatly increase capacity. Write us for the names of 100 or more institutions which have made this change.

Our Rapid Regenerator is a marked improvement. Can be placed at remote points, even on the floor above or floor below the softener, where convenient to salt storage.

The Clinic and the Hotel Kahler, Rochester, Minn.

Two 96-in. Refinite Softeners installed in this plant at Rochester, Minn., to soften hot water from turbine condensers, effecting a great saving in heat units. Refinite Zeolite is the only mineral that will soften hot water. This is proof it will last almost indefinitely softening cold water.

Refinite Water Softeners

Refinite Water Softeners deliver a large quantity of soft water per regeneration. Guaranteed exchange capacity 80 grains per pound of mineral. Many installations are actually delivering 100 to 120 grains per pound of mineral.

Refinite Softeners are equipped with the exacting and rigid "standard soap test" as prescribed by the American Public Health Association.

Three 96-in. Water Softeners

The three 96-in. water softeners illustrated above are regenerated with one Refinite Rapid Regenerator 24 in. in diameter, placed in the salt room, 30 ft. distant from these softeners.

The Refinite Rapid Regenerator replaced an old style brine tank that occupied 114 sq. ft. of valuable floor space.

Specifications for Industrial Water Softener

Capacity—Furnish and install a water softener having a capacity for . . . gallons per each regeneration when softening water of . . . grains hardness.

Regeneration—The softener must be of the Rapid regenerating type and so constructed that a complete regeneration can be made within 40 minutes' time. The softener shall be designed so that not to exceed 30 gal. of raw makeup water will be required to dissolve salt and to transfer sodium to softener.

Softener Tank Construction—The tank shall be of heavy riveted construction and tested for 100 lb. working pressure.

Meter—The meter shall be of the bell alarm type and connected so that a bell will ring when the softener has reached its rated capacity.

Samples and Information

THE REFINITE COMPANY will be glad to send samples of Refinite Mineral and architect's A.I.A. File 29d32 upon request.

Refinite Domestic Water Softeners

Refinite Domestic Water Softeners are made in sizes suitable for every home.

They are the lowest in price when quality and construction are considered.

Prices range from \$100.00 up.

The most popular size is the D-18, which sells for \$195.00 f.o.b. factory.

This softener is nearly 100% automatic in operation.

It is equipped with our single lever monotrol

valve, making it extremely simple to operate.

We have avoided the use of any complicated collection of gears, cams, wheels, motors, magnets and diaphragms which would entail frequent and expensive repairs by factory experts.

Refinite does not produce rusty water.

The table shows prices and capacities of our domestic softeners.

Products

WATER FILTERS (Gravity and Pressure) for industrial uses, municipalities, public buildings, swimming pools and residences.

WATER SOFTENERS for boiler feed, residences and industrial uses.

Pressure Filters

Pressure filters are designed to operate with water under pressure. They are built of steel plate in vertical sizes to 120 in. in diameter. For larger capacities they

Single Vertical Pressure Filter

are built horizontally to 25 ft. long. Unsurpassed for office buildings, swimming pools and industrial plants.

Zeolite Softening System

Designed to remove lime and magnesia hardness to zero by soap test. Heavy, durable mineral that gives clear, soft water immediately after regeneration. Auto-

Scaife Zeolite System

matic salt dissolving, measuring and introducing device. Especially adapted for hotel, office building, hospital, textile and laundry use.

DAVIS ENGINEERING CORP.

Manufacturers of Paracoil Water Storage Heaters and Other Heat Exchangers,
Steam Traps, Steam Specialties

90 West Street
NEW YORK, N. Y.

FACTORY: ELIZABETH, N. J.

CABLE ADDRESS
"PARACOIL, NEW YORK"

Products

STORAGE and INSTANTANEOUS WATER HEATERS.

Also Steam Traps, Feed Water Heaters, Feed Water Filters and Grease Extractors, Oil Heaters, Evaporators, Exhaust Gas-steam Generators, Oil Coolers, Distillers.

Paracoil Storage Water Heater

For heating and storing hot water for laundries, factories, hospitals, etc. Has steel plate shell for water and copper heating coils for steam. Pressures 100 lb. standard and up. Sizes, 200 to 20,000 gal. per hour, heated to 180° F. These heaters can be arranged for below boiler water line service as submerged type described below.

Paracoil Storage Water Heater

Paracoil Submerged Type Storage Water Heater— for 1 to 10 Family Jobs

This submerged Paracoil Storage Water Heater, designed especially for the private residence and small apartment house, gives users the same hot water service (only on a smaller scale) that is derived from the large Paracoil storage units, which are in use in many of the world's largest buildings. Write for bulletin giving capacities, piping diagrams, etc.

Among the advantages of this self-contained unit over the separate tank and heater system are:

Clogging of circulating

Paracoil Submerged Type
Connected to Hot Water
Boiler

Paracoil Submerged Type Con-
nected Below Water Line
of Steam Boiler

Paracoil Instantaneous Water Heater, U-Tube Tank Heater, Preheater and Condensation Cooler

Ideal for apartment houses, hotels, etc. Connected below water level of boiler, heats water supply when fire is banked.

Unexcelled for indirect heating of private garages and conservatories.

Capacities from 350 to 12,500 gal. or more, as required.

Paracoil Instantaneous Water Heater

DIMENSIONS PARACOIL INSTANTANEOUS WATER HEATER

Products

WATER STORAGE HEATERS (Bulletin No. 65); INSTANTANEOUS WATER HEATER (Bulletin No. 55); FEED WATER HEATERS (Bulletin No. 51A, 53); COAL BURNING TANK HEATERS (Bulletin No. 52A).

Also Coils, Pipe and Tube (Bulletin No. 60), Caustic Liquid Heaters (designed to suit service), Fuel Oil Heaters (designed to suit service).

National Hot Water Heaters

We make hot water heating units of two types, storage and instantaneous. Each type has its advantages and the installation depends upon the hot water demand. For either exhaust or live steam.

Single and Double Element Storage Heaters

A combination of a closed pressure vessel and a steam tube heating element. For use under conditions where the instantaneous demand for hot water exceeds the immediate steam supply. A properly proportioned hot water storage heater will insure ample hot water without increased boiler capacity in many instances.

Single Element Steel Shell Horizontal Storage Heater

Made in horizontal and vertical type to supply from 100 to 15,000 gal. of hot water per hour, heated through standard temperature range 50° to 180° F., with steam under pressures from 0 to 100 lb. gauge.

Standard diameters and storage capacity:

Shell diameter.....in.	36	42	48	54	60	72	84	96	108
Gals. per ft. of length...	52	72	95	131	142	215	282	366	462

Hourly Heating Capacities—These capacities depend upon water temperature required and available steam pressure. Heating elements can be furnished to meet any requirements. Relative heating values to steam under different steam pressures are as follows:

Steam pressure.....lb.	0	2	5	10	20	30	50	75	100
Ratio.....	1	1.09	1.22	1.39	1.67	1.87	2.18	2.47	2.70

Double Element Steel Shell Horizontal Storage Heater

Instantaneous Type

Heats water as it flows either continuously or intermittently. Built for steam pressures up to 75 lb. per sq. in.

U-bend copper tubes through which the water passes are fitted into a cast iron or steel shell through which the steam for heating is passed. Made in sizes from 210 to 12,000 gal. of hot water per hour at temperatures from 40° to 180° F.

Instantaneous Process Water Heater

Feed Water Heaters

National Feed Water Heaters are made up of a cast iron, wrought iron or steel shell containing one or more helical coils of seamless copper tubing. The water is pumped through the coils absorbing heat from the exhaust steam in the shell.

These heaters are made in sizes to provide for heating the feed water for a wide range of boiler sizes and invariably show large savings of fuel.

Copper Coil Coal Burning Tank Heaters, Automatic

The National "Multi-Flow" is ideal for hot water supply for domestic use, restaurants, beauty parlors, apartments, small hotels, country clubs, etc., and is adaptable for heating small bungalows, garages, sun porches, etc.

Construction—The high grade construction of the National insures long life and continuous service. Jacket is extra heavy gauge iron, with red vitreous enamel finish, top and base high grade gray iron.

Large double wound copper coils with brazed seamless manifolds.

Coils tested to 600 lb. pressure will stand up under any city water pressure.

Fire brick combustion chamber, triangular grates, and lift drafts.

Tank Capacities in Gallons—No. 12, 125 gal.; No. 16, 250 gal.; No. 20, 450 gal.

No. 12

EXCELSON WATER HEATERS

KLEARWAY VALVES

MADE BY
EXCELSON PRODUCTS CORP.

65 Clyde Avenue
BUFFALO, N. Y.

BRANCHES IN ALL PRINCIPAL CITIES

Products

EXCELSON INDIRECT and DIRECT WATER HEATERS which replace the fire pot coils and permit the effective utilization of the boiler and furnace fire for the heating of the domestic hot water supply. In any size building from a cottage to large apartments, hotels, office buildings and factories, Excelson Heaters will provide a constant, uniform hot water supply for all tap needs at practically no cost. Excelson Water Heaters are self-operating and require absolutely no attention. They are easily and quickly installed in new buildings or old, by any plumber or steamfitter.

Excelson Heaters are also used extensively for heating hot water radiation.

Excelson Water Heaters are made in two types: *Indirect*, for use with steam or vapor heating plants, and *direct*, for use with hot water or warm air systems.

Excelson Klearway Valve—A simplified two-way cleaning valve for hot water supply or heating systems. It eliminates several valves usually installed.

Excelson Indirect Heaters

How Used—Excelson Indirect Heaters are attached between the steam or vapor boiler and the hot water storage tank, as shown in the illustration. Water from the heating boiler flows around the copper coils in the heater, in turn heating the domestic water supply which circulates inside the coils and into the storage tank. The tank is always full of piping hot water as long as the boiler is being fired.

Special Features—The Heater itself is made up of a heavy, self-draining cast iron shell, with removable cover plate and a heavy duty removable copper coil with patented ground joint brass connections, an exclusive Excelson feature. The use of this special type of connection eliminates the necessity for gaskets, thus doing away with the chief cause of leaking found in many heaters after a few years' use. The water being heated comes in contact only with the copper coil and the patented ground joint brass connections. It remains free and uncontaminated by rust, dirt or sediment.

Where Used—Excelson Indirect Heaters can be used in any type or size of building where there is a steam or vapor heating plant. There are over 700,000 of them in use today in all parts of the United States and Canada. It has been proven conclusively that practically no building is too large to have its domestic hot water needs efficiently cared for by one or more Excelson Indirect Heaters. They are in use today in twenty and thirty-story buildings, in apartment hotels housing several hundred families, in buildings covering entire city blocks. In every case, the water is always piping hot, even at the outlets located the farthest away from the heater.

EXCELSON

WATER HEATERS

Excelson Indirect Heaters operate equally satisfactorily on any type of steam or vapor boiler, new or old, whether cast iron or steel, sectional or round, plain or jacketed.

Practically No Operating Cost—A careful check-up of thousands of Excelson Indirect Heater installations throughout the country indicates that Excelson provides hot water at practically no operating cost.

A Size for Every Need—Excelson Indirect Heaters are made in four types and seventeen sizes, providing heating capacities for tanks ranging from 30 to 2000 gal. Unlimited capacities can be provided for by the installation of two or more Excelson Heaters in battery.

Other Uses—Excelson Heaters are used extensively for heating radiation, warming sprinkler tanks, swimming pools, and heating open vats and tanks.

Typical Excelson Indirect Water Heater Installation With New Excelson Klearway Valve

This illustration shows an Excelson Indirect Water Heater installed with the new Excelson Klearway Valve.

The simple operation of the valve on an Excelson or other hot water heater installation effectively cleans rust and sediment from the system. It offers a new safety feature, as with it the circuit is never blocked. It can be installed on high temperature systems without the hazard which results if gate valves are used and accidentally left closed.

EXCELSCO INDIRECT WATER HEATERS

**Excelso Single Coil Indirect Heaters**

Made in seven sizes, with capacities of from 30 to 140 gal., to care for small and medium size residences. Single coil heaters are equipped with two fine quality brass unions as well as removable copper coils and the Excelso patented ground joint brass connections.

**Excelso Double Coil Indirect Heaters**

Made in four sizes, with capacities of from 160 to 420 gal., intended for installation in small apartments, stores, large residences, etc. Excelso single and double coil Grey heaters are used extensively for preheating heavy grades of oil—improves combustion and economy. Special corrosion resisting coil used.

**Excelso Triple Coil Indirect Heaters**

Made in three sizes, with capacities of from 600 to 1000 gal., designed especially for large apartments, small hotels, hospitals, garages, etc. Heaters may be used singly or in batteries of two or more. Large diameter tubing in coils assures full flow through all copper and brass waterways.

**Excelso Dual Coil Indirect Heaters**

Made in three sizes of from 1200 to 2000 gal. capacity, designed to heat water in very large apartments, hospitals, hotels, swimming pools, auto washing stations—in fact, Dual Coil Excelsos will furnish practically any quantity of hot water desired, as they may be installed singly or in batteries of two or more.

EXCELSCO DIRECT WATER HEATERS

Excelso Fire Pot Generator

Installed above the fire level in hot water boilers and warm air furnaces. It does not interfere with combustion or fuel or with firing the furnace. Its design gives maximum broad heating surface. It is available in either cast iron, brass or galvanized iron in two sizes: No. 1, capacity up to 40 gal.; No. 2, capacity up to 60 gal.

**Excelso Phaeton Heater**

Intended for heating the domestic hot water supply or auxiliary radiators, or both. They are placed in the furnace or hot water boiler, above and out of the way of the fire. Made of cast iron, brass and galvanized iron in six sizes ranging from 30 to 250 gal. capacity for water heating and from 40 to 400 sq. ft. of hot water radiation.

**Excelso Fin Pin Heaters**

Installed directly into the bed of the fire. The fins on the side of the heater prevent clinkers forming around the unit and allow air passage which prevents deadening of the fire so common where pipe coils are installed directly into the fire. Made in cast iron, brass and galvanized iron in 30 and 40 gal. tank capacities.

**Dealers and Stock**

Sold and installed by plumbers and steamfitters everywhere.

THE PATTERSON-KELLEY CO.

Water Heating Engineers and Manufacturers of Hot Water Heaters

102 Park Avenue
NEW YORK, N. Y.

BRANCH OFFICES IN PRINCIPAL CITIES

Products

PATTERSON HOT WATER SERVICE HEATERS: STORAGE and INSTANTANEOUS TYPES.

Also manufacturers of Converters for hot water heating systems; Swimming Pool Heaters; Preheaters or Condensation Coolers; Reclaimers for recovering heat from waste liquids; Feed Water Heaters and Purifiers; Fuel Oil Heaters; Kelley Hot Water System for Laundries.

Co-operative Engineering Service

Architects place themselves under no obligation by permitting Patterson-Kelley Engineers to submit suggestions regarding heaters required for specified purposes. We offer such service without charge and, when an installation is made in accordance with our recommendation, we positively guarantee that it will furnish all of the hot water required, as hot as required and when required.

General Construction

The tubes in all Patterson Hot Water Heaters, Types A, B, C, D, E, F, G and L, are of heavy gauge, seamless drawn copper, tested to 1000-lb. hydrostatic pressure per sq. in. All tube heads are forged steel. The shells are either boiler plate or best quality dry sand castings of ample thickness. After assembling, each heater is tested to a hydrostatic pressure 50% greater than the specified working pressure.

Guarantee

We guarantee the materials and workmanship of each heater to be first class in every respect, and any part proving defective within one year from date of shipment will be replaced without charge. We also guarantee each heater to heat its rated capacity of water.

Patterson Combined Hot Water Service and Storage Heaters

Both the Type B, horizontal, and Type L, vertical, provide any combination of storage and heating capacities. They require only a small continuous supply of steam to heat and store sufficient water for peak load periods.

The tubes are "U" shaped seamless copper, both ends of each tube being expanded in a forged steel removable tube head. The shells are of steel and, if desired, may be coated inside with rust resistant or lined with copper so that water comes in contact with no metal other than copper, thus combining the strength of steel with the durability of copper.

Type B

Suggested Specifications for Type B Heaters—

Furnish and install, where shown on drawing, one Type B Patterson (or equally approved) Combined Hot Water Heater and Storage Tank, with No. S storage section and No. H heating section.

The heating surface to consist of "U" shaped seamless copper tubes, both ends of each tube to be expanded in a forged steel tube head, and to be of sufficient capacity to heat not less than

.... gallons of water per hour from an initial temperature of degrees to a final temperature of degrees when supplied with steam at pounds pressure.

The heater to be furnished with manhole, all necessary openings, tappings, and saddles for its support.

The water space to be tested for a working pressure of pounds per square inch and the steam space for a working pressure of pounds per square inch.

PATTERSON COMBINED HOT WATER SERVICE AND STORAGE HEATER TYPE B

Storage capacities				Heating capacities 40° F. to 180° F.—steam at atmospheric pressure

Note—To specify Type B heaters, combine the numbers of the required storage and heating capacities. For example, "One Patterson Type B heater with No.22S. and No. 17H." has 1000 gal. storage with 3000 gal. hourly heating capacity.

Patterson Instantaneous Hot Water Service Heater

This is a water tube heater, with only nominal storage capacity. It is recommended for use where the hot water demand is practically continuous or as a hot water generator for circulating systems.

Instantaneous Heater Type D

"Data Book for Architects' and Engineers' Use"

Send for this. It contains accurate capacity tables of the herein described and other types of Patterson Service Heaters and Generators.

Gallons of water per hour are given for each size, at various final temperatures, using steam at different pressures. Detailed dimensions are shown of all sizes; also capacities of Patterson Converters in square feet of radiation, etc.

TACO HEATERS, INCORPORATED

Manufacturers of Indirect Water Heaters

342 Madison Avenue, NEW YORK, N. Y.

Taco for Constant, Economical Hot Water Supply with Any Type Heating Plant

Taco *Indirect* Hot Water Heaters are furnished in three styles for use with steam and hot water heating plants. They will provide up to 5000 gal. of hot water (based on 100° temperature rise in three hours) for every domestic need.

Taco Universal *Direct* Hot Water Heaters are for round hot water heating boilers for supply tanks up to 60 gal. capacity.

Taco Heaters, as shown in the detail for each heater, will operate successfully with oil burning systems, and in combination with automatic gas hot water supply heaters as preheaters.

Taco Indirect Heaters Embody Correct Operating Principles and Are All Guaranteed

The Taco Indirect Water Heater is hooked up to a steam or hot water heating boiler. Hot water from the boiler circulates within the shell of the Taco Heater and surrounds a copper coil through which the storage tank water flows. Heat is transferred to the storage tank water at all times while the heating boiler is in operation and with a suitable size Taco properly installed, an abundant supply of clean, hot water is assured.

Factors Which Determine the Proper Selection and Installation of Taco Heaters

In selecting the size of Taco for a given installation, consideration must be given to a number of factors. The catalogue ratings are based on 100° temperature rise in three hours, and the capacity in gallons given in the tables is usually considered also to be the capacity of the storage tank which the heater will serve. It is well to understand that these rated capacities of the Taco were obtained operating under favorable conditions and with the boiler steaming. It

TACO

is good practice to allow a margin when selecting Tacos of the proper size to provide for loss of efficiency due to fouling; also to allow a margin for increased future demands for hot water. In other words, to select the larger sized Taco for consistently satisfactory hot water supply, particularly in mild weather when boiler fire is often banked for hours at a time. Other factors which have a bearing on the selection of the proper size Taco are:

Location of Storage Tank—Tank should be placed as high as possible. Storage tanks of 18 in. diameter and over should be horizontal, with bottom on or above the water line of the boiler.

Losses by Radiation—It is obvious that if there is an extensive circulating system used in connection with the domestic hot water supply, comprising long runs of uncovered piping, that radiation loss from this piping should be given consideration by increasing the size of the Taco.

Pipe Sizes—Pipes should be full size of the heater openings. This is particularly important in connection with the pipe that connects the Taco to the boiler. If brass pipe is used between the Taco and storage tank, it may be one size less than the Taco opening. The use of brass pipe for this service is increasing and is strongly recommended.

Drains for Heaters—Valves and drains are absolutely necessary to permit flushing out the shell and coil of the heater at regular intervals.

Gas or Oil Fired Boilers—Where oil or gas is used for fuel it is fired intermittently. This means that in mild weather there may be a fire in the boiler for only one or two hours a day. It has been frequently found that installations that were entirely satisfactory with coal as a fuel, have been less so when a change was made to oil. The remedy has in all cases been a larger Taco, larger storage tank, or both. For "summer hot water" installation, see Figs. 14 and 14-A.

Fig. 14-A

TACO INSTALLATION YEAR ROUND DOMESTIC HOT WATER SUPPLY, TACO-ABBOTT SYSTEM

For detail installations see following pages

Patent No. 1654396

Taco Installations

For Year Around Domestic Hot Water Supply with Oil Burner

Taco-Abbott System. Patent No. 1,654,396. Automatically Controlled

Taco-Abbott System provides for automatic year round domestic hot water supply from an oil-fired steam heating boiler. This system offers many advantages to the home owner and the oil burner dealer alike. By keeping the boiler in service the year round, the boiler and oil burner are always in perfect condition. The slight heat radiated from the equipment keeps the cellar dry. No other water heater is needed and the cost of summer operation is so small as to be negligible. *There are no valves or switches to be operated.*

This system can be installed in connection with a cast-iron sectional boiler with each section tapped and headed together just below the water line. Tapping the boiler in this manner not only permits the free circulation of the boiler water to the Taco from all sections of the boiler, but *prevents the boiler from steaming during the summer months* when heat is not required in the radiators. With steel boilers and round cast-iron boilers no header as above described is required.

A boiler water temperature control is set to automatically maintain a minimum water temperature in the boiler at all times of about 170 to 180 degrees F.

This patented system is offered to you exclusively by Taco Heaters, Incorporated.

Due to the intermittent operation of the oil burner and the fact that the boiler water is maintained at only 170 to 180 degrees during mild weather and during the summer months, larger Tacos are required than when the boiler is coal-fired and used during the heating season only.

Special circulars and detailed piping diagrams are available upon application for all types of installations.

Table on following page lists the recommended sizes of Tacos, Storage Tanks and Pipe Sizes for use with Taco-Abbott System.

There are given a number of typical installation drawings. Larger scale drawings similar to these will be furnished upon request, also installation drawing for any installation not covered by these drawings.

Whitlock Type K Horizontal Storage Heaters

For Use with Live or Exhaust Steam

Whitlock Type K Storage Heaters are used wherever large quantities of hot water are required at irregular intervals. By using a small amount of steam steadily, sufficient heat is stored to supply ample hot water for peak requirements with a steady load on the steam boiler. Hotels, apartment houses, office buildings, schools, hospitals, laundries, textile mills and other buildings have obtained their hot water supply from these heaters for many years.

Fig. 1. Type K Horizontal Storage Heater

Construction

Shell—Steel plate, to A.S.T.M. Specifications 78-27, firmly riveted. The bumped heads are not the conventional type, but are curved to the contour of a semi-ellipsoid, by means of knuckle radii which are from 4 to 8 times as great as required by the A.S.M.E. Unfired Pressure Vessels Code.

Heating Section—Heavy gauge, seamless copper U-bends, removable as a unit for cleaning and inspection.

Tube Sheet—Heavy rolled steel.

Tube Support—Rolled or cast bronze.

Head or Steam Chamber—Best commercial grade cast iron.

Manhole—11x15-in. manhole with double yoke on heaters of 30-in. diameter or greater; 6x8-in. handholes on smaller diameter heaters.

Note: This standard construction may be varied to meet unusual operating conditions.

Test

Before shipment, every heater is subjected to a hydrostatic test pressure as required by the laws of the State in which it is to be installed—with a minimum of 50% in excess of the working water pressure specified. A test certificate is sent to the customer.

Selecting the Proper Size of Heater

Consultation with Whitlock Engineer on Heater Requirements Recommended—We strongly recommend the practice of many architects and engineers in calling in the nearest Whitlock Engineer for suggestions or recommendations as to the best type and

proper size of water heater for given installation—see last paragraph on the fourth following page. However, where this is impossible, the following tables will enable the architect or engineer to select a heater to fit the requirements of the majority of cases, if proper attention is given to all of the conditions.

Referring to Table I, list the various fixtures of each kind, and their capacities as shown opposite the fixture for the particular type of building in question. Add these capacities together and the probable average hourly requirement equals hourly requirement, as found, multiplied by the heating capacity factor in the table.

TABLE I. HOT WATER FIXTURE CAPACITIES FOR VARIOUS TYPES OF BUILDINGS

Figured at a final temp. of 180° F.

Type of fixture	Gal. of water per hour per fixture									
	Apartment house	Club	Gymnasium	Hospital	Hotel	Industrial plant	Office building	Public bath	Private residence	School
Basins—										
Private lavatory...	2	2	2	2	2	2	2	2	2	2
Public lavatory...	4	6	8	6	8	12	6	12	15	8
Bathtubs...	20	20	30	20	30	30	45	20	15	30
Dishwashers...	15	30	30	30	30	12	15	3	3	12
Foot basins...	3	3	12	3	3	12	10	10	10	20
Kitchen sinks...	10	20	20	20	20	20	20	20	20	20
Laundry station-										
ary tubs...	20	28	28	28	28	28	28	28	28	28
Pantry sink...	5	10	10	10	10	225	225	75	225	225
Showers...	75	150	225	75	75	20	15	15	15	20
Slop sinks...	20	20	20	20	20	20	20	20	20	20
Hourly heating capacity factor percentage	20	30	40	25	25	40	25	50	30	40
Storage capacity factor percentage	80	90	100	60	80	100	200	120	70	100

To illustrate the above method of selecting the proper heater, we will take the hot water requirements of a small hotel as follows:

Private lavatories.....100 @ 2 gals. each 200 gals. per hr.
Public lavatories.....10 @ 8 gals. each 80 gals. per hr.
Bathtubs.....75 @ 20 gals. each 1500 gals. per hr.
Dishwashers.....2 @ 30 gals. each 60 gals. per hr.
Kitchen sinks.....3 @ 20 gals. each 60 gals. per hr.
Pantry sinks.....3 @ 10 gals. each 30 gals. per hr.
Showers.....24 @ 75 gals. each 1800 gals. per hr.
Slop sinks.....9 @ 30 gals. each 270 gals. per hr.
Hourly requirements (total).....4000 gals. per hr.

Hourly heating capacity equals 4000 multiplied by 25%, or 1000 gal. per hour.
Storage capacity equals 1000 multiplied by 80%, or 800 gal.

Nearest shell size to 800 gal. is 860, No. 16 (42x144 in.).
Heating section of 1000-gal. capacity is No. H13.
Heater required is then "Whitlock Type K No. 16H13."

Table II will now give the proper size shell and heating section of the Type K heater and the principal dimensions to assist in the layout. Note particularly in combining shell size and heating section the column in

Table II showing the "Minimum size shell section will fit" and see that the heating section chosen is not too large for the shell.

Table II lists shell and head thicknesses which we recommend for usual working pressures to insure a long life to the heater.

Table III (on following page) should be consulted to be sure that the heater selected is heavy enough for the particular working water pressure to which it will be subjected.

Type K Vertical Storage Heaters for Use Where Space Is Limited

All of the previous material has related primarily to the more common horizontal storage heaters.

Space requirements at times make it more desirable to install a vertical heater.

The Type K Vertical Heater shown in Fig. 3 is designed especially for these conditions with the heating section low in the shell and supported on pipe legs and side brackets.

This type of heater is made in the same standard sizes of shells and heating capacities as the Type K horizontal heater.

Type K Combination Live and Exhaust Steam Horizontal Storage Heater

The Combination Type K is provided with two heating sections as shown in Fig. 4. In this case the primary section uses what exhaust steam, drips or condensation returns are available and the auxiliary section uses live steam, under thermostatic control, to complete the heating required.

The specifications, in the next column, are written so that these alternate types of heaters may be substituted, but where possible we urge the architect or engineer to consult a Whitlock Engineer (or write us the details) as a few other factors enter into this problem which can not be entirely covered in these pages.

Installation Diagrams, etc.

We will be glad to co-operate with any architect or engineer in furnishing additional information as to the construction and materials used in these heaters, or furnish typical installation drawings.

Bulletin No. 40-SA, containing complete information on Type K Heaters, sent on request

Whitlock Instantaneous Heaters

Uses

Whitlock Instantaneous Heaters are made in several different types for a variety of uses.

With Storage Tank—An instantaneous heater may be used to supply hot water to a storage tank by either gravity or forced circulation.

Swimming Pool Heater—Heating a large quantity of water through a small temperature range. It is customary to figure on heating the contents of the pool in from 10 to 12 hours.

Specification for Whitlock Type K Storage Heater

Option 1—Furnish and install as shown on the plans, one Whitlock Type K Storage Heater No. H

Option 2—Furnish and install in [horizontal] [vertical] position as shown on plans, one Whitlock Type K Storage Heater as manufactured by THE WHITLOCK COIL PIPE COMPANY, Hartford, Conn.

Capacity—The heater shall have a storage capacity of gals. The shell shall be in. in diameter by in. long (shell thickness in.; head thickness in. suitably riveted to stand a working water pressure of lbs.).

*The heater shall be capable of heating gal. of water per hour from 40° F. to 180° F. when supplied with sufficient steam at lb. gauge pressure.

Construction—The shell shall be constructed of steel plate to A.S.T.M. Specifications 78-27, with riveted seams properly designed for specified working pressure.

Necessary connections of sizes recommended and guaranteed by the heater manufacturer for specified duty and 11x15-in. manhole shall be provided.

Heating Section—The heating section shall consist of seamless drawn copper tubing made up into U-bends with ends expanded into a rolled steel tube sheet. The heating section shall be properly supported in the shell of the heater, shall be easily accessible and arranged so that the entire section can be easily removed from the shell for cleaning or inspection.

The steam distributing chamber or head, baffle at steam inlet connection, and supporting cradles (if horizontal type heater) shall be of the best grade commercial cast iron.

Test—Before shipment, shell and heating section shall be submitted to a hydrostatic test pressure as required by the laws of the State in which heater is to be installed—with a minimum test pressure of 50% in excess of the working pressure specified.

*Note: When the combination Type K heater is required, substitute the following paragraph in the above specifications:

The heater shall be capable of heating gal. of water per hour from 40° F. to 180° F. when the primary heating section is supplied with lb. of exhaust steam or condensate at a temperature of ...° F. and the auxiliary heating section is supplied with steam at lb. gauge pressure under control of an automatic temperature regulator of approved design.

Fig. 3. Type K Vertical Storage Heater

Fig. 4. Type K Combination Live and Exhaust Steam Horizontal Storage Heater

Fig. 5. Whitlock Type R Instantaneous Heater, U-Bend Pattern

Convertor for Hot Water Heating Systems—Reheating the water returning from the system to the temperature at which it should enter the system.

Condensation Cooler—(Also called drip cooler, economizer and preheater.) For this use the instantaneous heater is equipped with baffles to increase its efficiency in heating service water while cooling condensation returns. Of especial benefit where steam is purchased and condensation can not be returned to boiler. Write for Bulletin No. 100-SA.

TABLE IV. STANDARD SIZES, CAPACITIES, DIMENSIONS AND WEIGHTS OF WHITLOCK TYPE R INSTANTANEOUS HEATERS

Sizes 0 to 10, inclusive, have 3/4-in. o. d. No. 18 B.W.G. copper tubes.
Remainder have 1-in. o. d. No. 17 B.W.G. copper tubes.

Sizes 0 to 10, inclusive, have 3/4-in. o. d. No. 18 B.W.G. copper tubes.
Remainder have 1-in. o. d. No. 17 B.W.G. copper tubes.

Sizes 0 to 8, inclusive, have 3/4-in. o. d. No. 18 B.W.G. copper tubes.
Remainder have 1-in. o. d. No. 17 B.W.G. copper tubes.

Above capacities based on steam at atmospheric pressure corresponding to a temperature of 212° F. Companion flanges are furnished for connections 3 in. and larger. Supporting cradles will be furnished only when specified. Larger size heaters can be furnished if needed.

Types

Type AC—Copper coil design, similar to Type A Feed Water Heater shown in Fig. 6, in which the water heated comes in contact with copper and bronze only. Of value, too, in heating liquids which corrode iron or steel. Write for Bulletin No. 24-SA.

Type R—This type (Fig. 5), with heating section made up of U-bends of seamless copper tubing firmly expanded into a rolled steel tube sheet, is recommended for all usual conditions, as it is of simple construction and allows for unlimited expansion and contraction. Standard shells are of cast iron on smaller sizes and steel on the larger sizes, but can be made to suit working conditions.

Table IV shows capacity and general dimensions of the standard two, four and multi-pass heaters at various temperature ranges. A Whitlock Engineer should be consulted for advice on other temperature ranges and higher steam pressures. Bulletin No. 25-SA, containing full particulars, sent on request.

Type S—Similar to the Type R, except that the heating section is made up of straight tubes with one end expanded into a rigid tube sheet and the other end expanded into a floating tube sheet to allow for expansion and contraction. These heaters are used where the water deposits a large quantity of mud or scale-forming materials and must be cleaned frequently.

Whitlock Heaters for Various Classes of Service

Feed Water Heaters

The type A American standard feed water heater, shown in Fig. 6, has been the standard design for this service for over 30 years. For some cases, heaters of Type R or Type S construction are used for this service also. Write for Bulletin No. 13-SA.

Indirect or Submerged Type Heaters

In the submerged type water heaters the copper tube heating section is located below the water line of the steam boiler. Boiling water from the steam boiler then heats the domestic water supply. The storage tank is preferably a part of the submerged heater, Type K construction—but it may be independent of it and of Type R construction.

This type of heater is proving very satisfactory for many reasons. It takes the heat required at such a uniform rate that it gives better fuel economy. It uses heat otherwise wasted by uneven firing and general overheating. It eliminates a separately fired water heater, can be used where headroom is very limited, and

requires no condensation pumps or traps and no temperature regulator.

Fig. 6. Type A Standard Feed Water Heater

Fuel Oil Heaters—Heat Exchangers

In addition to the apparatus described in these pages, we manufacture all types of heat transfer equipment.

Our years of experience in this line are at the command of prospective customers everywhere.

With the increasing use of oil as fuel, the importance of a properly designed fuel oil heater becomes more and more evident. We offer several types fitting every possible condition as to capacity, temperature range and cost.

For some conditions and some oils the coil type is preferable, and for other conditions the U-Bend construction or straight tube construction is more desirable.

We are prepared to recommend the proper type for any condition. Bulletin No. 31-SA containing complete information sent on request.

Engineering Service

Architects and engineers interested in heat transfer apparatus will be interested in literature and data which we are publishing from time to time.

We will gladly furnish sample specification sheets, typical installation diagrams, and specific advice on any problem in this line.

Personal Service

We maintain sales offices or representatives in each of the cities listed at the beginning of these pages. Many of these men were trained in our factory and have had practical experience in both laboratory and field. All of them are fully qualified to give personal service on any specific problem.

Hot Water Heating Systems

Hot Water Converter

One class of installation in which the Type "R" instantaneous heater is widely used, is in the heating of water for hot water heating systems. As so applied the heater is usually known as a "converter."

The Illustrations

The illustrations herewith show typical installations of this class, Fig. 7 showing a single unit as connected for a residence or building, and Fig. 8 showing a battery of three units as used in large factories or institutions.

Fig. 7 Typical Piping Plan Single Type "R" Converter

Both of these illustrations show the so-called "forced circulation" method of operation, that is with the water being forced through the converter, radiation and connecting piping by means of a pump.

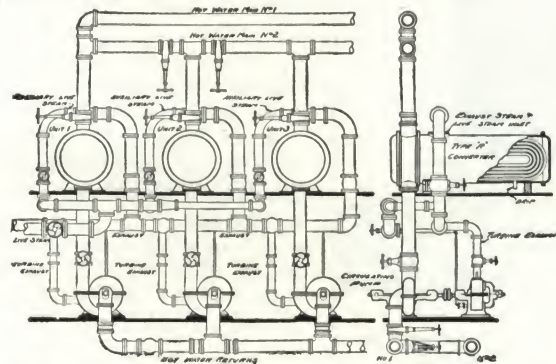

Fig. 8 Typical Piping Plan of 3 Type "R" Converter Connected Parallel

The "gravity circulation" method is also widely used, in which the flow through the system is induced by the difference in specific weight of the ascending hot column of water issuing from the converter and the descending cool column of water leaving the radiation.

The essential differences between these two systems are the following:

The advantages of the gravity method are simplicity, absence of any moving parts and elimination of power cost for promoting the circulation.

The advantages of the forced method are, on the whole, more pronounced. They include the possibility of using smaller pipe lines to supply a given amount of radiation, a smaller converter for a given duty, the ability to carry the heating water for long horizontal distances, the ease of exact control of the amount of heat supplied to the radiation and the possibility of carrying relatively heavy over-loads.

In gravity systems both the pipe lines and converters must be so proportioned as to allow keeping the water velocity from about 50 to 100 ft. per minute, as the total head available to effect the circulation is relatively small and the head losses due to friction must therefore be kept extremely low.

In the forced system on the other hand, the water velocity may be raised 250 to 300 ft. per minute or even higher and the resulting loss of head due to friction is limited only by the limit which it is desired to place on the power used to effect circulation.

Whitlock Type "R" converters are regularly built for both gravity and forced circulation, the design and construction being carefully proportioned in each case, to meet the desired operating conditions.

Tables

The tables given herewith, Table V and Table VI are sample rating tables for Type "R" converters of various capacities. A few words in explanation of these tables are in order.

In Table V the ratings are expressed in sq. ft. of direct radiation since this is the method generally used in connection with gravity hot water heating systems. The figure given is total radiation, hence, in selecting the proper size of converter for any given project the total radiating of the supply mains and branches must be included in the figures used. Where the exact radiating surface of the supply main and branches is not known, or it is not desired to calculate this exactly, it is customary to add 25% to the total amount of direct radiation, to allow for this factor.

Ratings based on any ranges not given in this table will be furnished on application.

In Table VI the ratings are based on gallons of water per minute, this being the most commonly used method in connection with the forced circulation type of system.

Ratings based on ranges not given in this table will, of course, be gladly figured and supplied.

In both of these tables the size of converter required to perform a given duty is indicated by a symbol number consisting of two numbers or a number and a letter. The first number in each case refers to the size of the standard type "R" converter or heater (required for the given duty) as given in our Bulletin No. 25. Where the second figure is a number or the letter M, it indicates the number of passes recommended in the heater (that is 2 pass, 4 pass or multi pass). Where the letter S follows the first number, it indicates a "special" heater having the same diameter as a standard two pass type "R" heater of the size number indicated, but a somewhat smaller overall length. Exact specifications of these "special" heaters will be furnished on request for any given duty.

TABLE V. SIZES WHITLOCK TYPE "R" CONVERTORS FOR VARIOUS DUTIES—GRAVITY CIRCULATION

THE BEILMAN WATER HEATER CO., INC.

Manufacturer of Automatic Storage Water Heaters

BUFFALO, N. Y.

NEW YORK CITY REPRESENTATIVE: WALTER H. PEARCE, 23-41 35th St., LONG ISLAND CITY, N. Y.

Beilman-Seamans' Improved Automatic Gas Fired Storage Water Heaters with Automatic Pilot Burner

These combination gas fired water heaters and storage tanks have stood the test of over 35 years of service.

Thousands now in use. All heaters guaranteed. There are no coils to clog, freeze or give trouble.

They burn natural or artificial gas, the only modifications being in the burners.

In artificial gas installations, heaters can be economically connected to the water section in the house furnace or kitchen range so that the gas can be cut off entirely when furnace or range is in operation, or, a coal fired heater can be supplementarily installed.

These heaters supply any quantity of hot water, temperature as desired. It takes 30 to 40 minutes to heat any capacity tank to 170° F. when started from cold. After contents of tank have been heated to the predetermined temperature, hot water can be drawn instantly, whenever desired,

from all hot water faucets. After water in the tank is heated to the predetermined temperature, the main burners automatically shut off and the patented auto-

matic pilot light which will reduce itself (with by-pass, which prevents pilot from being extinguished) holds the water to the proper temperature until hot water is drawn, whereupon the main burners light from the pilot.

These heaters are easily adjusted to any predetermined temperature, also to high or low gas pressures.

The specially improved burners provide perfect combustion and give an intense heat. They are directly under the boiler, which is considered to be the most economical and direct method known.

Special float check valves can be furnished extra for return pipe circulation. These valves prevent the mixture of cold water from the bottom of the tank with hot water on the faucet line.

These heaters can be supplied with the Barber gas burners and Beilman's patent automatic pilot.

The Smallest and the Largest Size
24 and 570-gal. heaters. These and 23 intermediate
sizes meet all requirements

General Notes

Any size heater up to 120 gal. can be run with 3/4-in. gas pipe on natural or artificial gas, 1-in. pipe being required for larger sizes only. Some of our 30, 40 and 50-gal. heaters are run on 1/2 and 3/8-in. gas supply.

Number of heater in price list corresponds to number of bathrooms that each size heater up to No. 15 will supply at one time. No. 16 will supply 20 baths; No. 17, 24 baths; No. 18, 28 baths; No. 19, 32 baths; No. 20, 35 baths; No. 21, 40 baths, besides laundry and other fixtures.

All heaters with 5-ft. boilers (Styles X and XX) can be set under ceiling from 6 1/2 to 7 ft. Larger size heaters than listed above can be supplied if required.

Where two like numbers are given for same capacity heaters, the difference is for a heater with short or long boiler to suit conditions; that with short boiler is listed higher in price.

Pipe to chimney should not be reduced in size and a damper should not be installed therein.

When heaters are set on a wood floor, the latter should be protected against fire.

Products

FLORENCE OIL BURNING WATER HEATERS.

Also Florence Electric Ranges, Gas Ranges, Oil Ranges, Ovens, Oil Room Heaters, Oil Cabinet Heater.

The Florence Kerosene Oil Burner

Consists of a specially constructed burner bowl and inner and outer chimney. Burner bowl is a narrow circular trough in which is a Florence *asbestos* starting ring or kindler. Heat from the starting ring at first, later from the flame itself vaporizes the kerosene. This vapor rising in the channel formed by the chimneys is thoroughly mixed with air by means of perforations carefully placed in the chimneys. Complete combustion takes place in all parts of the flame and produces an intense heat with no smoke or soot. The flame may therefore be focused close-up to the surface to be heated so there is no loss of heat by diffusion into the room.

Florence Automatic Storage Water Heater, No. WB31

A complete, automatic, water heating and storage unit which burns kerosene, a cheap fuel. It operates under thermostat control and maintains a supply of hot water. A 30-gal. boiler, heavily galvanized inside and out, is encased in a sheet steel shell. Dead air space between boiler and shell provides effective insulation. Water chamber extends two-thirds the length of shell. Walls continue and form a hollow shell that surrounds burner. Every boiler is given a 250-lb. hydrostatic test.

The parts of the heater are shown in the diagram below. Thermostat, manufactured by The Fulton Co., consists of parts which have been in successful use for over 30 years. Pilot light is a small wick enclosed in a tube that has no connection with the rest of the burner bowl. It consumes no appreciable amount of oil. A regulator can be set for the degree of hot water wanted, and can also be turned to shut off the burner, if ever desired.

Oil consumption depends on the amount of hot water used. Two gallons will operate the

No. WB31

Floor space required 28x19 in.

Fig. 2

Showing how the opening and closing of the flow of oil to the burner

Florence One-Burner Water Heater with Thermostatic Control, No. W13

For connection to any standard 30-gal. range boiler. Burns kerosene, is fully automatic, completely runs itself indefinitely and maintains a supply of hot water.

Automatic Operation—Is by means of a thermostat. It consists of the same time-tested parts as used in the storage water heater. Thermostat stem is placed in the intake pipe at the back of the heater. The bellows, projecting outside, is protected by a steel casing. A simple system of levers connects the copper bellows and the burner bowl. Raising and lowering the burner bowl in and out of the oil level regulates the flame.

Manual Operation—Heater can be operated entirely by hand. With the control lever in the manual groove the burner can be put out at any time by simply lifting the lever to the top of the groove.

With the lever in the manual groove the burner heats one boiler full of water and shuts off automatically.

It must be relighted by hand to operate again.

Water is Pre-heated—Water is thoroughly warmed or pre-heated in the pre-heating water chamber before it enters the coil. In using this pre-heating method Florence works on the most advanced principle of heating water.

No. W13
Floor space required, 19½ x 17 in.
Height, 41 in.

A close-up of the Indicator Plate

Florence Oil Burning Water Heaters, No. W12 and W21

They are designed to be hooked up with any 30-gal. range boiler as an independent unit or as an auxiliary to a furnace or kitchen range hot water system.

Easy Installation—Connections on all heaters, at both the hot water outlet and cold water intake, are carried through so that the plumber can do all his work on the outside of the heater.

Economical—Under normal domestic conditions a Florence Heater heats a 30-gal. tank of water for 4 to 4½ cents.

W12 Water Heater—Is a one-burner, popular-priced unit similar to No. W13 but without the thermostat control, see illustration of No. W13. The giant, high-powered, Florence burner focuses its intense heat close up to 20 ft. of ¾-in. (outside dimension) copper tubing.

W21 Water Heater—Is a two-burner unit. It has two standard, powerful Florence burners that focus their hot, blue, gas-like flames directly on to 28 ft. of ½-in. (outside dimension) copper tubing.

No. W21

Floor space required, 20x17 in.
Height, 39 in.

The
Premier
INSULATED AUTOMATIC
STORAGE GAS WATER HEATER

The
Keystone
INSULATED AUTOMATIC
STORAGE GAS WATER HEATER

How They Operate

The tank consists of two compartments, the upper containing the stored water—the lower encasing the heating element, burner and pilot. Sturdily constructed throughout, there are no delicate parts to give trouble.

When the heater is first lighted, the storage supply is quickly heated to the temperature at which the control is set. This is usually 135° F., but can be adjusted from 80° F. to 190° F. Instantly the set temperature is reached, the thermovalve, with instant-action, shuts off the gas supply to the main burner, and there is a tank full of hot water ready for *instant service*.

The automatic action is extremely simple. When hot water is drawn from the storage, cold water from the city mains enters at the top (left-hand side) and is discharged near the bottom of the tank. The cold water chills the thermorod which causes the control to automatically open and the heating process begins at once. Thus the storage supply of hot water is constantly maintained.

Simplicity is also marked in the circulatory movement of the water once the heating process begins. Cold water enters the heating element at the top and is carried through the arms directly to the bottom compartment. Here it travels in a flowing stream directly over the hottest portion of the burner flame, absorbing practically every heat unit of gas used. As the water is heated, it rises rapidly through the central circulating pipe to the top of the tank.

This method insures quick circulation, greater efficiency and economy of operation.

Premier Features

Prem-O-Stat safety pilot control
Quick removable brass heating element
Heat seal rock wool insulation
Blue flame bunsen burner
Double extra heavy tank
Instant action thermostat
Gas line, drain line and interior fittings all brass or copper
Superheat deflector
Draft hood
Galvanized steel outer drum
Gray enamel finish

Keystone Features

Quick removable heating element
Instant action thermostat
Heavily constructed tank
Heat seal rock wool insulation
Keystone patented blue flame burner
Interior fittings brass and copper
Superheat deflector
Draft hood
Galvanized outer drum
Gray enamel finish
Gas pressure regulator

This Laboratory Approval Seal is a guaranty of compliance with basic national requirements for safety

Other Crane Water Heaters

In addition to the Premier and Keystone Gas Water Heaters, the Crane Royal Heater is available in larger sizes suitable for larger homes, small apartment buildings, and restaurants.

The Crane Marvel Non-automatic Water Heater is available in five sizes, ranging from 12 to 50 gal. capacity.

For heavy-duty water heating beyond the capacity of the above heaters, the Basmor Gas-fired Boiler, shown on the following page, is recommended.

Consult your nearest Crane Branch or write to Premier Heater Division of Crane Co., LaPorte, Indiana, for an A. I. A. file folder descriptive of the entire line.

Basmor Gas Fired Boilers

Heavy Duty Water Heating for Large Homes, Apartments, Hotels, Restaurants, Office Buildings, etc.

Type WIM (Indirect Method)

Type WDM (Direct Method)

Indirect Method—Type WIM

The indirect method of heating water is by far the most satisfactory and is strongly recommended. Heating is done by transfer of heat from steam to the water by an external heater or coils in the storage tank. Copper steam coils located in the tank are preferred.

This method has the distinct advantage of preventing sediment, lime and other mineral matter being deposited in the boiler sections. This means longer life of the boiler with a maintenance of constant efficiency, immunity to high water pressures and shocks, and no discoloration of the hot water delivered. It is the most practical method of heating large quantities of water yet devised.

Equipment—Basmor Gas Fired Boilers, Type WIM, are furnished with the following equipment:

Housing and Insulation—Enameled exterior jacket complete, heavy air cell asbestos insulation, scientifically designed draft hood.

Controls—Gas pressure regulator, gas operated "instant action" gas valve with throttling type flame regulator, main gas shut-off valve, Basmor thermostat (tank).

Safety Features—Safety gas control, pop safety valve, steam pressure regulator and low water cut-off.

Also steam pressure gauge with water seal, water gauge and try cocks, boiler drain faucets, auxiliary pilot, thermometer (tank). All necessary fittings for front and side manifold. Pilot line and tubing for controls on boiler, but not piping to thermostat in tank.

Direct Method—Type WDM

The direct method is practical where water conditions are satisfactory, especially for smaller installations. With the direct method water is circulated through the boiler for heating. Boiler sections are of substantial construction to withstand a water working pressure of 60 lb.

No. 4-WDM-2 (2 section) does not have the master diaphragm valve as gas is controlled directly through the tank thermostat.

Equipment—Basmor Gas Fired Boilers, Type WDM, are furnished with the following equipment:

Housing and Insulation—Enameled exterior jacket complete, heavy air cell asbestos insulation, scientifically designed draft hood.

Controls—Gas pressure regulator, gas operated "instant action" gas valve, main gas shut-off valve, Basmor thermostat (tank).

Safety Features—Safety gas control, relief valve (tank).

Boiler drain faucets, thermometer (tank), auxiliary pilot. All necessary fittings for front and side manifold pilot line and tubing for controls on boiler but not piping to thermostat in tank.

Electrical Operation

Basmor Boilers can be supplied especially equipped to operate electrically and should be used where the storage tank is located more than 35 ft. from the boiler. Low voltage wires are run from the electric thermostat in storage tank to the electrically operated master diaphragm gas valve thereby operating electrically instead of by gas. Electrical equipment will not be furnished unless specified.

Products

A complete line of WATER HEATERS for use with manufactured, natural, butane and liquefied gases, including Outer Flue and Tubular Automatic Storage Systems; Heavy Duty Automatic Storage Systems; Automatic Large Volume Heaters and Systems; Automatic Multicoil Heaters and Systems; Automatic Continuous Flow Heaters; Tank Water Heaters.

Hoffman Automatic Storage Systems

Tubular Flue Type—Three Sizes—Hoffman Tubular Flue Automatic Storage Systems show ex-

ceptionally high efficiency because of their laboratory perfected heat control. Models 24 and 34 have six 1½-in. vertical wrought iron tubes extending from combustion chamber to top of flue area. Each tube contains a corrugated stainless steel baffle strip which controls the heat travel, permitting the water to absorb the maximum heat. Model 54 has ten similar baffled tubes.

Outer Flue Type—Four Sizes—In Hoffman Outer Flue Automatic Storage Systems the heat is conducted upward through the scientifically proportioned flue space between the water boiler and the inside shell. This heat travel completely surrounds the entire tank surface with the hot gases and provides a high degree of heat absorption into the water. Both Tubular Flue and Outer Flue models are equipped for use with liquefied gases.

TUBULAR FLUE TYPE

Model	Application
24	For small homes having usual bathroom, kitchen and laundry outlets.
34	For homes having 2 or 3 bathrooms, 1 or 2 extra lavatories, kitchen and laundry.
54	For homes having 3 to 5 bathrooms, 2 or 3 extra lavatories, kitchen and pantry sinks and large laundry.

175	100	78	78	60,000	60,000

Continuous Flow Automatic Thermostatic and Pressure Valve Water Heaters

Hoffman Continuous Flow Automatic Gas Water Heaters are made in two classes: thermostatic and pressure valve controlled. No. 35 is a pressure valve type. All others are thermostatic.

These heaters are universal in adaptability, operating with unfailing efficiency under all conditions of gas pressure and quality. They render exceptional service with either artificial or natural gas. The Storage Systems may also be operated with bottled gas, thus permitting their use in homes located beyond gas mains.

Selecting the Right Size—Under normal conditions selection of the proper size is an easy matter. The table in the next column gives recommended heaters for various requirements. The requirements are based on the number of hot water faucets that must be served at one time and the rate of flow per minute. Thus the total number of gallons per minute which may be required will indicate the correct size of heater.

The average home, using hot water in average quantities, will have an approximate flow demand, at any one time, of 3 gal. per minute. Hence Heater No. 3, as shown in the table, is the recommended size.

Since the requirements of the usual apartment are the same as the average home, assume a demand of 3 gal. per minute per family and provide a heater delivering 75% of the total. This size will supply adequate service, since not more than two-thirds of the faucets are likely to be open at the same time.

RECOMMENDED SIZES OF HOFFMAN HEATERS

Heater No.	Gal. per min. at 63° temp. rise	Application
35 Pressure valve	2	For cottages and bungalows, with 3 or 4 persons in the family. Furnished with leg base or wall brackets, for basement or kitchen installation.
45-T Thermostatic	2½	For either kitchen or basement installations in cottages and bungalows and to serve small families. Also furnished on leg base or wall brackets.
3 Thermostatic	3	For average homes and average families using usual hot water fixtures in bathroom, kitchen and laundry.
4-H Thermostatic	4	For modern homes housing 5 or 6 people and having 2 baths, or bath and extra shower stall, kitchen and laundry.
6-H Thermostatic	6	For large families in residences with 2 or more baths and extra shower stalls, kitchen, butler's pantry and laundry. Also suitable for small duplexes.
8-H Thermostatic	8	For largest dwellings, small hotels, apartments, restaurants, and similar heavy hot water demand installations.

Automatic Multicoil Storage System

To determine the correct storage installation:

(1) Ascertain the flow per minute of each fixture.
(2) Estimate times per hour each fixture will be used during hour of maximum demand.

(3) Estimate how many minutes each fixture will be used each time.

(4) Multiply flow per minute of each fixture by total minutes fixtures will be in use and add products. The sum will be the hourly demand.

(5) Estimate number of hours maximum demand periods will continue.

(6) Estimate at what intervals maximum demand periods occur.

(7) Estimate hourly demand during intervals between maximum demand periods.

(8) Specify a system having a potential rated capacity sufficient for the maximum demand period and the rated capacity of which is sufficient for the minimum demand periods and to heat, during the intervals between maximum demand periods, the storage capacity of the tank.

Hoffman Automatic Multicoil Storage System

Assembled and installed, fitted with thermostatic valve, circulators, etc.

SIZES OF HOFFMAN MULTICOIL STORAGE SYSTEMS

Size System	Application
No. 100 Heater, with 80, 100 or 150-gal. boiler	Residences having 3 to 5 bathrooms, extra lavatories, kitchen sink, pantry sink and laundry. Apartment buildings with 6 apartments each, having usual hot water outlets.
No. 200 Heater, with 100, 150, 200, 250 or 300-gal. boiler	Residences having 5 to 8 bathrooms, extra lavatories, kitchen sink, pantry sink, dishwashing machine, large laundry. Apartment buildings having 6 to 12 apartments, each having usual hot water outlets.
No. 300 Heater, with 200, 250, 300 or 375-gal. boiler	Residences having 7 to 10 bathrooms, extra lavatories, kitchen sink, pantry sink, dishwashing machine, large laundry. Apartment buildings having 10 to 20 apartments, each having usual hot water outlets.
No. 500 Heater, with 425, 500, 600, 720 or 860-gal. boiler	Apartment buildings having 20 to 30 apartments each with usual hot water outlets. Very large homes. 40- to 60-room hotels.

The Unit Volume Principle

The Hoffman Unit Volume Principle of water heating is the heating of water to a fixed temperature in a separate heating tank before passing the fully heated water to the storage tank. This heating method gives practically a one-temperature hot water supply. The variation in temperature is under 2%. Starting with the system filled with cold water, fully hot water is available within five minutes.

Automatic Unit Volume Storage Systems

Designed for large office or apartment buildings, hotels, schools, stadiums, swimming pools, country clubs, hospitals and industrial plants, where the hot water demand is practically constant for hours at a time.

The Hoffman Single Unit Volume Storage System consists of one No. 1500 Hoffman Automatic Water Heater, unit volume heating tank (insulated), motor pump unit, temperature control, thermometer, capacity control and gas regulator; with or without storage tank.

The Duplex, Triplex and Quad. Unit Volume Storage Systems have the same equipment, except that they have two, three and four No. 1500 Hoffman Heaters respectively.

Single Unit Volume Storage System

The following table gives typical combinations of heaters and storage tanks in various capacities:

*Size system	Hourly capacity heaters, gal.	Maximum hour capacity complete system, gal.	Capacity of system hourly for 3 consecutive hours, gal.	Total capacity of system for 24 consecutive hours, gal.
1/315	300	615	400	7515
1/430	300	720	440	7620
1/525	300	825	475	7725
1/720	300	1020	540	7920
2/525	600	1125	725	14925
2/720	600	1320	840	15120
2/940	600	1540	913	15340
2/1130	600	1730	976	15530
3/525	900	1425	1075	22125
3/720	900	1620	1140	22320
3/940	900	1840	1213	22540
3/1130	900	2030	1276	22720
4/720	1200	1920	1440	29520
4/940	1200	2140	1513	29740
4/1130	1200	2330	1576	29930
4/1300	1200	2500	1633	30100

*Numbers preceding line (/) indicate whether system is Single, Duplex, Triplex or Quad., while numbers following line indicate tank capacities in gallons. System 1/315, for example, is a single unit volume storage system with a 315-gal. storage tank.

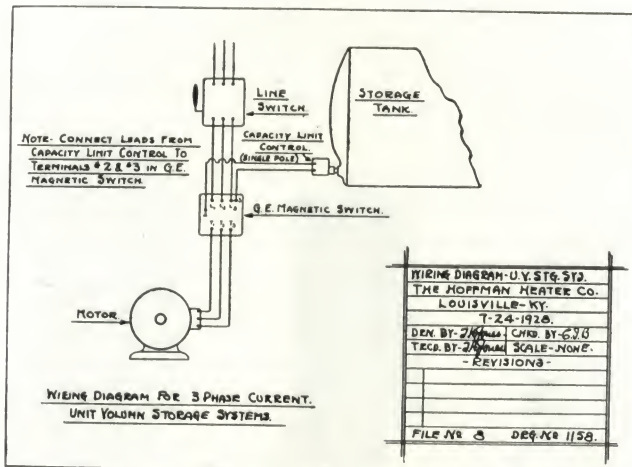

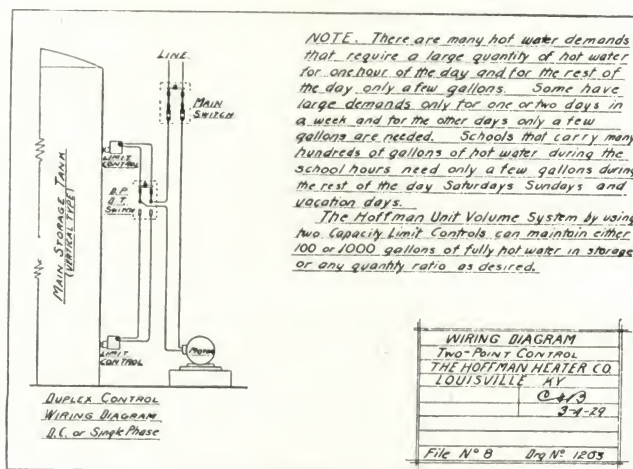

Below is a diagram of the point to point piping, showing flexibility of position of the four parts of the system.

This permits placing the gas heater near the chimney, assuring a favorable draft, and the storage tank near the point of hot water demand or in the least valuable space. The No. 1500 Heater represents approximately 8 hp.

Only do as much heating as will be needed.

In emergency, who knows which valves to turn? Simply open the switch to shut off fuel.

Magnetic Starting Switches Used in the Larger Installations

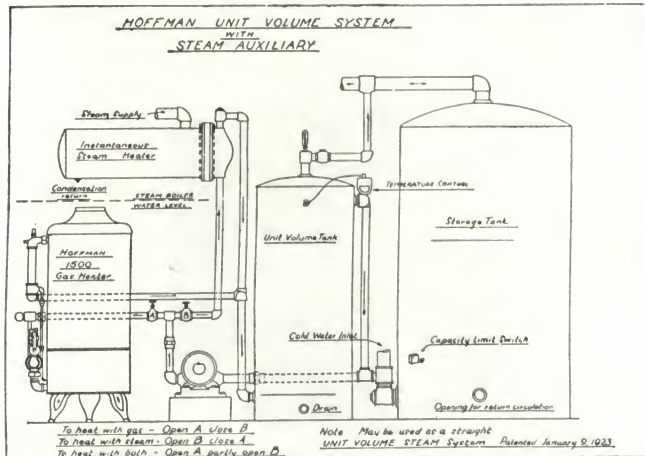

The fuel control thermostat is low in the storage tank, thus maintaining as much fully heated water as is usually maintained in storage tanks nearly twice as large.

Continued on next page

Automatic Steam Unit Volume Storage Systems

These systems use the instantaneous type of steam water heaters as the gas systems use the instantaneous type of gas water heaters. Low pressure steam heaters do not generally require automatic steam control. High pressure steam heaters automatically turn on and off the steam supply as the gas heaters turn on and off the gas supply.

Steam Unit Volume Systems are available in single units having recuperation of 600 to 6000 gal. per hour. Multiples of these single units are used for larger demands.

From Gas to Steam with but Two Valves

A simple method of absorbing any excess steam available

Takes the Place of a Storage Tank with Steam Coil

Only the steam heater need be above the boiler water level. A tank full of hot water at one temperature with a steady low rate of steam demand

This Booster Will Maintain the Hot Water Supply Temperature with Either Gas or Steam Until Recuperation Exceeds Demand

In the usual gravity installation, the longer demand exceeds recuperation the greater will be the drop in the hot water supply temperature. Steam control shown.

Connected in Series

To avoid marring a building for the entry of a very large storage, divide the capacity into sizes that will enter a door or window. Simply connect in series, placing the capacity control 6 in. above the entry of the supply water

A Large Water Heating Installation

The ability to use storage tanks in series and heating equipment in multiple, makes very large water heating installations quite simple with either gas or steam or both. The storage tank may be either vertical or horizontal or a combination of both as space and headroom will permit

Oxygen Trap

The rapid destruction of hot water lines is due to the oxygen set free by heating. This free oxygen in hot water is in the form of thousands of tiny bubbles.

To gather these bubbles, break them within an air

chamber and discharge the oxygen is the work of the Hoffman oxygen trap.

This trap is estimated to be about 80% efficient. It costs but a few dollars and would be worth many times its price if it were only 10% efficient.

HOLYOKE HEATER COMPANY

Kerosene, Gas and Auxiliary Water Heaters

HOLYOKE, MASS.

- "HOLYOKE" INDIRECT HEATERS.
- "HOLYOKE" FIRE POT GENERATORS.

Slogan

"The Heart of the Home."

"Holyoke" Kerosene Tank Water Heaters

Hot water is no longer regarded a city convenience alone—the suburban and country homes may also enjoy one of the greatest household necessities—hot water and plenty of it—through the installation of a "Holyoke" Kerosene Water Heater.

The design of the "Holyoke" quadruple patented copper coil makes it an unusually rapid heater. The tubes are of such size that, in the aggregate, they present the greatest practical amount of heating surface to a given volume of water passing through them. Each of the four tubes is $\frac{1}{8}$ in. in diameter with a total length of 30 ft. of tubing per coil.

"Holyoke" Kerosene Heaters are intended for attachment to any type of range boiler or tank and are non-automatic in operation, i.e., they are manually lighted and extinguished.

The burner is our *new improved* blue flame wick type. It is instantly and positively regulated and combustion is practically odorless. All heaters are now equipped with the swing burner which simplifies the care and operation of the heater. This is an exclusive "Holyoke" feature, fully protected by patents.

Shell is of cast iron attractively finished in durable black enamel.

The No. 4-30K (single) heater will heat water for toilet and shaving in 4 to 6 minutes after it is first lighted, for dishwashing in 15 to 20 minutes, and an ample quantity of hot water for the bath in about 45 minutes. The No. 5-60K (twin) heater will take care of the above in half the time. (The No. 4-30K heater operating at maximum capacity will raise the temperature of 1 gal. of water 14° F. per minute. The No. 5-60K heater will raise the temperature of 1 gal. of water 28° F. per minute.)

One gallon of kerosene (coal oil) is sufficient for 12 to 24 hours of operation per burner, depending upon

the height of the flame used. The oil reservoir holds 9 pints.

Both kerosene heaters are convertible into gas burning heaters when desired.

No. 5-60K (Twin) Kerosene Tank Water Heater

No. 4-30K (Single) Kerosene Tank Water Heater

"Holyoke" Quadruple Coil Gas Water Heater

The "Holyoke" No. 6-32 Gas Water Heater is equipped with the famous quadruple patented coil which makes it an unusually rapid heater. The shell is of cast iron, the lower part of which has an air jacket or double wall surrounding the heat zone. This air jacket serves as an insulator and minimizes the amount of heat radiated from the shell.

The "Holyoke" coil is reversible, that is, it may be removed and replaced in an inverted position after long use, thus doubling its life.

The burner is of the simple and efficient horseshoe type. Its adjustable air shutter insures perfect combustion. Burner is readily removable for cleaning without dismantling the heater. Finished in durable black enamel.

No. 6-32 Gas Tank Water Heater

"Holyoke" Double Coil Gas Water Heaters

The "Holyoke" Nos. 8-20, 8-25, 8-40, 8-50, 8-70 and 8-80 Gas Water Heaters are of the double coil type with a flared cast iron shell, allowing ample space for proper combustion.

The coil consists of two 3/4-in. 20-gauge copper tubes. Baffles on the coil direct the intense heat evenly to all parts of the coil.

A combination case and drip pan attached to the heater jacket supports the burner. This burner is designed after model approved by the U. S. Bureau of Standards.

Ground (ball) joint brass unions reduce installation costs.

Heater regularly furnished in jet black japan; also furnished in gray vitreous porcelain enamel at small additional cost.

These heaters have the approval of the American Gas Association Testing Laboratory of Cleveland, Ohio.

No. 8-40 Gas Tank Water Heater

A-16 Indirect Water Heater

A-4 Indirect Water Heater

SPECIFICATIONS—GAS HEATERS

Heater No.	Capacity, gal.	Coil		Height, in.	Diam., in.	Shipping weight, lb.
		Diam., in.	Lgth., ft. in.

Gas connections: 1/2 in. Flue connections: 3 in. Heaters equipped with two orifices for manufactured or natural gas. All "Holyoke" Gas Heaters, with the exception of No. 6-32, are furnished with ball joint brass unions with the following threads at no extra charge: 3/4-in. -20 fine thread, 1/2 and 3/4-in. Standard Pipe thread. Unless otherwise ordered, heaters will be equipped with 3/4-in. standard pipe thread ball joint brass unions.

"Holyoke" Auxiliary (Indirect) Water Heaters

"Holyoke" Auxiliary Heaters furnish ample quantities of hot water for all domestic needs when used in connection with the steam or vapor house heating boilers during the heating season.

They are designed to provide the greatest amount of hot water at the lowest cost. The "Holyoke" Auxiliary Heaters are inexpensive to install on account of being union equipped. Patents pending.

Models A-4, A-5, A-6, A-7, A-8 and A-9 have no brazed joints.

The two ends of the coil are expanded into the cover—the ground (ball) joint brass unions bearing directly upon the copper coil, insuring perfect joints—impossible for rust or sediment to collect.

"Holyoke" Fire Pot Generators

Holyoke fire pot generators are designed primarily for use in connection with a warm air furnace. They are obtainable in either cast iron, galvanized iron, or brass.

All generators have an opening in the bottom for a drain or cleanout. Fins positively prevent deadening of fire. Tappings on these heaters are arranged to conform to openings in all present day hot water or steam boilers. Top tappings must be used for the hot water outlet. Cold water inlet may be connected to any other tapping that is most convenient. An ordinary 1-in. plug will close the tappings not needed.

FIRE POT GENERATORS

Lovekin

TRADE-MARK

The Lovekin Water Heater

Maintains a continuous supply of hot water with storage capacities as shown in Table 1. Entirely automatic in operation, and insures full flow irrespective of number of hot water faucets opened simultaneously. This heater has been on the market for 17 years and represents the highest grade materials and workmanship.

Boiler Construction—See illustration, Fig. 3. Boiler and tubes are made of extra heavy gauge steel as shown in Table 1. All joints are full-welded, the boiler is tested for 250 lbs. pressure and then heavily galvanized. Multiple vertical tubes running full length of boiler provide most economical gas consumption by distributing heat throughout water body, a principle of design similar to Scotch fire-tube construction in marine boilers.

Patented spiral, corrugated baffle plates—an exclusive Lovekin feature—within tubes

prevent wasteful escape of heat into flue opening.

"Reverse dish" boiler head allows for expansion and contraction.

Thermostatic Control—On the No. 40, No. 50 and No. 60 sizes the water temperature is controlled by the Lovekin "Sylphon" Thermostat which has proved its merit through 17 years of practical use. It is snap action, positive working. Thermostat is set to heat water 140° F. and can be adjusted by user to 10° above or below this temperature. For greater range of temperatures, adjustment must be made at factory.

On the No. 22 and No. 32 sizes the temperature is controlled by a special Model 2-A Robertshaw, throttling type, 16 in. long—a time proven instrument. This thermostat is direct-acting and of the simplest design possible.

The gradual rise or drop of the temperature of the water produces a corresponding gradual rise or drop in the gas flame, thus producing the exact heat needed constantly and shutting

off to the pilot flame when set temperature is reached.

It is set for a temperature of 140° F. and is adjustable.

Lovekin Single Burner—So designed that scale and foreign particles cannot fall into openings

and clog them. The flame does not impinge upon the bottom of the boiler shell. This adds materially to the life of the heater.

No screen is used in the burner—a flash back is practically impossible.

Operates Efficiently Under Poor Water Conditions—The Lovekin operates independently of the water pressure and works perfectly where the pressure is poor or variable.

Where water is of a nature to cause considerable precipitation, the deposit in the base of the boiler will not affect operation of thermostat nor will it noticeably affect heating efficiency, as heat is transmitted to the water body through tubes running the entire length of boiler and is not dependent upon a single heating surface at the base.

Insulation

—The outside of the boiler is fully insulated with four ¼-in. layers of heavy corrugated air cell asbestos. All working parts of the heater are enclosed in one housing.

Because of this thorough insulation and the method of distributing the heat to the entire body of water, the water temperature is practically uniform throughout, there being less than 5° difference from top to bottom.

Safety Features—All Lovekin heaters are equipped with safety pilots which automatically cut off the gas supply if the pilot light becomes extinguished.

They are also equipped with pressure relief valves which relieve excessive pressure on the boiler.

Finish—The Lovekin is finished with a new metal top, adding immeasurably to its appearance. Brass fittings are used for the water inlet, outlet and drain cock. The flanges covering these connections are plated with chromium.

Heater is metal covered throughout and finished in Lacquer in the popular new Lovekin Slate Green.

Equipment—Heater comes completely assembled, with drain cock, gas cock, draft hood and brass fittings at water inlet and outlet.

Boiler

The Kumfort Water Heater

A moderately priced storage gas water heater which adequately meets the need of the average small home. Entirely automatic in operation with storage capacities as shown in Table 1.

Boiler Construction—Internally fired similar to the Lovekin but having a single 2½ in. heavy gauge fire tube running vertically through the full length of the boiler. A Lovekin patented spiral baffle is suspended in this tube; this exclusive feature assists in increasing the heat transfer into the water by retarding the flow of the flue gases and reducing the wasteful escape of heat into the chimney.

Thermostatic Control—Temperature is controlled by a Lovekin Klixon snap-action thermostat, simple in construction and positive in operation.

Burner—Equipped with the celebrated Cleveland Barber Burner with six jets placed at an angle which prevents dirt or sifting from clogging the openings.

This burner operates efficiently over a wide range of gas conditions (both artificial and natural gas), and is set so that the flame does not impinge on the metal.

No screen is used in the burner—a flash back is practically impossible.

Insulation—The efficient insulation of the Lovekin boiler, described on facing page, is also used on the Kumfort.

Finish—The Kumfort heater is metal covered throughout.

The shell is finished in aluminum with the top cap and base in black enamel.

Equipment—The Kumfort comes completely assembled, with drain cock, gas cock, 3-in. draft hood and water connections.

TABLE 1—SPECIFICATIONS

Type and No.	Rated capacity (approx.) gal.	Thickness of boiler shell, gauge	Boiler heads top and bottom, in.	Heating surface, sq. ft.	Gas consumption per hr., (approx.) cu. ft.

The Lovekin Heater is also made in 110-gal. size. Details on request.

TABLE 2—INSTALLATION SPECIFICATIONS

Heater for	Heater No.	Water connection, in.	Gas supply, in.	Flue connection, in.	Standard headroom, ft. in.	Minimum floor space, in.	Average weight crated, lb.
Small homes with 1 bath, kitchen, laundry; or small barber shop or beauty parlor. . .	Kumfort No. 20	$\frac{3}{4}$	$\frac{1}{2}$	3	5 0	23 x 17	220
	Lovekin No. 22	$\frac{3}{4}$	$\frac{1}{2}$	3	5 6	24 x 17	285
Average homes with 2 baths or large homes with 1 bath, kitchen, laundry and extra lavatory.	Kumfort No. 30	$\frac{3}{4}$	$\frac{1}{2}$	3	6 5	23 x 17	270
	Lovekin No. 32	$\frac{3}{4}$	$\frac{1}{2}$	3	6 0	26 x 19	380
For residences with 3 or more baths, and other fixtures; larger apartments; small office buildings; restaurants; etc. Choice should be governed by families' mode of living. When in doubt, use larger size. . .	Lovekin No. 40	1	$\frac{1}{2}$	3	6 0	27 x 19	390
	Lovekin No. 50	1	$\frac{1}{2}$	4	6 1	30 x 25	603
	Lovekin No. 60	1	$\frac{1}{2}$	4	6 4	32 x 27	687

General Facts

Guaranteed—All Lovekin and Kumfort heaters are fully guaranteed against defective materials and workmanship.

Safety-pilot Control—All Lovekin heaters are equipped with safety pilot which automatically cuts off gas supply if pilot light becomes extinguished. Safety pilot control on Kumfort heaters is available on special order.

Installation Notes

How to Specify—Install where indicated on plans.
 No. Lovekin Type 6-A [Kumfort Type 1] Storage-Automatic Water Heater. Connect ½-in. gas line from nearest gas supply to heater, and cold and hot water to heater as with a range boiler. Place a gas shut-off valve on the gas line near thermostat and a valve on cold water line near where it enters heater. Vent to flue as indicated on plan.

Choosing the Size—See Table 2 below. Where there is a question between two sizes it is advisable to select the larger.

Remember, however, that these heaters recover their set temperature more quickly than a coal heater and it is not necessary to specify as great a size of boiler.

Where to Place—To avoid long run of flue pipe the heater should be installed near a flue, and also as close as convenient to the faucets most frequently used (i.e. kitchen faucets in domestic installations). Usually installed in basement or laundry; occasionally for small installations, in the kitchen.

Return Circulation—Return circulating systems can be used in connection with a Lovekin, but the operating expense is higher than with the direct system.

In planning new houses, operating cost can be reduced in either direct or circulating systems by insulating the hot water supply pipes throughout the house.

Venting—A 3-in. vent, (4 in. for Nos. 50 and 60) preferably to a separate chimney, should be provided for in all cases. A draft hood is always furnished with heater. This draft hood is placed at top of the heater and prevents strong drafts either up or down the chimney from affecting the action of the burner or pilot.

MOTOR WHEEL CORPORATION

HEATER DIVISION

Manufacturers of Piatt Oil Burning Domestic Utilities

LANSING, MICH.

Piatt Oil Burning Water Heater

Adaptability

Made in a range of sizes suitable for use in the small bungalow and on up to large apartment buildings. Also for restaurants, clubs, office buildings, dairies, factories, resorts, car-washing racks, etc.

Recommended for use in all places except where a dependable supply of natural gas is available at a rate of 50c or less.

Operation

Automatic controls mechanically operated. Electricity or gas not required. Controls are simple, positive and dependable. Once lighted, flame is controlled according

Listed by Underwriters' Laboratories, Inc.

to water needed. Draft control automatic. Uses American Oil Burner Association Specification No. 1 furnace oil (38-40° distillate).

Construction

Sturdily constructed of the best materials obtainable. Boiler is heavy galvanized copper-bearing steel. Tested 300 lbs. hydrostatic pressure. Operates 125 lbs. hydrostatic pressure.

SIZES AND CAPACITIES

Model	Storage capacity, gal.	Heating rate per hour, gal.
20	18	18
40	36	20
60	47 1/2	20
80-S	68	100

Heating rate based on 70° temperature rise.

Piatt Oil Burning Forced Warm Air Furnace

Uses and Advantages

Uses—

For use in homes, stores, service stations, cottages, factories, and almost all places where heat is required. Completely automatic. May be placed in out-of-way location, yet have positive air circulation.

Pipe sizes may be reduced and run level.

Advantages—

Oil Burner built for furnace—furnace scientifically designed for Piatt Oil Burner. Inefficiency as associated with oil burners in ordinary warm air furnaces eliminates.

No gas required.

Burner noiseless.

Fan exceptionally quiet.

Humidifier pan provided.

Extremely high over-all efficiency.

Low operating cost.

Practically no maintenance expense.

Operation

Completely automatic. Oil burner

and blower controlled by thermostat in room. Equipped with all necessary safety devices to safeguard against misoperation.

Construction and Capacity

Constructed of the best materials obtainable.

Heating unit of welded steel construction with double the heating surface ordinarily found on coal-fired units of corresponding ratings.

Minneapolis-Honeywell electric controls used.

Detroit Lubricator Company's float control used.

"Furbo" centrifugal type fan with ball bearings.

Furnaces are supplied in three size capable heating loads, as follows:

No. 303..... 300 sq. in. of warm air pipe area
No. 304..... 480 sq. in. of warm air pipe area
No. 305..... 900 sq. in. of warm air pipe area

Ratings based on gravity circulation, with pipe sizes determined according to rules of the "Standard Code."

"Riverside" Massachusetts Regulation Copper Boilers

Two grades—"Riverside" 20-year Guarantee Copper Boilers, also a competitive line, somewhat lower in price, called "Riboco" Copper Boilers.

Styles—Low-tap (old style), Hilowtap and Universalaltap.

The Universalaltap boiler is especially made for building an automatic copper hot water storage system. The gas heater is connected on the side and the thermostat can be inserted in the 1-in. female tapping.

Gal.	Size, in.	Test pressures and working pressures
30	12x60	Mass. 200-lb. test; stamped 200-lb. test, 85-lb. w.p.
40	14x60	(Outside of Mass. can be used for 100-lb. w.p.)
50	16x60	Mass. 250-lb. test; stamped 250-lb. test, extra heavy 106-lb. w.p.
60	18x60	(Outside of Mass. can be used for 125-lb. w.p.)
80	20x60	Mass. 300-lb. test; stamped 300-lb. test, double extra heavy, 127½-lb. w.p.
100	22x60	(Outside of Mass. can be used for 150-lb. w.p.)
125	24x60	
150	24x72	

"Packo" Automatic Storage Systems

The "all-copper" "Packo" hot water storage system is built for the better class of homes. Only three connections are necessary upon installation: hot water, cold water and gas supply. All "Packos" are equipped with automatic safety pilots.

Equipment—Massachusetts Regulation Copper Boiler of 300-lb. test. "Klixon" snap-action control, draft diverter. Double copper coil heater, with non-backfire Barber burner and automatic safety pilot. All connections and piping for water are of brass. Interior boiler heavily insulated. Outer metal casing attractive copper-color finish.

30-gallon All Copper "Packo"

"Packo" No.	Approx. capacity, gal.	Height over all, in.	Width including heater, in.	Weight crated approx., lb.
20	20	57	25	203
24	24	65	25	225
30	30	65	29	258
40	40	65	36	300
52	52	65	36	520
66	66	55	40	660
82	82	65	40	820
100	100	65	42	925

Note: All hot and cold water tapings ¾-in. iron pipe size; gas connection ¾-in. iron pipe size—all systems except 20 and 24 gal. tapped on back ¾-in. iron pipe size for indirect heaters.

For large requirements use two systems connected in multiple. This allows a cutting off of one system without interfering with the entire domestic water supply.

"Riverside" Septic Tank

The "Riverside" Septic Tank is made of "Kopsteel." All joints and seams are welded, tanks are "asphaltized" after completion.

500-gallon Septic Tank

No.	Size, in.	Capacity, gal.	Average number of persons taken care of			*Average shipping weight, lb.
			Home	School	Factory	
200	38 d. x 48 ht.	200	6	13	11	250-260
300	47 d. x 48 ht.	300	10	19	16	310-320
500	52 d. x 60 lgth.	500	21	36	31	500-510
1000	60 d. x 96 lgth.	1000	41	56	51	900-925

*Weights are not guaranteed, as tanks are built to gauge and vary in weight.

"Riboco" Storage Systems

These systems are made with 300 lb. test copper or "Kopsteel" galvanized tanks. They are of the external flue type and direct fired by gas. Sizes made, 15, 20 and 30 gallon. They are beautifully finished in color scheme, but priced to meet the small home owner's pocketbook. Guaranteed in every respect. Just the system to figure on for speculative house developments.

Ruud Automatic Gas Water Heaters

Ruud Automatic Gas Water Heaters are made in two types—Continuous Flow and Storage—with a wide range of capacities, insuring a suitable size for any given hot water requirement.

(1) The Continuous Flow Type heats water instantly as it flows and burns gas only when the faucet is open. It has no tank.

(2) The Storage Type burns gas at a comparatively slower rate, but for longer periods, storing the heated water in a tank ready for use when needed.

Ruud Water Heaters are divided into six general classes—the Continuous Flow Type (Nos. 3, 4, 6 and 8), the Cottage Continuous Flow Type (the No. 95), the Storage Type (Nos. 40 and 50), the Multi-Coil Storage Type (Nos. 100, 200, 350 and 500), and the Ruud-Autohot Underfired Storage Type (Nos. 20, 30 and 45).

From this large quality line of water heaters, *perfect hot water service* is assured for homes of any size, for apartments, stores, factories, institutions, churches, schools, athletic plants or, in short, for any hot water requirement.

The chart on this page indicates the types and sizes that may be specified for ordinary residence work. For industrial and commercial use, it is recommended that you consult with the nearest Ruud branch or factory, listing all fixtures, lengths and size of hot water pipes, whether direct or return circulation is to be used, approximate hourly requirement, the average number of hot water users and whether the peak load is of one hour's duration a day or whether it is repeated.

Ruud, a Standard of Water Heater Quality

Four factories supply an international demand for Ruud products, and branch offices are located in every population center. These are manned by water heater engineers of long experience and you are invited to call for their assistance at all times.

Used with Protane Gas

Special models are made for use with Pyrofax and other bottled or protane gases. Write for information.

RUUD-AUTOHOT AUTOMATIC UNDERFIRED STORAGE WATER HEATER

A Low Cost Storage Heater

Ruud-Autohot, a low cost storage water heater, is made in three sizes. Used principally in residences, it also meets the small and ordinary commercial hot water needs.

It is self-contained and entirely automatic, maintaining an ever-ready supply of hot water in the heavily insulated tank, rapidly replaced upon withdrawal because of the powerful recuperative qualities of the system.

Ruud-Autohot is of the underfired type, needs no separate unit heater and because of this, needs no more floor space than its tank diameter.

Gas is controlled by: first, the Ruud All-metal Moment Valve which permits gas to burn only when the tank temperature falls to a pre-determined degree; and second, by the Ruud Automatic Gas Cut-off which closes the main supply line in case the pilot light is extinguished.

The system will operate perfectly with low water and gas pressures, and is ruggedly built for exceptionally long life.

General Features of Construction

(1) Smart, trim appearance. Shell in ivory finish with contrasting porcelain enamel trim of a terra cotta color.

(2) All mechanism directly in the front of the heater permitting installation in any wall off-set the size of the diameter of the heater.

(3) Entire burner assembly removable in one piece. Makes for ease of inspection, adjustment or repair.

(4) Hard brass gas supply line.

(5) Non-breakable pressed steel top, base and legs.

(6) All tank fittings are cast one-piece brass.

(7) Spring type pressure relief valve.

(8) Easily removable and replaceable tank. Tank heads are copper-brazed.

(9) Tank insulated with 1½ in. of mineral wool.

(10) Copper dip pipe.

(11) Ruud draft regulator.

(12) Adjustable needle valve and air shutter.

(13) Equipped with Ruud-Automatic Gas Cut-off.

Shuts off gas to main burner in event of pilot failure.

(14) Ruud Moment Valve (thermostatic control). Same as used on all Ruud Storage Systems.

(15) Lead-coated flue liner.

(16) Brass hose-end drain valve.

(17) Pilot lock.

TABLE 1—SPECIFICATIONS AUTOHOT UNDERFIRED STORAGE TYPE

No.	Tank capacity, gal.	Height over all, in.	Heater diam., in.	Size connections, in.			Weight, lb.	
				Flue	Water	Gas	Net	Crated
20	20	51	18	4	¾	½	185	215
30	30	65	18	4	¾	½	215	270
45	45	61	23	4	1	½	345	440

Shipped as a unit, ready to install by making gas, water and flue connections.

Ruud Copper Tanks If Desired

Ruud-Autohot is also made with copper tanks in all three sizes. All tanks are interchangeable. If at any time the user wishes to change to a copper tank it is a simple operation.

Ruud-Autohot Copper Systems are furnished 250 lb. test—106 lb. Massachusetts working pressure tanks.

Autohot Underfired Storage Type
Galvanized or copper tanks

Selection of Size

The following table sets forth the capacities of the three models and the requirements each is designed to meet.

TABLE 2—AUTOHOT STORAGE TYPE
Sizes of Systems and Their Application to Various Conditions

Size	Capacity, gal.	Application
No. 20	20	Residences with one bath, kitchen and laundry. Small family.
No. 30	30	Residences with one or two baths. Usual laundry and kitchen fixtures.
No. 45	45	Residences with two or three baths, usual laundry and kitchen fixtures.

Special Hard Water Model

Where water supply contains much lime or other mineral properties, Ruud makes a special model of Ruud-Autohot equipped with a handhole clean-out.

A small cover is held in place with four nuts and this once removed permits cleaning and scraping of the bottom and sides of tank. Slightly higher price for this model.

Quality Throughout

In every part, this unit has been designed to give a high quality hot water service at even cost.

RUUD MULTI-COIL AUTOMATIC STORAGE WATER HEATER

Description

The Ruud Multi-Coil Automatic Storage System, recently improved, is designed for conditions requiring a large supply of hot water at several faucets at one time. It permits every hot water faucet to flow as fast as the corresponding cold water faucets, and is suitable for large residences, apartment houses, small hotels, office buildings, hospitals, bathhouses, schools, gymnasiums, restaurants, factories, etc.

It is often used in apartment houses and institutions having a hot water supply tank heated in winter by steam coils. Used as an auxiliary under such conditions, the Ruud Multi-Coil System with the Ruud Moment Valve adds sufficient heat to keep the tank full of hot water when the heating plant is in partial operation. In summer, when the heating plant is closed down altogether, the Ruud renders perfect hot water service.

The hot water furnished by the heater is stored in a tank. The gas burned is controlled automatically by the temperature of the water in the tank by means of the Ruud All-Metal Thermostatic Moment Valve described in the next column. Gas is burned only when the temperature of the water in the tank is below the moment valve setting.

This system is especially adapted to low water pressure conditions, also low pressure gas supply because it burns gas at a relatively slow rate and over longer periods than the instantaneous (continuous flow) type heater.

The complete system consists of heater, tank, moment valve, thermometer, gas regulator, tank supports and magnesia insulation. Supports are not furnished with tanks larger than 500 gal. capacity. The circulator pipes and gate valves between the heater and tank are obtained locally after the system is placed.

Ruud Multi-Coil Automatic Storage Systems are distinguished for flexibility of service, efficiency in operation and for long life.

TABLE 3—SPECIFICATIONS MULTI-COIL STORAGE TYPE

Size heater	Height over all, in.	Width over all, in.	Size, circulator, in.	Flue, in.	Hourly B.t.u. capacity		Size gas line, in.	Minimum height to bottom of tank, in.
					Nat. gas, cu. ft.	Art. gas, cu. ft.		
No. 100	45	27	1½	5	77,000	80,000	¾	41
No. 200	53½	32	2	6	154,000	160,000	1	49
No. 350	61	36½	2½	7	270,000	280,000	1¼	56
No. 500	64½	38½	2½	8	385,000	400,000	1½	58

Selection of Sizes

The basis for determining the proper size Ruud Multi-Coil Storage System for any given condition is the *total number of gallons of hot water used during the period of heaviest demand*. Where the conditions are a great deal complicated, the services of our engineering department are always available.

TABLE 4 (MULTI-COIL STORAGE TYPE)
Sizes of Systems and Their Application to Various Residences

Size heater	Capacity of tank, gal.	Requirements
100	80, 100 or 150	Residences having 3 to 5 bathrooms, bedroom lavatories, large kitchen sink, pantry sink and laundry. Apartment buildings with 6 apartments of 4 or 5 rooms each.
200	150, 200 or 250	Residences having 5 to 8 bathrooms, large kitchen sink, dishwashing machine, large laundry. Apartment buildings having 6 to 12 apartments of 5 or 6 rooms each.
350	250, 300, 365 or 425	Residences having 7 to 10 bathrooms, large kitchen sink, dishwashing machine, large laundry. Apartment buildings having 10 to 18 apartments of 5 or 6 rooms each.
500	425, 500, 600 or 700	Apartment buildings having 20 to 30 apartments of 5, 6, or 7 rooms each. Very large homes. 40 to 60-room hotels.

Note: Larger capacity tanks, while not listed here, are available, and may be used with two or more Ruud Heaters. All tanks in black iron, galvanized or copper.

New Improvements

Changes in design are basically important in their contribution to higher efficiency, freedom from operating troubles and longer life.

Sizes have been changed in one particular; the No. 300 heater is now replaced with a No. 350 heater with an hourly heating capacity of 350 gal. based on temperature rise of 63°.

Other Features

These, long standard and merit-proved through many years of use, include:

The Ruud Moment Valve—No fuel control of greater reliability, economy and continuous, perfect performance has been discovered. The moment valve is snap-acting, being either "full-on" or "full-off" and gives full pressure and volume at the orifice, permitting a constant air-gas ratio in the mixer, which in turn guarantees a proper flame of even height and uniform characteristics.

The Ruud Automatic Gas Cut-off—Its reliability has been firmly established in thousands of units so equipped. It closes the main gas line in case of pilot failure.

Coil Arrangement—By ingenious arrangement all coils are separate and independent. In case one coil must be repaired or replaced, it can be removed from the heater and there will be no interruption in the service.

Burners—Ruud uses a full bunsen burner and with this type a proper flame is easily maintained, making for uniformity of operation and fixed efficiency. The burner is simple in design, easily taken apart for cleaning and uses only a flat brass gauze as flame check.

Ruud Tanks—Tanks vary greatly in ratio as to material and workmanship. Ruud tanks are made from flange steel; ordinary tanks are made of plate steel. Ruud weights for tanks are not theoretical. The highest standard known is employed in riveting, both as to size and spacing of rivets.

Ruud can also furnish copper tanks in many multi-coil combinations. Where brass or copper is used to pipe a building only a copper tank should be used for it eliminates all possibility of discolored water.

General Design

Ruud Multi-Coil Automatic Storage Systems are designed to give, within range of sizes and combinations, perfect and continuous hot water service at low, reasonable cost. The object of Ruud engineers has constantly been a harmonious meeting of these two factors, now through new improvements accomplished in greater measure than ever before.

Made in 4 sizes and combinations, with steam coils and without, with tanks of copper, black or galvanized iron, singly and in combination, it is entirely reasonable to say that Ruud can meet an overwhelming majority of Volume Water Heating Specifications.

RUUD AUTOMATIC CONTINUOUS FLOW WATER HEATER

Description

This type, newly improved, combines instant service, an inexhaustible supply with the highest efficiency attainable. The operation is automatic, gas being turned on or off by the flow of water when a faucet is opened or closed with a secondary and independent thermostatic fuel control that proportions the flow of gas to the quantity of water heated. The supply cannot be exhausted. Each size is built to a rated capacity, and as long as the faucet remains open hot water will be delivered at that rate.

This type may be installed in connection with a primary hot water supply from a furnace, boiler, coal range, etc., on the "reheating system," adding the needed heat to the water to bring it to the temperature required.

Its service is ideal for intermittent requirements, as it burns gas only when hot water is being drawn. In addition to the residence field, it is used largely in garages and auto wash stations, athletic plants, drug stores, beauty shops, etc.

Improvements and Construction

Engineering improvements have in general increased efficiency and life of this type unit and reduced in remarkable degree the need for maintenance service.

Of major importance is the change in the lower section of the copper heating surface from a conical to a straight, basket-type design. Enlargement of the combustion chamber thus made possible, has given the unit much greater flexibility. Combustion under proper conditions of gas flow, is practically complete; even when overgassed with 25% of volume, there is no change in perfection of combustion. General operating efficiency has been raised 82.5—85%. The coil and combustion chamber improvements now decrease shell temperature to a noticeable degree. Burners are held at much lower temperatures, lessening tendency to warp and flash, lengthening life and decreasing maintenance service. Coil life has been added through adoption of 17 gauge seamless, premium copper tubing as standard.

The requirements of the American Gas Association labora-

tory are greatly exceeded in all important particulars. Heating efficiency, for instance, is about 20% higher than the laboratory minimum.

Ruud Dual Fuel Control

Gas flow is automatically controlled by two separate and independent gas valves. Water flow operates one valve; water temperature the other. Gas burns in the quantity needed to heat water within exact degree limits.

Ruud Burners

Made in two simple pieces with a perforated flat flame check, easy to dismount and clean.

General Construction

All cast iron parts, shell, doors, top and bottom are heavy, substantial and long-lasting. Castings are of durable gray iron.

Recent price reductions in the residential sizes (Nos. 3 and 4) effect a considerable saving.

Selection of Sizes

Table 5 is a guide for the proper sizing of heaters. The size number corresponds to the capacity of the heater on a basis of raising the temperature of the water 63° F. Special conditions, the number of fixtures and people in the family, whether they use small or large quantities of hot water, should always be considered in using this general table.

TABLE 5 (CONTINUOUS FLOW TYPE)
Sizes of Heaters—Their Application to Residences

Size heater	*Gal. per min.	Residences having
No. 3	3	1 bathroom and kitchen sink, small family.
No. 4	4	1 family bathroom, 1 servants' bathroom, kitchen and laundry.
No. 6	6	2 family bathrooms, 1 servants' bathroom, kitchen, pantry, laundry and 1 or 2 lavatories.
No. 8	8	3 or 4 family bathrooms, servants' bathroom, kitchen, pantry, laundry and lavatories.

*These figures are approximate, depending on the temperature of the incoming water. The capacity is rated on a temperature rise of 63°.

TABLE 6—SPECIFICATIONS FOR CONTINUOUS FLOW TYPE

Size	Water inlet, in.	Water outlet, in.	Gas line, in.	Vent pipe, in.	Temp. raise, deg.	Hourly B.t.u. capacity		Gas meter	Weight, lb.	
						Nat. gas	Art. gas		Net	Crated
3	1½	1½	1	6	63	110,000	116,000	30 lgt.	262	335
4	1½	1½	1¼	6	63	137,500	145,000	45 lgt.	340	405
6	3¼	3¼	1½	7	63	220,000	232,000	60 lgt.	455	560
8	3¼	3¼	2	8	63	275,000	290,000	80 lgt.	565	670

Note: Standard pressure heaters require water pressure of 25 lb. per sq. in. at the highest faucet. When pressure is lower than this and not less than 5 lb., specify "Low Pressure" heater. No. 3 size is not made in "Low Pressure."

RUUD COTTAGE CONTINUOUS FLOW WATER HEATER

Ruud Royal Blue

The Ruud Royal Blue, a small size continuous flow type water heater, is ideal for cottages, bungalows and, in warmer climates, is suited for average family use.

Recent engineering improvements plus attractive Royal Blue color and low price secured for this unit a ready market in the small home class.

General Features of Construction

Mechanical features differ very little from the larger sizes of Ruud Continuous Flow Water Heaters. The rearrangement of water control and independent thermostatic control has only been made to facilitate installation in the small home.

The shell of this heater is heavy gray iron castings throughout, double-dipped japan in a royal blue color.

The coils are all 17 stubbs gauge premium copper tubing. All copper and brass waterways insure a rust-free hot water service.

TABLE 7 (COTTAGE CONTINUOUS FLOW TYPE)

Sizes of Heaters—Their Application to Residences

Size heater	*Gal. per min.	Application
No. 95	2½	For small hot water requirements. Ideally meets the needs of the modern small home where fixtures are compact, pipe runs short and where there are but a few people in the family.

*These figures are approximate depending on the temperature of the incoming water. The capacity is rated on a temperature rise of 63°.

TABLE 8—SPECIFICATIONS FOR COTTAGE CONTINUOUS FLOW TYPE

Size	Cap. gal. per min.	Temp. raise, deg.	Water line		Gas inlet, in.	Flue, in.	Gas meter	Hourly B.t.u. capacity		Weight, lb.	
			Inlet, in.	Outlet, in.				Nat. gas	Art. gas	Net	Crated
95	2½	63	½	½	¾	5	10 lgt.	92,000	97,000	200	270

Note: A water pressure at highest faucet of at least 25 lb. per sq. in. is required to enable these heaters to deliver their capacity at that point.

Products

WELSBACH HOTZONE and STAZHOT
SELF-ACTION STORAGE GAS WATER
HEATERS.

The Company

These automatic storage gas water heaters described herein are products of the WELSBACH COMPANY. For forty years this Company has manufactured gas burning appliances for the home.

HOTZONE
Welsbach
STAZHOT

Every one is familiar with the enviable reputation for reliable products which it has built up during that time.

The Hotzone and Stazhot heaters are the result of the best engineering skill and the vast amount of experience accumulated throughout this period. They bear the approval of the laboratories of the Good Housekeeping Institute and the American Gas Association.

WELSBACH HOTZONE AND STAZHOT SELF-ACTION STORAGE GAS WATER HEATERS

Description

In these heaters, gas under the control of a graduating thermostat is burned in a combustion chamber directly below the storage tank, and the products of combustion pass up through an annular space between the outside of the tank and an inner cylinder of lead-coated terne plate, giving up their heat to the whole exterior surface of the tank which acts as heat absorbing surface.

The annular space is so proportioned as to give the maximum of efficiency for wide variations in gas consumption and the exterior of the inner cylinder is insulated against the loss of heat by a heavy blanket of rock wool, the best insulation for the purpose.

As the water in the tank is heated, the thermostat automatically reduces the gas flow to the burner until, when full temperature is reached, only sufficient gas is being burned to keep the tankful hot, this gas passing around the thermostat valve through a by-pass.

The Hotzone is made in 15, 20, 30, 45, 60 and 80-gal. sizes, with double extra heavy 300 lb. test galvanized tanks. Hotzones may also be obtained with copper tanks, tested and tight at 250 lb. pressure per sq. in., and where specially needed 300 lb. pressure.

Temperature and Availability of Supply

The usual desired temperature of the household hot water supply is between 130° and 140° F. at the faucet, and to provide maximum satisfaction there should be available at all times an adequate quantity at this temperature.

Because of the method of heating and arrangement of the temperature control the Welsbach Self-action Heaters within their

capacity will supply a maximum of hot water. Repeated independent tests show less than 2° temperature difference between the first and last gallon drawn. Because of the uniformity of temperature of water from top to bottom of tank and the constantly maintained temperature, there is a large amount of useful hot water available.

When hot water is drawn from the tank the gas is immediately and automatically turned on by the thermostat and therefore recuperation commences at once. This assures a tank full of hot water at all times.

Recommended Heater Sizes

Sizes below are given as a general guide only. Conditions in each family will determine the proper size to specify.

Hotzone—No. 1—15 gal. For bungalows, small residences having one bathroom and usual fixtures with three or four persons in family.

No. 2—20 gal. For residences having one bathroom and usual fixtures and four or five persons in family; where there is a larger demand for hot water; small barber shops and beauty parlors.

No. 3—30 gal. For residences having two baths, or one bath with showers and usual fixtures; barber shops, beauty parlors, small restaurants, etc.

No. 4—45 gal. For residences having two or three baths; small apartments up to three or four families; large commercial applications.

No. 6 and 8—60 and 80 gal. For apartment houses and commercial installations.

The Stazhot is made in 15, 20, 30 and 40-gal. sizes, with 250 lb. test galvanized tank. The Stazhot is also furnished with copper tank where needed.

HOTZONE WATER HEATER

Standard Dimensions and Weights—Recovery Capacity, etc.

HOTZONE SELF-ACTION GAS WATER HEATER

No.	Capacity, gal., galv. & copper	*Recovery capacity	B.t.u. per hr.	Crated weights, lb.

F 20	F 19 1/4	F 22	F 24	F 28 1/2	F 28 1/2

Note: On Nos. 1, 2 and 3 add 6 in. to "B" for over-all height, including draft hood.

On Nos. 4, 6 and 8 add 7 in. to "B" for over-all height, including hood.

X-ray of Hotzone

The illustration shows the interior construction and the following clearly explains the Hotzone features:

Tank—Extra heavy, galvanized inside and out. Tested to stand a pressure of 300 lb. to the sq. in.

Flue Passage—Allows heat to circulate freely around entire tank, heating the water evenly from top to bottom.

Flue Liner—Lead coated shell of steel, surrounding tank and aiding in holding in the heat.

Insulation—Thick rock wool, carefully packed between the flue liner and outer shell. The best insulation for the purpose.

Outer Shell—Heavy gauge full-finished steel body stock, buff lacquered to give attractive finish.

Burner—Will not flash back or carbonize.

Thermostat—Direct acting, non-clog type. Controls supply of gas to burner. Can be adjusted for temperature.

Draft Hood—Properly designed to carry off combustion products. Standard stove pipe size.

Piping—1/2-in. gas, 3/4-in. water inlet and outlet.

Note: Can be supplied with safety gas shut-off and with temperature pressure relief valve at slight additional cost.

Note: Should occasion ever require, tank may be renewed by removing water connections and thermostat, without disturbing insulation, flue liner, combustion chamber or jacket.

Standard Connections for Hotzone

For the best method of connecting a Hotzone heater into the gas and water systems of the building, the following illustration will prove interesting.

Relief valves should be installed on all systems fed through lines having water meters or check valves to prevent excessive pressure in case of overheating. The relief valve should be installed in a tee mounted as close as possible to the inlet of the system as shown in the illustration below.

Method of Connecting One Hotzone Water Heater to an Extra Storage Tank of 100 or 200-gal. Capacity—It will be noted that the hot water outlet is connected directly to the side of the insulated storage tank and the take-off pipe is from the top of the tank. From the bottom a return cold water pipe connects to the cold water inlet in a standard "Y" fitting.

When the demands upon the hot water heating system will be unusually heavy, it may be necessary to connect Hotzone Heaters in multiple. The hot water outlet from each is joined, and enters the storage tank on the side as in the preceding case. The cold water inlet is also joined in a standard "Y" fitting with the cold water return from the tank.

Standard Connections for Hotzones

It is important in this type of installation to have number and kind of fitting between the two tees indicated on the hot and cold water lines and each heater, i.e., pipes AA should be of the same diameter and length, BB likewise, etc.

This will insure equalization of the load between the heaters and prevent by-passing. It is frequently desirable to make multiple installations using 2 or 3 heaters and by placing gate valves in the inlet line of each heater, it is possible to use only one heater at a time when the demand can be served by a single heater with resulting gain in economy.

DESCRIPTION OF STAZHOT WATER HEATER

The tank of the Stazhot Self-action Storage Gas Water Heater is galvanized inside and out, and is tested to 250 lb. pressure.

Can be supplied with safety gas shut-off and temperature pressure relief valve at slight additional cost.

Should the occasion ever require, tank may be renewed by removing water connections and thermostat, without disturbing insulation, flue liner, combustion chamber or jacket.

STAZHOT SELF-ACTION GAS WATER HEATER

Architectural Service Department

We maintain a special service department to co-operate with architects and engineers.

Circulation Water Heaters

Acme Circulation Water Heaters are the result of our painstaking efforts to bring about an electric water heater correct and complete in every detail. The liquid flow is completely surrounded by the heat, thus economically accomplishing a service. A beautiful appliance of correct design and sturdy construction.

ACME CIRCULATION WATER HEATERS

Cat. No.	Dimensions, in.		Watts	Price
	Diam.	Length		
421	3	15	125-500	\$22.00
422	3	15	188-750	24.00

429T	Tee	Non-by-pass		2.50

Furnished 110-125; 220-250 volts.
Threaded for 1/2-in. standard iron pipe thread at each end.

Acme Circulation Water Heater

Electric Radiators

The Acme line of electric radiators is complete. There is a radiator to meet every problem and solve it precisely and economically for the home, clubhouse, hotel, church, garage, factory, ticket booth, organ room,

Series D, Flush Type, Radiator

For close quarters where radiator space is desired to be utilized. No floor space consumed; out of the way; heats with precision and economy. Heating element is so arranged that depth of casing requires only 2 1/2-in. space, and will fit in any partition or wall. Can be so arranged that heat will project either from one side of wall or both sides.

From 1 1/2 to 3 kw.

Series A Radiator

For floor or wall mounting. Beautifully designed, very practical, and built in heat capacities to meet the requirements in the home, office, etc. Dimensions, 27 in. long by 12 in. high.

From 1 1/2 to 4 1/2 kw.

Series B Radiator

Particularly well suited for heavy duty where requirements for heating are considerable, as in church, meeting hall, large living quarters, and reception halls. Dimensions, 27 in. long by 23 in. high.

From 3 to 12 kw.

valve house, etc. The heating principle in this construction is beyond criticism. The exterior casing is a masterpiece for design and craftsmanship, and will blend harmoniously with the finest equipment wherever installed. Finished in art bronze.

Series E Electric Steam Radiator

Each radiator is a complete steam plant in itself, and is operated with the ease of mere turning on a switch. Can be moved from room to room (wherever there is an electric outlet). A few quarts of water will run one of these radiators practically an entire season without replenishing.

From 1 to 3 kw.

The Acme heating units are built in two distinct sizes—all made three-heat. A controlling switch is mounted directly on the heater. Non-corrosive, non-deteriorating water chamber. Nicked, and highly polished.

Hot Closets and Plate Warmers

Acme Hot Closets are designed for the butler's pantry as a warming closet for food and dishes. Because the heating

ACME HOT CLOSETS

1623†	35	20	28	400-1200	150.00

Furnished 110-125; 220-250 volts.

*Made with single door. †Made with double doors.

Closets other than above can be constructed by us to order.

element is of the Acme grid-type construction, heat is distributed efficiently and exactly throughout the entire cubic dimensions.

Made of black planished iron with nickelplated trimmings, consisting of hinges and latches. Interior is made of heavy gauge galvanized iron and provided with two galvanized iron perforated shelves. Sides and top are insulated with heavy layers of asbestos, preserving the heat. Three-heat switch for successful operation of this type of appliance. Prism light indicates operation.

Hot Closet
Cat. No. 1622

EDISON GENERAL ELECTRIC APPLIANCE CO., INC.

Product

HOTPOINT ELECTRIC WATER HEATERS.
Also manufacturers of Hotpoint Electric Household Appliances. Architects' handbook on request.

For Edison Electric Commercial Cooking and Baking Equipment, Hotpoint Electric Air Heaters and Electric Ranges, see Manufacturers' Index.

*Hotwater
by
Hotpoint*

Wiring, etc.

All wiring in both models is enclosed in a readily accessible wiring channel inside the heater case, and a standard outlet box is fixed to the top rear of the heater, easily accessible for the wiring connections. This outlet box and the hot and cold

water pipe connections are offset so that vertical lines may be run parallel without interference. Automatic temperature control. Thermostat controls the unit current direct without external relays or contactor.

Accelerator or Circulation Tube Models

Deliver hot water to the top of tank as heated, insuring *quick hot water*. Made in four sizes: 10-gallon, No. W28; 18-gallon, No. W41; 30-gallon, No. W43; 50-gallon, No. W44.

Each model provided with automatic temperature control (thermostat) giving uniform temperature hot water. An externally operated switch is also a part of each heater.

Heaters of this type deliver a maximum hot water service for a given tank capacity.

Obtainable in wattage rating up to 5 kw.

Finish and Insulation

The two-tone Alabastic white and gray trim glyptal baked enamel provides a finish that is highly attractive, easily cleaned and retains a permanent high gloss.

Balsam wool is used to insulate these heaters. It is highly efficient, light in weight and odorless.

Tanks are extra heavy and built to 250 lb. test pressure.

Plain Storage Heaters

These models raise the tank temperature uniformly. Made in three sizes: 30-gallon, No. W49; 50-gallon, No. W50 and 100-gallon, No. W38.

May be obtained in 500 to 6000-watt capacity.

Voltage

Standard voltage 230 a-c. carried in jobbers' stocks. Special voltages of 115, 125, 200, 250, obtainable on factory orders. All 5 kw. units are supplied in 230-250 volts only.

Address nearest district office for specific recommendations to meet requirements of clients.

ELECTRIC WATER HEATERS

Wide Range of Types

These heaters have been designed to meet the requirements of the central station and the home owner. They are made in a wide range of types to meet different wattages requirements, methods of operation and to provide ease of installation and servicing. The automatic types are controlled by the Spencer thermostat, especially adapted for water heater service.

The corox heating element, which is used in all but the Strap-on Heaters, is a special Westinghouse development designed particularly to meet the requirements of water heating service. It operates at a temperature only a few degrees above the surrounding water and has a slight expansion and contraction in operation, which tends to flake off scale and adds considerably to the life of the element.

The Adapt-o-matic—This leader of the Westinghouse line is a complete, insulated tank, with immersion type elements automatically controlled. Made in 30 and 52-gal. sizes and can be operated at various wattages by simply changing the terminal connections on the elements. The tank is thoroughly insulated with the highest grade balsam wool. The thermometer is set to maintain a water temperature of approximately 160° F.

The Adjust-o-matic—Another complete tank installation with a single heating element controlled by a three-heat snap switch, and regulated within temperature limits by the Spencer thermostat. With switch turned to "low" a water temperature of approximately 135° F. is maintained, on "medium" approximately 155° F., and on "high" approximately 180° F. Once the switch is set, the Spencer thermostat keeps the water temperature within predetermined limits without further regulation. The Adjust-o-matic is made only in the 18-gal. size.

The Aut-o-matic

—A complete tank heater with one heating element, at the bottom of the tank, controlled by a Spencer disc thermostat. In the 18-gal. size the Aut-o-matic is constructed with a circulation tube and the heating element installed from the bottom. In the larger sizes no circulation tube is used in the tank and the heating element is inserted from the side near the bottom. The 18,

30 and 52-gal. sizes are carried in stock. Shipments of the 85 and 100-gal. sizes can be made with but a few days delay.

Strap-on Heaters—Designed for installation on existing water tanks and are applicable for any tank of 12-in. diameter. The complete installation of this type consists of two heating units, with automatic thermostatic control, and an asbestos tank cover, properly cut to receive the heaters. "On-and-off" switch is mounted integrally with each heating unit in such a way that the switch projects through the tank covering, providing easy manual control of the heater.

Side Arm or Circulation Heaters—The Type CA is a full-automatic circulation heater, equipped with Spencer thermostatic control, and regulated by a three-temperature snap switch. The thermostat and switch are mounted at the head of the heater effecting easy manual control and heating element protection. A drain plug at the bottom of the unit permits easy removal of sediment. Threaded pipe connections in the outer shell take the standard 3/4-in. pipe.

Immersion Heaters—The Types CS and CA heaters can be obtained without casing for direct immersion applications. In the smaller sizes we have the DX heaters which are non-automatic and can be furnished with or without single heat snap switch. The DX heater is designed to fit a 1-in. pipe thread. CA, CX and DX heaters will stand 25 lb. steam pressure and are frequently used for heating liquids other than water. Information regarding special applications should be requested from the nearest district office.

Current Limiting Switch

This device is used to limit the combined load of water heater and electric range. It is a magnetically operated switch of the enclosed mercury tube type, non-radio interfering and unaffected by temperature changes. The switch is enclosed in a heavy box equipped with knock-outs for easy wiring. A flexible adjustment is provided.

For specification see Water Heater Catalogue 282

BADGER ALL-COPPER HOT WATER STORAGE TANKS for building and industrial purposes; also domestic tanks and boilers to be used in connection with heating apparatus.

BADGER COPPER and WHITE METAL PANTRY SINKS.

Also Badger Expansion Joints for low and high pressure lines.

All-copper Tanks

Badger All-copper Tanks are made from the best of copper by expert coppersmiths.

Interiors are thoroughly tinned to insure clean water. There is only one longitudinal seam, this being brazed and hard hammered. The heads have the correct radii. They are riveted to the shell with a generous lap. In riveting the copper is first drawset and then the rivets are upset and buttoned. Finally the seam is thoroughly sweated on the inside with solder.

Furnished complete with special size connections, manholes and steam coils, if desired.

Every tank is subjected to a hydrostatic test of at least 200 lbs. Boilers of 250 or 300 lbs. test can be furnished, if required. The working pressure of a tank should never exceed 42½% of its hydrostatic test.

Tank Specifications—to Facilitate Ordering

The following is frequently used by architects and found to be very satisfactory:

Furnish ... gal. Badger Copper Tank to be ... diameter x ... long; shell to be made of sheet copper weighing ... lbs. per sq. ft.; to have one longitudinal seam, said seam to be brazed and hard hammered; heads to be made of copper weighing ... lbs. per sq. ft.; said heads to be half-round type, riveted to the shell and thoroughly sweated on the inside with solder; one head to be fitted with ...x... composition manhole and cover; all connections on shell to be standard flanged type riveted on outside.

Material in tank to be tinned on the inside with block tin, and all seams and connections to be heavily backed with solder.

Tank to be tested to ... lbs. hydrostatic pressure.

Note: This company will supply weights for this specification to any architect who will furnish information regarding volume of hot water required and the water pressure.

DAHLQUIST MFG. COMPANY

Coppersmiths and Metal Workers

A, 2nd and 3rd Streets, SOUTH BOSTON, MASS.

Products

COPPER BOILERS including Heavy Pressure Boilers, Direct or Street Pressure Boilers, Tank Pressure Boilers, Wash Boilers and Pressure Barber Boilers.

DAHLQUIST AQUATHERM COPPER RANGE BOILER (patented), with or without water heater.

DAHLQUIST SUPER AQUATHERM COPPER AUTOMATIC STORAGE SYSTEMS; DAHLQUIST TURBO-AQUATHERM (Patented).

Also Steam Jacketed Copper Kettles, Corrugated Copper Expansion Joints, Metal Spinning of all kinds, Boiler Stands and Gas Water Heaters.

Dahlquist Copper Boilers

Satisfaction is assured. In durability, neat appearance and cleanliness, copper is beyond comparison. Copper resists rust and corrosion as no other tank metal can.

Dahlquist Turbo-Aquatherm (U. S. Pat. No. 1,762,-215, June 10, 1930)

A new invention and great improvement in hot water boiler design. Completely eliminates cause of burnouts in boilers, heating coils and waterbacks.

Hot water boilers and heating units have always suffered from a gradual accumulation of sediment and scale. This accumulation gradually insulates the water from the source of heat and, if allowed to remain, eventually causes a burned-out boiler, heating coil or waterback.

The Turbo-Aquatherm (patented) completely prevents this trouble by causing a turbulent circulation of the water in the bottom of the boiler whenever water is drawn from the system. This action is entirely automatic and is accomplished by natural flow of water through inlet pipe.

Automatic Gas Unit with Side Arm

The Turbo-Aquatherm (patented) is a specially designed venturi tube inserted in the inlet pipe adjacent to the bottom of the boiler. When water flows through the inlet pipe and the venturi, it reduces the pressure in the neck of the venturi which therefore draws water through apertures to satisfy this lowered pressure. This water is drawn along the bottom of the boiler with a scouring action and thus carries away any sediment which may have accumulated. Thus no sediment can possibly remain.

Four important things are therefore accomplished by means of this simple device. First, greatly lengthened life due to elimination of burnouts. Second, greatly increased thermal efficiency because of the elimination of the insulating blanket of sediment. Third, fresh hot water because no stale water is allowed to accumulate. Fourth, quicker hot water supply due to circulation system which permits heated water to be drawn off without giving up its heat to colder water in boiler.

Dahlquist Turbo-Aquatherm (patented) may be supplied on any Dahlquist range boiler or automatic storage unit.

Dahlquist Heavy Pressure Copper Boilers for Large Industrial Uses

Dahlquist heavy pressure copper industrial boilers are built to architects' and engineers' specifications in capacities up to 10,000 gal. with working pressures up to 300 lb. They are used for manufactur-

Heavy Pressure Copper Boiler

ing establishments, office buildings, hospitals—in fact wherever there is an exceptionally large demand for a constant supply of hot water. They are furnished with or without coils. Material and workmanship is of the highest grade, and each unit is thoroughly inspected and given full pressure tests at factory before delivery.

The illustration shows one of five 1000-gal. boilers for New York Life Insurance Building, New York, N. Y., Cass Gilbert, architect.

Direct or Street Pressure Boiler

Dahlquist Direct or Street Pressure Boilers

Made in two qualities: (1) Massachusetts Standard with 5-year guarantee, and (2) extra heavy with 25-year guarantee.

Both qualities meet the severe requirements of Massachusetts Range Boiler Law which permits use of boilers on a working pressure not exceeding 42½% of test pressure.

Boilers furnished with either low, "hilow," or universal tap.

Dahlquist Super Aquatherm Copper Automatic Storage Heaters

The Dahlquist Super Aquatherm copper automatic storage heater has been designed to furnish the home owner with a constant, never-failing source of steaming hot water without attention, and at low cost for initial installation, upkeep and fuel.

The boiler is made of copper of 250 lb. Massachusetts standard test. Surrounding the boiler is a heavy protective covering of asbestos insulation. The circulation of water in the boiler is controlled by the patented Aquatherm which gives the utmost in thermal efficiency and prevents the accumulation of sediment in the bottom of the boiler with consequent danger of failure and burnouts.

The heating unit is a powerful gas burner with pilot flame or an efficient electric heater for use where gas is not available.

The heating unit is controlled by an automatic thermostat which keeps the temperature of the water at the required degree of heat.

No.	Capacity, gal.	Heating unit	Price
20	20	Gas burner.....	\$110.00
20	20	Electric heater.....	150.00
30	30	Gas burner.....	150.00
30	30	Electric heater.....	200.00
40	40	Gas burner.....	200.00

H. GERSTEIN & SONS

Manufacturers of Copper Boilers and Storage Tanks

205-211 First Street
SOUTH BOSTON, MASS.

NEW YORK, N. Y., 511 Fifth Avenue

Products

COPPER RANGE BOILERS.
HOT WATER STORAGE TANKS.
HOT WATER STORAGE HEATERS with Removable Heating Elements.
STEAM JACKETED COPPER KETTLES.
GENERAL COPPERSMITHING; Expansion Joints.
Coils, Copper Floats, etc.
Also Copper and White Metal Sinks.

Gerstein Service

Copper is generally recognized as the most enduring material for water service, especially at high temperatures. The proper handling of this metal during manufacture, however, and the skill and care devoted to the design of copper equipment is of very great importance. Good metal must be thoroughly well handled if its fine qualities are to be realized in the ensuing product.

H. GERSTEIN & SONS are eminently qualified in skill and experience for meeting the high standards of workmanship essential to the copper-smithing craft.

Copper Range Boilers

Gerstein offers a full line of copper range boilers in standardized designs.

Our boilers are thoroughly riveted, soldered, and tested to at least 200 lb. hydrostatic pressure, in addition to a thorough mechanical inspection before shipment.

Gerstein boilers are built to Massachusetts standard regulation for direct or street pressure. Test pressures are carefully supervised to meet the 42½% requirement of working pressure to test pressure. In no case is the test less than 2.36 times the working pressure. Range boilers are furnished—200 lb. test, 85 lb. working pressure; extra heavy 250 lb. test, 106¼ lb. working pressure; and double extra heavy 300 lb. test, 127½ lb. working pressure.

Copper Kettles

H. GERSTEIN & SONS manufacture an extremely substantial line of steam jacketed copper kettles for general process work. These kettles are furnished complete with supports and are of extra heavy construction throughout.

Storage Tanks and Heating Elements

Gerstein storage tanks are built to Massachusetts regulations, or higher test if required. Horizontal tanks may be supported by standard base castings, or may be suspended by adjustable hangers. Vertical

Gerstein Storage Heater

tanks should almost invariably be supported on standard bases.

Heating coils of any desired capacity may be provided in connection with either vertical or horizontal tanks. These coils may be calculated to supply only enough heat to offset radiation losses, or they may be designed to heat the water at any reasonable desired rate.

In specifying coils, the quantity of water and temperature rise (gallon per hour, and temperature of incoming and outgoing water) should be stated, also the steam pressure available for heating.

Gerstein Copper Boiler

Gerstein Copper Storage Tank

Low Pressure Copper Expansion Joints

These joints will efficiently care for expansion up to ¼ in. The flanges or rings being adjustable allow for easy alignment of bolts. Made in two styles, No. 315 and 316. No. 315 has cast iron rings for pressure systems. No. 316 has steel split rings and is especially recommended on high vacuum systems, as its construction provides against collapsing, due to external or atmospheric pressure. Both are furnished face and drilled. In 27 sizes, 4 to 48 in. Sizes 16 in. and smaller up to 25 lb. steam working pressure; sizes 18 and larger, up to 15 lb.

No. 315 Expansion Joint

General Coppersmithing

The Gerstein organization of designers and skilled workmen are especially qualified for executing difficult special work in copper. In many instances our advice in meeting severe conditions by careful design has proven very useful to our customers.

We are prepared to build expansion joints, special boilers, gas heater coils, stills, chemical equipment, fractionating columns and a wide range of other work.

ALSO DISTRIBUTED BY PLUMBING AND HEATING SUPPLY JOBBERS—THROUGHOUT CANADA BY CRANE CO.

Products

FOR THE BUILDING INDUSTRIES:

Water Supply Pumps.
Drainage and Sewage Pumps.
Return Line Vacuum Pumps.
Condensation Pumps.
Caisson Sinking Pumps.
Cast Iron Blow-off and Sump Tanks.

FOR OTHER APPLICATIONS:

Municipal Water Works and Sewage Pumps.
High Pressure Boiler Feed Pumps.
Paper Stock Pumps.
Axial Flow Pumps (capacities to 50,000 g.p.m.).
Special Centrifugal Pumps of all kinds.

The Company

The Economy Pumping Machinery Co. is a pioneer manufacturer of high efficiency centrifugal pumps for buildings. It is constantly improving its products and broadening its field to cover every pumping requirement of the modern building.

The company maintains a corps of engineers

Economy Pumps

who are ready to assist in the solution of any pumping problem. Consultation with Economy engineers frequently reduces the cost of the pumping installation and, at the same time, results in lower operating costs.

Guarantee

All Economy Pumps are guaranteed to deliver the full rated capacity at the specified head. Workmanship and material are guaranteed against defects for a period of one (1) year from date of shipment. In event of such defects we will replace free, f.o.b. our works, such defective part or parts.

Shop Tests

Each pump is tested before shipment and a permanent record made of its capacity and mechanical performance. The results of these tests are always available to the customer so that if at any future date changes are made in the operating head, complete information may be obtained concerning the capacity under the new conditions. The stringency with which the equipment is inspected under test assures the customer of satisfactory operation.

CHECKING LIST FOR CONVENIENCE IN SPECIFYING PUMPS FOR BUILDINGS

I—GENERAL WATER SUPPLY

Wherever city water pressure is inadequate, centrifugal booster pumps should be installed.

- (a) *Overhead Tank Systems* Pages 2-4
Recommended for all commercial and industrial buildings which afford facilities for supporting tank.
- (b) *Pneumatic Systems* Page 5
Recommended for use in residential buildings, apartment buildings and other establishments where the requirements are less than 100 g.p.m.
- (c) *Tankless Water System* Page 6
Recommended where low pressures occur at infrequent periods. Provides booster service with a minimum investment.

II—DRAINAGE PUMPS OR SEWAGE EJECTORS

Used wherever plumbing fixtures are below sewer or where seepage is encountered below sewer level.

- (a) Pumps for handling surface water and other clear liquids Page 8
- (b) Pumps for handling dirty water and sewage. Pages 9-10

III—PUMPS FOR HEATING SYSTEMS

- (a) *Return Line Vacuum System* Page 11
Return Line Vacuum and Boiler Feed Pumps are used where it is desired to accelerate steam circulation at low pressures by maintaining a vacuum on the return line.
- (b) *Air Line System* Page 12
An Air Line Pump is used to remove air from Air Line or Paul System.
- (c) *Gravity Heating System* Page 12
Condensation Pumps and Receivers are used for drainage of radiation below the water line of the boiler and for acceleration of circulation.

IV—MISCELLANEOUS PUMP APPLICATIONS

- (a) *Air Washer Pumps* Page 4
Used to circulate spray water in the Air Washer System. Capacities and pressures are specified by the air washer manufacturer.
- (b) *Brine Pumps* Page 4
Used to circulate brine through the individual boxes or coils of a central refrigerating system. Capacities and pressures are specified by the refrigerator manufacturer.
- (c) *Hot Water Circulating Pumps* Page 4
A small pump is frequently used to keep the hot water in circulation, eliminating cold and hot pockets.
- (d) *Fire Pumps* Page 4
Selection of fire pumps and capacities should be made after consultation with local underwriter.
- (e) *Hydraulic Elevator Pumps* Page 4
Capacity and pressures should be obtained from the elevator manufacturer.
- (f) *Swimming Pool Circulation Pumps* Page 4
Wherever swimming pool water is filtered and re-used, it must be circulated by a pump. Pump should be of the same capacity as the filters and should be capable of discharging against the maximum filter pressure.
- (g) *Drinking Water Circulating Pumps* Page 4
Circulating Pumps are used to maintain uniform temperatures in the drinking water system. The capacity is usually very small—5 to 10 g.p.m. will maintain circulation in a large system. Consumption may be figured at one (1) quart per worker per hour.

PUMP SELECTION FOR WATER SUPPLY SYSTEMS

Determination of Pump Capacity From Curves

- (1) Tabulate the number and type of fixtures.
- (2) Obtain recommended pump capacities for each type of fixture from the curves shown at the right.
- (3) Add these values and multiply by the constant for the type of building under consideration, as found in the table below the curve.

EXAMPLE: 200-room commercial hotel.

Fixtures	Recommended Pump Capacity
200 lavatories	50 g.p.m.
200 water closets	70 g.p.m.
100 bath tubs	45 g.p.m.
25 showers	45 g.p.m.
20 slop sinks	85 g.p.m.
6 urinals	10 g.p.m.
	305 g.p.m.

305x.80 (Multiplier for commercial hotels) = 244 g.p.m.
the required pump capacity.

Note: These recommended pump capacities are based on peak requirements and provide for operation of pumps only part of time.

Various conditions found in certain installations may further modify the capacity. For example, if the number of occupants of any building is abnormally large or small for the number of fixtures installed, the water consumption per fixture will be materially increased or decreased.

Determination of Pump Pressure or Head

The pressure or head, which the pump must develop, is made up of the following four factors:

- (1) The height from the pump to the highest fixture.
- (2) The pressure required at the highest fixture.
- (3) Pipe friction.
- (4) Any pressure available on the pump suction, such as city water pressure (to be subtracted from the sum of the other three items).

Note: The above values must be in feet of head. To convert pounds per square inch into feet of head multiply by 2.31.

EXAMPLE: For the 200-room commercial hotel assume—

- (1) 250 g.p.m. capacity.
- (2) Height from pump to highest fixture = 100 ft.
- (3) 15 lb. pressure required at the highest fixture.
- (4) An overhead tank system is used, the piping between the pump and tank being composed of 150 ft. of 4-in. pipe and 6 elbows.
- (5) City water available at pump suction at 20 lb.

SOLUTION:

Height to highest fixture	100 ft.
Pressure on highest fixture (15x2.31)	35 ft.
Friction through 150 ft. 4-in. pipe and 6 elbows (10 + 6) (see pipe friction table on next page)	16 ft.
Total required head	151 ft.
City water pressure (20x2.31)	46 ft.
Required pump pressure	105 ft.

Selection of Pump

Turn to page 4 for the pump selection table. The recommended pump for this job is No. SA-73, 3-in. double suction pump with a 15-hp. motor.

Note: If smaller piping had been used the friction loss would be more, necessitating a larger size of pump and motor besides increasing the power costs. The proper selection of pipe sizes is essential for an efficiently designed water system.

Type of System

Overhead Tank Systems—Are recommended where the required pump capacity exceeds 100 g.p.m. The tank capacity should be from 20 to 40 times the pump capacity in g.p.m. For the job in the above example, having a pump capacity of 250 g.p.m., the tank capacity would vary from 5,000 to 10,000 gallons. In a more elaborate type of system both pump and tank are installed in duplicate. The tank should be located a sufficient height above the highest fixture to give the required pressure to that fixture (2.31 by required pressure). For buildings over 25 stories in height, it is advisable to have storage tanks at intermediate points in

PUMP CAPACITIES REQUIRED TO SERVE VARIOUS PLUMBING FIXTURES

Multipliers for Use with Above Chart

Apartments50	Public Comfort Stations	2.00
Apartment Hotels60	Golf Clubs (showers only)	3.00
Commercial Hotels80	(other fixtures)	1.00
Office Buildings (without heavy peak loads)60	Factories (no process water)	1.50
(With peak loads or with a large number of occupants per fixture)80	Female	1.00
		Male	1.00

order to avoid excessive pressure as well as to provide for more efficient pumping. The pumps recommended for Overhead Tank Systems are listed in the table on page 4. The tanks are furnished by either the plumber or general contractor.

Pneumatic Systems—May be used for capacities less than 100 g.p.m. (Such systems are frequently used for larger capacities, but are recommended only where the appearance of the building or some structural difficulty would prevent the use of an overhead tank.) Where these systems are used the pump manufacturer furnishes the entire system complete. For a list of units and installation diagrams of these systems see page 5.

Tankless Systems—Should be used only in small buildings or where the pump is required to operate only at frequent intervals. For this service they are both reliable and practical besides being the least expensive system. The pump manufacturer usually furnishes the entire system complete with automatic controls. See page 6 for a table of recommended pumps and installation diagram.

Circulating Pumps for Hot Water Supply Systems

Circulation—Is usually by gravity with acceleration by means of a pump which prevents the forming of cold and hot pockets in the system.

Capacity—Approximately 20% of the capacity of the main supply pump (cold water pump).

Pressure—Only from 10 to 20-lb. pressure are needed for circulation, but the pump must be designed to withstand the maximum pressure in the system.

ECONOMY WATER SUPPLY PUMPS

The Economy line includes all types of single and multi-stage pumps for clear liquids.

Capacities of the various styles overlap so that it is possible to select five or six pumps for identical conditions. All will operate satisfactorily, but with varying efficiencies and differences in costs.

In order to avoid confusion from multiplicity of types, we are showing tables which list only one style of pump for each capacity and power cost. This table gives type of pump which we con-

Type MS, Large Capacity

sider most practical for the given condition.

Complete information on alternate types of equipment for every capacity are available from our nearest district office.

All of the pumps shown in the table are of sturdy mechanical construction and improved hydraulic design which insure satisfactory service with low maintenance. Their use insures noiseless and efficient handling of the water supply.

DETAILS OF CONSTRUCTION

Economy Clear Water Pumps

The description below will show principal differences in construction between the various types listed in the tables.

	Type DS Double suction pumps	Type MS multi-stage pumps		Type SS Single suction pumps
		Small capacity, 10-70 g.p.m.	Large capacity, 80-400 g.p.m.	
CASING	Casing is split horizontally with pipe connections in the lower half so that interior is accessible without breaking pipe connections. Castings are of alloy gray iron. Mechanical design is simple and rigid; feet are of ample size to hold the pump firmly. The two halves dovetailed to insure alignment.	Casing is of alloy cast iron vertically split and held together by through bolts. Each section is registered to insure alignment. Careful design gives good efficiency even at these small capacities.	Casing is horizontally split. Suction and discharge nozzles are both located in the lower half casing. Interior is accessible without breaking pipe connections. Castings are of alloy cast iron. A volute in every stage, together with the solid bronze diaphragms, makes possible unusually high efficiency.	Casing is vertically split with both pipe connections in the stand side of the case. This design is well adapted for pumps of small capacities. The end plate may be removed for access to the pump exterior without breaking the pipe connections, a feature which gives the same accessibility as the horizontally split case design.
IMPELLERS	Impellers are bronze, one piece castings machined all over and the interior hand-filed. They are double suction type with renewable bronze case wearing rings, which fit closely around the hub. Every impeller is carefully balanced, keyed to the shaft and locked in position between two shaft sleeves.	Impellers are bronze enclosed single suction machined all over, hand-filed on the interior and balanced. The entire assembly locked between shoulders and nuts.	One piece bronze castings machined all over; interiors hand-filed and the impeller accurately balanced, single suction enclosed non-overloading design. Each impeller is keyed to the shaft and locked in place between shoulders and nuts. Case wearing rings are of bronze.	Impellers are bronze enclosed single suction machined all over, hand-filed on the interior and balanced. The entire assembly locked between shoulders and nuts.
BEARINGS	Two renewable bearings are used on opposite sides of the case. They are mounted in split brackets with large oil wells. Special precautions have been taken to exclude dirt from bearing and to prevent escape of oil. Ball thrust bearings are used on the high speed pumps.	Ring oiling, renewable bronze sleeves, mounted in brackets with large oil reservoir which insures ample supply of cool oil at all times. Mounting designed to prevent entrance of dust and water, and to retain oil. Two bearings are used on opposite sides of the pump case.	Bearings are renewable ring oiling, babbitt lined sleeve type, mounted in split housings. Oil reservoirs are designed to return the warm oil to the bottom of the well so that an abundance of clean, cool oil is always available at the ring.	Outboard, deep groove ball bearing mounted in dust-proof housing; grease lubricated. Bearing carries both thrust and radial load. This bearing operates in conjunction with bronze renewable stand bearing, located on the interior of pump case. Both bearings on the driving side of the unit.
SHAFT	Shafts are of nickel alloy steel of ample size to transmit the maximum power required. They are turned, ground and threaded to precision limits. Shafts are encased in bronze sleeves extending through the stuffing boxes.	Shaft is of nickel alloy or stainless steel, of ample size. It is turned, ground and threaded to precision limits.	Shaft is of nickel alloy steel, turned, ground and threaded to precision limits. It is of ample size to transmit maximum power. All portions of shaft coming in contact with the water are encased in bronze shaft sleeves.	Medium carbon open hearth steel turned and ground with threads chased in lathe. Impellers and ball bearing assemblies are held in place between shoulders and nuts.

CAPACITY TABLE

Horizontal Centrifugal Pumps for Clear Liquid

See previous page for description

Uses

Water Supply (Overhead Tank).
Air Washer Circulation.
Brine Circulation.
Swimming Pool Circulation.

Hot Water Circulation.
Hydraulic Elevator.
Drinking Water Circulation.
Tank Filling.

Also for pneumatic and tank-less water systems in the combinations shown on pages 5 and 6.

Multi-stage Single Suction
Centrifugal Pumps,
"MS" Type

Single Stage Double Suction Cen-
trifugal Pumps, "DS" Type

Single Stage Single Suction
Centrifugal Pumps,
"SS" Type

This table shows only one type of pump for each head capacity condition; frequently several types are available. We have, therefore, shown only the type which our experience indicates to be the

most suitable for the average job. Our district offices will be glad to submit complete information on alternate types and sizes for any capacity.

Unit No.	Capacity gallons per minute	Total head in feet water	Size discharge and type of pump	Number of stages	Motor hp.	Approximate floor space, in.	Unit No.	Capacity gallons per minute	Total head in feet water	Size discharge and type of pump	Number of stages	Motor hp.	Approximate floor space, in.

PNEUMATIC WATER SYSTEMS

For convenience of selection, we are listing on this page pumps complete with all necessary equipment (not including piping) for Pneumatic Water Systems.

The pumps listed with these systems are the same as shown in the table on page 4 and as described on page 3.

Selection

In order to select the system required for an apartment or residential building, it is only necessary to count over the number of fixtures and select the unit listed for the desired pressure boost. (If the building is other than an apartment or similar building reference should be made to the table of multipliers shown with the curve on page 2. These multipliers will indicate whether a larger or smaller system is required.)

Specifications

The table below gives all the necessary data for the specifications, it being only necessary to specify whether single or duplex units are desired and the current characteristics of the motor.

Floor Space

In figuring the floor space required, it will be necessary to provide space for the pump, tank and air compressor; the location of each piece of apparatus may be arranged to suit the space available. Smaller tanks may be stood on ends to save space.

Apparatus Furnished

The complete equipment consists of pump, driving motor, pressure gauge, pressure regulator, automatic starter, relief valve, tank, cork and wood base for the pump, rubber connections, air compressor and water gauge for tank.

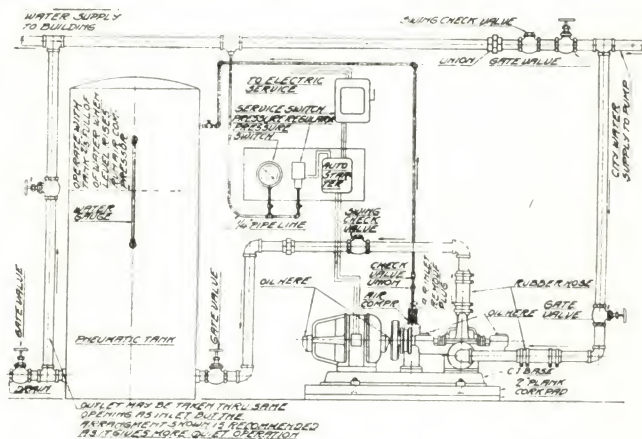

If it is desired to reduce the cost of the apparatus to a minimum, the air compressor may be driven from the pump motor. In this case, one-half of the pump coupling is arranged to form a pulley over which a belt is slipped whenever it is desired to replenish the air in the tank.

Duplex Units

The Duplex Unit consists of two pumps and motors, duplex control, panel and accessories, but only one tank and one air compressor.

Properly Engineered

Economy Pneumatic Water Systems are properly engineered to give satisfactory service. The rubber pump connections, vibration absorbing foundation, and other accessories have been selected after careful experimentation. They are marketed on the basis of performance and not upon extravagant claims or fantastic nomenclature.

Single Pneumatic Water System

Double Pneumatic Water System

TANKLESS WATER SYSTEMS

Uses

In apartments or similar buildings where shortage of water may occur for only short periods. In such installations the tankless system is used to boost the pressure during the period of low pressure.

Tankless systems are also used for special applications where the demand for higher pressure is continuous, but for only a short period each day. Golf courses, amusement parks, race tracks and some industrials are examples. They have heavy demands for water for short periods. Tankless systems are frequently used in such places for boosting pressure obtained from overhead tanks or other source of supply.

As might be expected the tankless system is the cheapest type of booster system. It is thoroughly satisfactory when properly applied, but is not recommended for buildings such as hotels which have a twenty-four hour demand for water.

Equipment Furnished

Pump and motor, automatic starter, panel with pressure regulator, suction and discharge pressure gauge, rubber connections and vibration absorbing base. All piping and valves are furnished by the plumbing contractor.

Tankless Water System

Types of Pumps Used

The pumps used in Economy Tankless Water Systems are of the same high grade construction as is used in the overhead and pneumatic systems. The only difference in the systems is the omission of the tanks and air compressors.

Selection

For apartments and similar buildings it is only necessary to count over the total number of fixtures and select the system listed for that number of fixtures. For other types of buildings select a larger or smaller system as indicated by the table of multipliers, shown with the curve on page 2.

ECONOMY CAISSON SINKING PUMPS

Capacities up to 1000 Gal. Per Min.—Heads up to 300 Ft.

Caisson Pumps are used in construction work wherever shafts must be sunk through wet soils or gravel.

They were especially developed for foundation work in the lake regions where caissons are sunk 100 to 125 ft. to bed rock. They are also adapted to cofferdam work, mine sinking, etc. They have proved themselves one of the most useful types of equipment for the Excavating Contractor. They not only handle the accumulated water, but also pump a large amount of material which would otherwise be removed by other means. In fact, it is not unusual to see two men shoveling sand from the discharge outlet of a 3-in. pump.

These pumps have been used, to the exclusion of all others, on many of the country's largest construction projects. They are made in a large variety of sizes and weights which make

them adaptable for all kinds of construction drainage.

Their shape is such that they fit between narrow ledges and into shafts of small diameter.

SELECTION OF DRAINAGE AND SEWAGE PUMPS

Types and Application

STANDARD SUMP PUMPS FOR SUBMERGED INSTALLATIONS

For drainage applications where the water is free from large solids.

NON-CLOGGING SUMP PUMPS FOR SUBMERGED INSTALLATIONS

For ordinary domestic and industrial sewage without the use of a strainer.

OPEN SHAFT PUMPS FOR DRY CHAMBER INSTALLATIONS

For handling unscreened sewage in the more elaborate type of public buildings.

Determination of Pump Capacities

Capacity for Seepage

Where seepage is to be handled an estimate must be made of the area to be drained and the maximum rise of water in any given length of time. A cubic foot contains $7\frac{1}{2}$ gallons. This figure can be used in computing pump capacity. For instance: an area 50×25 ft. fills with water to a depth of 6 in. in one hour during the heaviest rainfall. It is desired to keep this area dry.

$$50 \times 25 = 1250 \text{ sq. ft.} \times \frac{1}{2} = 625 \text{ cu. ft.}$$

$$625 \times 7\frac{1}{2} = 4688 \text{ gals. approx.}$$

The pump operating continuously and keeping this area dry must have a capacity of 4688 divided by 60 minutes, or 78 gallons per minute. Under flood conditions pump would operate continuously, but at all other times operation would be occasional.

Capacity for Sewage

The pump capacity which should be allowed for various fixtures is given below. These allowances are based upon the frequent use of all the different fixtures, such as would be the case in hotels, railroad depots, office buildings, etc.

Water Closets	6 g.p.m.
Urinals	5 g.p.m.

Lavatories	5 g.p.m.
Bath Tubs	5 g.p.m.
Shower Baths	8 g.p.m.
Slop Sinks, etc.	15 g.p.m.
Half Inch Hose Connections	5 g.p.m.
Automobile Wash Racks	15 g.p.m.
Floor Drains	5 g.p.m.

Example: Assume a job having the following fixtures draining into the pump pit:

6 Closets at 6 g.p.m.	36
6 Lavatories at 5 g.p.m.	30
2 Shower Baths at 8 g.p.m.	16
1 Sink at 15 g.p.m.	15
2 Half Inch Hose at 5 g.p.m.	10

Pump Size 107 g.p.m.

The above is the required capacity if no provision need be made for seepage. A pump should, therefore, be selected having a capacity of from 100 to 150 g.p.m. against a head equal to the difference in elevation between the low water level in the pump pit to the highest point of the pump discharge, plus the pipe friction.

In some buildings such as warehouses, private apartment houses, etc., where the number of occupants are few compared to public buildings, capacity may be scaled down from figures given above.

Determination of Head

The head given in the table is the total obtained by taking the distance from the low water level in the sump to the highest point of discharge, and adding to it the friction in the intervening piping.

For example: Consider a pump having a capacity of 150 g.p.m. installed in a sump 5 ft. deep and discharging into a sewer line 20 ft. above the pump

floor level through a discharge pipe 150 ft. long and 4 in. in diameter.

Total head = 4 ft. (depth of lowest water level in sump) + 20 ft. (static head) + 4 ft. (friction through 150 ft. of 4 in. pipe, as determined from standard friction table) = $4 + 20 + 4 = 28$ ft. total head.

Determination of Basin Size

It is advisable to make the basin size as large as practicable for the individual job, but under no circumstances should the basin be so small that the operation of the pump will be less than two minutes. In other words, the contents of the basin or sump between high and low water level should be approximately twice the capacity of the pump in gallons per minute. In selecting the depth it must be remembered that the high water level must be somewhat lower than the lowest drain and that the low water level will be approximately one foot above the bottom of the basin. The correct basin depth will, therefore, be the distance between high and low water level plus the distance from the floor to the lowest drain or inlet, plus one foot.

For example: Consider a 150 g.p.m. pump having the lowest drain two feet below the floor level. A pump of this capacity requires approximately 300 gallons storage. If a 48-in. basin is used having a capacity of 94 gallons per foot of depth the distance between high and low water level, to give the proper

storage, will be $300 \div 94 =$ approximately $3\frac{1}{4}$ ft. To this depth must be added 2 ft., the distance to the lowest drain and 1 ft., pump clearance at the bottom of the basin, giving us a total depth of $6\frac{1}{4}$ ft. Either a basin 6 ft. in depth or $6\frac{1}{2}$ ft. in depth should then be used. If a larger diameter basin is used the depth will be less, while if a smaller basin is used the depth for the required capacity will, of course, be greater.

CAPACITIES OF BASINS IN GALLONS

Basin depth,* in.	Basin diameter, in.							
	24	30	36	42	48	54	60	72
30	59	92	132	180	235	298	368	528
36	71	110	158	216	282	358	441	632
42	82	129	185	252	330	417	514	740
48	94	147	211	288	376	477	588	844
60	118	184	264	360	470	595	735	1056
72	141	221	317	432	565	715	882	1268
96	188	294	423	576	753	954	1175	1692
120	235	368	528	720	940	1190	1470	2112

*To this depth must be added one foot at bottom for pump and floor clearance, plus the depth of lowest inlet. If the lowest inlet is 12 in. down, then 24 in. must be added to the depth required to give the required capacity in gallons.

ECONOMY STANDARD SUMP PUMPS OR EJECTORS

For Clear Seepage*

Capacities Up to 350 Gal. Per Min.—Heads Up to 100 Ft.

Single Unit

Standard Sump Pumps are used for handling clear seepage and screened sewage.

They are ruggedly built with many refinements of mechanical design. Renewable bronze bearings with high pressure grease lubrication, ball bearing driving heads with built-in motors, turned and ground shafts, guided floats and cover plates separable from pump are only a few of the many features found in the Economy design.

All motors operate at conservative speeds and ratings. Proper overload protection is provided. Every pump is tested before shipment.

The installation may consist of one or more pumps in a single sump. A duplex set of pumps is frequently installed when there is danger of heavy overload or floods which would tax the capacity of a single unit. In a duplex unit, one pump is always in reserve for emergencies. Under normal conditions, the operation of the pumps would be alternated, so that each would be in service only half of the time, thus very materially lengthening the life of the apparatus.

If, at any time, the water level in the sump continued to rise during the operation of one unit, the standby unit would start automatically.

Standard Sump Pumps are of the self-contained or drop leg type designed for easy, simple erection.

Architects' Specifications

Furnish and install where shown on the plans a No. (single or duplex) Economy Standard Sump Pump, having a capacity of g.p.m. against a total head of feet.

The motor current characteristics shall be phase, cycle, volt. The motors and electrical controls shall conform to the National Electrical Code.

Each pump shall be equipped with adjustable radial ball thrust bearings at the motor floor level, bronze renewable guide bearings and bronze impeller. Each pump shall be independently mounted on its motor base plate, and shall be removable without disturbing the basin cover. A complete set of automatic control equipment including float shall be provided for each pump. Float rods shall be of brass. Lubrication to all bearings shall be from a single high pressure gun.

Provide a diameter by deep cast iron pump basin with inch inlets. Cast iron basin cover to be furnished by the pump manufacturers. Provide a swing check valve and a gate valve in the discharge from each pump.

The manufacturers shall guarantee the capacity and efficiency of the pump as well as its mechanical operation.

*When any of the above pumps are used on sewage a strainer bucket must be specified for each inlet.

See next page for non-clogging pumps

ECONOMY NON-CLOGGING SUMP PUMPS OR SUBMERGED TYPE SEWAGE EJECTORS

Capacities Up to 3000 Gal. Per Min.—Heads Up to 65 Ft.

Single Unit

Non-clogging pumps are used for drainage which contains solids or sewage. They are made in larger sizes and of somewhat more elaborate construction than the Standard Sump pumps. Capacities less than 100 g.p.m. are not listed because smaller capacities do not permit the use of waterways sufficiently large to pass solids.

All sizes are equipped with shaft sleeves and lower bearings which extend around the impeller hub. This construction lowers maintenance cost and increases the life of the apparatus.

These pumps are built both as single and duplex units. Mechanically they are of the same general design as the Standard Sump Pump, except that they are built sturdier and stronger throughout to resist the strain which may be thrown on the parts when solids enter the pump.

Size of Solids Handled

- 3-in. SSV—2½-in. spheres
 4-in. SSV—2½-in. spheres
 6-in. SSV—3¾-in. spheres
 8-in. SSV—5 -in. spheres
 10-in. SSV—7 -in. spheres
 12-in. SSV—9 -in. spheres

Occasionally piping is not large enough to handle solids passed by the pump. In this case trash screens should be provided.

Architects' Specifications

Furnish and install where shown on the plans a No. (single or duplex) Economy Non-Clogging Sump Pump, having a capacity of g.p.m. against a total head of feet.

The motor current characteristics shall be phase, cycle, volt. The motors and electrical controls shall conform to the National Electrical Code.

Each pump shall be equipped with adjustable radial ball thrust bearings at the motor floor level and bronze renewable guide bearings lubricated by a high pressure gun. The impellers shall be of bronze, two-blade, wide waterway type, designed to pass rags, stringy material, etc., without clogging. Each pump shall be independently mounted on its motor base plate, and shall be removable without disturbing the basin cover. A complete set of automatic control equipment including brass float shall be provided for each pump. Float rods shall be of brass.

Provide a diameter by deep cast iron pump basin with inch inlets. Cast iron basin cover to be furnished by pump manufacturer. Provide a swing check valve and a gate valve in the discharge from each pump.

The manufacturer shall guarantee the capacity and efficiency of the pump as well as its mechanical operation.

*Sump diameters for these larger sizes must be proportioned for the individual job. The sumps should be of sufficient size to permit 10 to 15-minute flow from sewers between pump operation.

ECONOMY NON-CLOGGING DRY CHAMBER PUMPS OR SEWAGE EJECTORS

Uses

For the ejection of drainage which contains solids or sewage. Their function is the same as that of the submerged non-clogging pumps described on page 9. They are used in the more elaborate type of building where first cost is not a major consideration.

Advantages

These pumps are not submerged in the sewage, but are accessible during operation and naturally are favored by attendants because of easier inspection and maintenance.

Design

Pumps are of full ball bearing type, adjustable for wear without disassembling. Hand holes are provided in both suction and discharge for inspection of interior; shock bearings and shaft sleeves are provided in the interior of the pump.

Types of Installations

Two types of installations are offered. One has the sewage receptacle located between the pumps (type CB) and the other type consists of a single large tank divided vertically in the center, one half housing the pumps and the other half housing a sewage receptacle (type OB).

Both types of apparatus are factory erected and knocked down for shipment.

Type OB

This is the most popular dry chamber design as it combines accessibility with the maximum capacity of wet or sewage chamber.

Type CB

This type of installation affords maximum accessibility as the pumps are conveniently located at the sides of the sewage receptacle.

Equipment Included

With either type of installation the following equipment is included:

- (1) Pumps
- (2) Tank
- (3) All necessary valves and piping from the sewage tank to the pumps and up to the floor level.
- (4) All electrical apparatus including suitable panel board, high water alarm, etc.

Architects' Specifications

Furnish and install where shown on the plan a No. Economy Open Shaft Vertical Dry Chamber, Non-clogging Ejector, Type OB or Type CB, having a capacity of g.p.m. when discharging against a total head of feet at a speed of r.p.m.

The motor current characteristics shall be phase, cycle, volt. The motor and electrical control shall conform to the National Elec-

Close-up of Pump Unit
Used in Dry Chamber
Installations

trical Code and shall be complete with overload and under-voltage protection.

The pump shall be suitable for handling sticks, stones, rags and raw sewage without clogging. The impeller shall be of bronze, two blade, wide waterway type. The rotor assembly shall be carried in two widely separated radial ball bearings mounted in a tight housing with provision for grease lubrication from the driving floor level. A bronze shock bearing shall be provided at the impeller hub to prevent shaft deflection in case of stones or other heavy objects entering the impeller. The suction elbow shall be of the cast iron flanged type with a large clean-out opening for removal of any solids which enter the suction piping and are too large to enter the pump. The pump shall be filled and painted in Duco before shipment.

The manufacturers shall guarantee the capacity and efficiency of the pump as well as its mechanical operation.

Type CB Center Tank Ejector

TABLE OF CAPACITIES COVERING BOTH
TYPE CB AND TYPE OB

Pump number	1	2	3	4
Capacity g. p. m.	150	250	350	500
H. P. at 15' head	2	3	5	5
H. P. at 25' head	3	5	5	7½
H. P. at 40' head	5	5	7½	10
H. P. at 60' head	7½	10	15	20

Wet well capacity gallons per foot of depth below inlet	Type CB	53	72	94
	Type OB	188	188	188
Size discharge duplex unit	4	6	6	8

Sump should be of sufficient size to permit 10 to 15 minute flow from sewers between pump operations.

Cross Section and Plan of Duplex
Steel Tank Ejector Type OB

ECONOMY HORIZONTAL NON-CLOGGING PUMPS

Capacities up to 3000 Gal. Per Min.—Heads up to 60 Ft.

Horizontal Sewage Pumps may sometimes be substituted for Vertical Dry Chamber or Submerged designs.

They offer the advantage of accessibility, but are not always suitable for building use because of floor space or because of high suction lifts. They are extensively used in buildings located on the sides of hills, in subdivisions, municipal sewage pumping plants and other installations where peculiar conditions justify their use.

They are equipped with the same efficient non-clogging impellers as are used in the Vertical designs. Hand holes are provided for access to the interior of the pumps. Shock bearings are provided around the impeller hub. Double outboard ball bearings carry the normal load.

Architects' Specifications

Furnish and install where shown on the plan Economy Horizontal Non-clogging Pump having a capacity of g.p.m. when discharging against a total head of feet at a speed of r.p.m.

The motor current characteristics shall be phase, cycle, volt. The motor and electrical control shall conform to the National Electrical Code and shall be complete with overload and undervoltage protection.

The pump shall be suitable for handling raw sewage without clogging. The impeller shall be bronze, two blade, wide waterway type. The weight of the shaft and impeller shall be carried on two widely separated anti-friction bearings of the self-aligning type. They are to be enclosed

in split dust-proof housing, designed for grease lubrication.

The suction fitting shall be flanged with a large clean-out for removal of any solids which are too large to enter the pump. The pump shall be filled and painted with Duco before shipping.

The manufacturers shall guarantee the capacity and efficiency of the pump as well as its mechanical operation.

PUMPS FOR HEATING SYSTEMS

Return Line Vacuum Pumps

Uses

These pumps perform three duties:

- 1—Remove air from the heating system
- 2—Maintain a vacuum on the return main, thus accelerating circulation at low pressures
- 3—Return condensate to the boiler

All Hoffman-Economy Vacuum Pumps are capable of establishing a maximum vacuum of 24 in. in the smaller sizes, and higher in the larger sizes. This makes them particularly adaptable for use on automatically fired systems where there is a possibility of a high induced vacuum on the boiler.

They are capable of handling water almost at the boiling point.

Standard Equipment

The units come complete, ready to run, including full automatic control for both vacuum and float operations, built-in accumulator tank, vacuum gauge, strainer, water level gauge, etc.

Single Return Line Vacuum Pump

Duplex Units

Description

Duplex Units are of the same general design as a single unit and consist of one tank, one float switch, two pumps, two motors and two vacuum regulators. Each pump is valved.

Easy to Install and Service

Return inlet centre lines are located 8½ in. to 15½ in. above floor; in the majority of installations it is possible to have water returned by gravity, whereas with other pumps lift fittings or pit would be required.

All operating parts are readily accessible.

Duplex Return Line Vacuum Pump

For complete description, outline dimensions, etc., see Index for Hoffman-Economy Pumps

Low Pressure Condensation Pumps

Uses

For drainage or radiation below water line and for acceleration of circulation in low pressure gravity heating systems, vapor systems, etc.

Description

The unit consists of a pump, motor and receiving tank with float control, which starts the pump whenever the water level in the tank rises. The unit is sturdily and compactly designed and assembled on a cast iron base. The pump is of the enclosed impeller, bronze fitted type with both suction and discharge connections in stand side of the case. Access may be had to the impeller and other working parts without breaking any pipe connections.

Vertical Underground Pumps and Receivers

Uses

On gravity heating systems, where returns are located below floor level or otherwise too low for horizontal pumps.

Installation

Cast iron receiver is installed below floor and is cemented in, flush with floor. No provision need be made for access to tank. All apparatus is removable through the cover.

Duplex Unit

Duplex unit consists of two pumps, two motors and two sets of automatic control installed in a single tank.

Description

Pumps are special vertical centrifugals with enclosed bronze impellers of the non-overloading type. The upper shaft bearing is of the ball bearing type mounted in dust-proof housing; lower bearing is self-lubricated and is easily renewable without moving impeller from shaft or dismantling pump; shaft is protected in lower bearing by renewable sleeve, turned, ground and locked to shaft.

Underground Pump

Medium Pressure Condensation Pumps

Uses

In laundries, cleaning and dyeing plants, greenhouses, textile mills, power plants, etc., where it is desired to return condensate to medium and high pressure boilers or heaters.

Advantages

Motor driven pumps have a great advantage over steam pumps, as they operate at either high or low pressure. This is a great advantage where fires are banked at night, or over the week end. Where steam pumps are used, it is always necessary to maintain sufficient pressure for pump operation. This consumes a great deal of fuel which would be saved if pressure were allowed to drop during shut-down periods.

Description

The assembly is very similar to that of the low pressure pumps described above except that a bronze fitted high pressure multi-stage pump is used in place of the low pressure pump.

Medium and High Pressure Condensation Pump

MEDIUM AND HIGH PRESSURE PUMPS AND RECEIVERS

Unit No.	Capacity in sq. ft. direct C. I. rad. or equiv.	Capacity in lb. condensate per hour	Pump capacity gal. per minute	40 lb. discharge pressure Motor hp.	60 lb. discharge pressure Motor hp.	100 lb. discharge pressure Motor hp.	175 lb. discharge pressure Motor hp.

The above is a condensed table. Complete range of sizes to 300,000 sq. ft. radiation capacity and 400-lb. pressure.

Air Line Vacuum Pumps

Uses

On Air Line gravity heating systems, such as "Paul" systems, the pumps remove air only and do not handle condensate or act as a boiler feed pump.

Description

The pump is extremely simple, consisting only of a horizontal centrifugal pump, circulating water tank and vacuum producer. The pump is bronze fitted with bottom pipe connections arranged so that access may be had to the interior without breaking any pipe connections. Control is full automatic.

Duplex Units

All sizes are made in duplex units, having one tank, two pumps, two motors and two sets of automatic control.

Airline Vacuum Pump

AMERICAN STEAM PUMP COMPANY

Single and Multistage Centrifugal Pumps; Simplex and Duplex Steam Pumps

BATTLE CREEK, MICHIGAN, U. S. A.

NEW YORK OFFICE, 17 Battery Place

CHICAGO OFFICE, 926 Monadnock Building

SALES AND SERVICE AGENCIES THROUGHOUT THE WORLD

Products

CENTRIFUGAL and STEAM PUMPING EQUIPMENT of all types, including:

Centrifugal Pumps (Ball Bearing) Single Stage, Split Case, Bulletins 61 and 64.

Centrifugal Pumps, Single Stage, Split Case, Bulletin 38.

Centrifugal Pumps, Multistage, Split Case, Bulletins 44 and 53.

Steam Pumps, Simplex and Duplex, Bulletins 24, 26 and 28.

Automatic Condensation Pumps and Receivers, Bulletins 27 and 32.

Automatic Bilge Pumps and Sewage Ejectors, Bulletin 41.

Also Air Compressors and Jet Condensers.

Centrifugal Pumps

Built both single and multistage, a complete line for low, medium and high heads to meet practically all requirements. Furnished split or solid case, single or double suction, with enclosed or open impellers, for direct drive from motor, turbine, gas engine, etc., and for belt drive. Recommended for all classes of pumping. Special pumps can be furnished for special conditions.

New Type HL (low head) ball bearing pump specially designed for 1750 r.p.m. motor drive, offering unusually high efficiency, and a non-overloading characteristic which permits the use of smaller, less expensive motors. Also new Type HS (high head) ball bearing pump for 3450 r.p.m. motor drive, offering same operating advantages. Both pumps are fully bronze fitted.

Type HBM single stage pumps and all of the multistage pumps are equipped with babbitted, ring-oiling bearings. Special balance piston feature eliminates thrust on multistage pumps.

On all American-Marsh centrifugal pumps, impellers are hydraulically and dynamically balanced.

Type HL Single Stage Ball Bearing Centrifugal Pump

Type HBM Centrifugal Pump

Automatic Bilge Pumps and Sewage Ejectors

Designed for elevating sewage and drainage water from points below sewer levels. Electrically driven and entirely automatic in operation—pump runs only as required to keep water below set level in sump basin.

Built in sizes handling 5 to 500 g.p.m., in both single and duplex types. Simple in design and all parts extra heavy, for dependable service without attention.

Type SFM Automatic Sewage Ejector

Steam Pumps

As one of the largest builders of steam pumps, this company offers a complete line in both simplex and duplex types with sizes in each type to meet all requirements.

Simplex pumps are fully bronze fitted. Steam valve is of the balanced piston type with semi-rotative disc auxiliary valve—no internal stuffing boxes, no tappets or slide valves. Construction extra heavy, resulting in unusually low upkeep cost.

Duplex pumps have special steam ends that insure maximum economy and quiet operation at high speeds. Built with fittings to meet service conditions.

Simplex Steam Driven Boiler Feed Pump

Automatic Condensation Pumps and Receivers

A complete line in both centrifugal and steam driven types with sizes to meet every heating requirement.

Operation entirely automatic, using control equipment which is standard and dependable.

Engineering Service

We welcome inquiries in connection with any pumping problem. Engineering recommendations furnished without obligation. Write for Bulletins.

Large Duplex Steam Driven Boiler Feed Pump

AMES PUMP COMPANY, INC.

90 West Street, NEW YORK, N. Y.

Ames Vacuum Heating Pump

The Ames Pump is *distinctively different* from the average pump used in vacuum heating. It is a unit which develops a *high vacuum*, entrains all the *condensable gases*, has a *liberal air capacity* and discharges all condensate, *regardless of temperature*, to the boiler.

This pump has been designed on the venturi-nozzle principle with a conscientious effort to combine the very best and most modern engineering refinements. It is made in single and duplex units, the latter being preferred since it not only saves space and cost of installation, but provides the all-important feature of a stand-by pump. Control valves permit the dismantling of either pump without disturbing any piping or shutting down the heating system.

Basically, this pump consists of two centrifugal impellers mounted on a single shaft, and a vented dual compartment receiver. The first impeller creates a high vacuum in the suction line and delivers the condensate together with all non-condensable gases into the receiver from which air and gases are vented to atmosphere. The other impeller returns condensate from the receiver to the boiler. Following is given in greater detail a description of the various operations involved, and the special construction of the Ames Pump that makes it distinctively different from others.

Operation—Suction impeller (11) is the essential operating part of this pump. This impeller is constantly submerged in water which flows from chamber (8) through compartment (5) by way of base channel (4). An automatically controlled motor, actuated either by the amount of vacuum in the heating system or by a float switch controlled by the water level in the discharge end of the receiver (7), sets impeller (11) in motion. This discharges a high velocity jet of water across an ejector gap and through spaced stationary diffuser or compression plates which surround the periphery. This forms the most efficient, yet simple and durable, hydraulic high vacuum producing element.

By this vacuum, condensate and vapor in the heating system (1) is drawn through the suction strainer and check valve, compressed through ejector plate (25) into the volute chamber of the pump, and finally is discharged to the upper part of the receiver through manifold passage (6). Here air is separated and vented to the atmosphere, without back pressure, through vent opening (20), and the condensate flows to storage chamber (7).

Ames Vacuum Heating Pump—Duplex Unit

From this chamber the stored condensate flows into the control valve passage (9) which connects to port (10) leading to the revolving boiler feed impeller (14). The condensate is then driven through the discharge line, check valve and finally into boiler feed line (26). There is no vapor binding of boiler feed impeller (14) as this is eliminated by manifold passage (15) which leads to the upper part of chamber (8). Water gauge (16) indicates by plate (24) the level of the condensate in storage chamber (7) required for priming before starting.

On and off switch on control box (19) disengages vacuum regulator while switch on auto starter (18), when placed in proper position, makes float switch ineffective, thus permitting of continuous operation of the unit. To eliminate frequent stopping and starting when on night operation, valve (17) at side of tank is opened.

To operate within the limit of predetermined maximum vacuum desired on the system, vacuum breaker (22) is accordingly adjusted. Vacuum is indicated by compound gauge (21).

Thermometer (27) serves as a valuable aid to ascertain condensate temperature.

The diagram below, while of the duplex unit, differs only from the single unit in that it contains dual-ported control valves. The ports shown closed lead to parallel passages which connect to the companion pump.

Guarantee—Each Ames Vacuum Heating Pump is guaranteed to maintain a vacuum of not less than 5 in. of mercury (referred to 30-in. barometer) with condensate at 200° F. when connected to a heating system that is reasonably free from air leaks, and which is laid out and installed in accordance with American Society of Heating and Ventilating Engineers' standards.

During a period of 3 years from date of shipment, any part or parts, found defective or worn sufficiently to impair the successful operation of the pump, will be replaced free of charge, f.o.b. works, providing claim is promptly submitted in writing to the Company.

Specifications

The following, incorporated in the heating specification, will insure securing a standard Ames Return Line Vacuum and Boiler Feed Unit.

Vacuum Pump—Furnish and erect in space provided by engineer's plans and in accordance with manufacturer's drawing to be approved by engineer:

..... size No.* single (duplex) Ames Vacuum Heating Pump with automatic and manual control.

Each pump shall be of the multi-rotor, centrifugal type, fitted with bronze internal parts, bronze split

*Specify single or duplex.

Flow Diagram of Ames Duplex Pump

stuffing box glands, and Monel Metal shaft with deep-groove, ball bearings, direct connected through all metal lubricated flexible coupling to:

..... hp., current,
..... volt, phase,
..... cycle, 40° C. ball bearing motor.

Each pump shall have a rated capacity of sq. ft. of equivalent direct radiating surface with a water capacity of gal. per min. when discharging against lb. pressure at the unit discharge nozzle. It shall also be capable of maintaining a vacuum of not less than 5 in. of mercury (referred to 30-in. barometer) with condensate at 200° F. when connected to a heating system reasonably free from leaks, and deliver same, regardless of temperature, to the boiler.

A complete unit shall be supplied to include pump, motor, cast iron receiver and air separator tank, protected water gage glass, compound gage, thermometer, vacuum breaker, discharge check valve

Sectional View of Horizontal Split Case Multi-rotor Pump

Data for other pressures on application.

All units guaranteed to produce a vacuum of 24-26 in. if tightness of system and temperature of returns permit. Selection of units must be made on basis of square feet of radiation or equivalent gallons per minute and not pump capacity.

and self-cleaning strainer.

The unit shall be assembled complete with pump tank and motor mounted on one heavy cast iron base having raised edge at top, screened drain pocket tapped for drain connection, foundation grout holes and levelling bolts.

Suction, discharge, and air vent shall be provided with companion flanges, bolts, nuts and gaskets.

Dual electric control shall be included and shall consist of *vacuum regulator* with *on and off switch*, and *float* with *float switch* controlling an *automatic starter*. Starter shall also be equipped with *manual control* to permit *continuous operation*. All equipment shall be enclosed, wired and conveniently mounted on receiving tank by the pump manufacturer.

The pump manufacturer shall guarantee to the building owner the pumping equipment against wear for a period of 3 years from date of shipment.

General Catalogue filed under A.I.A. No. 29d5.

"Automatic Alternator" (Patented)

The "Automatic Alternator" is a simple mechanical device
which automatically alternates the operation
of any duplex set of electric motor driven
pumps.

The Alternator supplants the conventional
four-pole double throw transfer switch generally
used to manually alternate duplex pump
units.

The Alternator automatically transfers the
operation from one pump to another, thereby
equalizing the wear on both pumps, and increasing
the life of both pumps.

It prevents rusting of idle pump, thereby
avoiding constant blowing of fuses, and possible
burning out of motors and starters.

It keeps both pumps in good running
order, thereby maintaining a much higher effi-
ciency, and saving operating expenses and repair
bills.

Bulletin 142 gives complete information and
specifications.

Fig. C-73
Automatic
Alternator

"Little Giant" Automatic Electric Cellar Drainer

The "Little Giant" is a small bilge
pump made primarily to drain cellars.
"Little Giant" is complete including
cord and plug for connecting to light
socket. Fig. 1870 is provided with
tripod legs for standing on cellar
floor. Fig. 1871 is provided with a
floor plate for use with a basin.
Either style is portable and may be
transported from place to place.
Either style will fit in a 3-ft. deep
tile, 15 in. in diameter where Fig.
1870 is used, and 12 in. in diameter
when Fig. 1871 is used.

"Little Giants" are as thoroughly
and precisely built as the big "Chi-
cago" Pumps. Full ¼ hp. motors
are used. Orange helmet protects motor from dam-
age. Switch is simple and positive. Flexible cou-
pling connects motor to pump shaft. Shaft is covered from
top to bottom. Three bearings insure smooth operation.
Bronze impeller is of the non-overloading type.

CHICAGO PUMP COMPANY manufactures a complete line of
bilge pumps in single and duplex. Capacities range from
15 to 2000 gal.—motors at speeds of 870, 1140, 1425, 1725 r.p.m.

Bulletins 119, 120 and 122 give complete information and
specifications.

"Flush-Kleen" Sewage Ejector with Self-cleaning Strainer

Fig. 2045
Duplex "Flush-Kleen" Ejector,
Dry Basin Type

too great for one pump to handle, the second pump automatically cuts in. Made with square or round basins, either submerged or dry basin type. *Bulletin 125 gives complete tables, layouts and specifications.*

Three Major Claims for "Flush-Kleen" Sewage Ejector—(1) The "Flush-Kleen" Sewage Ejector will discharge larger and heavier materials than other ejectors of similar size and horsepower.

(2) The "Flush-Kleen" Sewage Ejector will pump successfully into the sewer any sewage or foreign material which can run into basin from sanitary waste lines.

(3) The "Flush-Kleen" is equipped with an "Automatic Alternator." This operates first one pump and then the other. It is the only device of its kind, and is manufactured solely by CHICAGO PUMP COMPANY.

Rags, Sticks, Papers, Cannot Clog a "Flush-Kleen"—Sewage Never Touches the Impeller—The "Flush-Kleen" Sewage Ejector eliminates the objectionable work of emptying and cleaning strainer baskets. Sewage is automatically strained as it enters the basin. Strainer is cleaned on each operation of pump by a reversal of flow in the discharge pipe. Sewage may flow into basin continuously whether pumps are idle or operating. When the inflow becomes

Fig. 2044
Diagram of "Flush-Kleen" Ejector

Duplex Submerged "Flush-Kleen" Sewage Ejector Specifications

Furnish and install where indicated on plans, one duplex set of CHICAGO PUMP COMPANY's automatic, electric motor driven, Submerged "Flush-Kleen" Type Sewage Ejectors, each ejector to have a capacity of gallons per minute when discharging against a head of feet. Ejectors to be inches heavy duty Sewage Pumps, fitted with individual "Flush-Kleen" strainers employing the flow-reversal principle. Pump shafts shall be fitted with stuffing boxes; also with bronze intermediate bearings if basin depth exceeds 5 ft.

Motors—Pumps to be direct connected by flexible couplings to horsepower, 40 degree, volt, current, 1140 r.p.m. vertical type electric motors. Motors must be capable of operating continuously without undue heating, sparking or sign of overload.

Automatic Control Equipment—Furnish and install near pumps, a duplex automatic control panel arranged for floor mounting and having mounted thereon two enclosed fused, main line switches, and two enclosed type current automatic starters, providing overload and undervoltage protection. Two cast iron pedestals 40 in. in height will be mounted on basin cover.

Automatic Alternator—Provide a CHICAGO PUMP COMPANY's Automatic Alternator which will automatically transfer the operation from one pump to the other. This Alternator shall also start the pump not in service in event of failure of the pump first in service to handle the load.

High Water Alarm—Install a complete self-contained high water alarm which will ring a 4-in. bell in event of failure of pumps or electric motors.

Ejector Basin—Furnish and install a cast iron basin inches in diameter and 48 in. deeper than the lowest inlet entering it. Basin to be provided with a heavy cast iron cover having a 12x18-in. manhole, and necessary openings for pumps, automatic control apparatus, high water alarm and 4-in. vent opening which shall run to stack. All sewage and sanitary waste shall enter the basin through (one) sewage inlet opening.

Pipe Connections—Make connections to discharge fittings of pumps, placing in each discharge line near the pumps, a union, a check valve and a gate valve. The unions to be located nearest the pumps, and the check valves between the unions and the gate valves.

Electrical Wiring and Connecting—The electrical contractor will bring his service to within 10 ft. of pumps and make connections to main line switches. He shall also make electrical connections of the high water alarm transformer which shall be connected with the lighting service of the building, and not with the power service.

"Non-clog" and Standard Sewage Ejectors

CHICAGO PUMP COMPANY's line of ejectors is complete in sizes and styles. There is a line of Standard Ejectors, another line of "Non-clog" Ejectors and still another in "Flush-Kleen" Ejectors. Chicago Ejectors are made up in single and duplex. Capacities up to 3000 g.p.m.

The "Flush-Kleen" line is recommended wherever possible. Its efficiency, dependability and cleanliness as compared with the old-fashioned strainer basket type make it the first choice of all sewage ejectors. (See description above.)

Tables of capacities and horsepowers in next column are accurate for "Flush-Kleen" Ejectors, but can be used to approximate sizes in the Standard and "Non-clog" lines.

Fig. No. 2062
Non-Clog Vertical Pump

Standard Ejectors completely described in Bulletins 122, 123, 128.
"Non-clog" Ejectors completely described in Bulletins 126, 128.
"Flush-Kleen" Ejectors completely described in Bulletin 125.

*Partial list only.

Other tables at motor speeds of 1425 and 1720 r.p.m. for "Flush-Kleen," "Non-clog" and Standard Ejectors gladly furnished on request.

"Condo-Vac" Vacuum and Boiler Feed Pump

"Condo-Vac" Features—(1) "Condo-Vac" has a centrifugal air pump.

(2) Does not depend on close clearances for efficiency. No adjustments are necessary.

(3) Has "sustained efficiency"—uses same amount of power and gives same results, year after year.

(4) Low inlet—10 in. off floor.

(5) Pump casing horizontally split.

(6) Unit is complete, connected up ready to work.

(7) Duplex and single units in sizes up to 100,000 sq. ft. of direct radiation.

"Condo-Vac" Specifications

Furnish and install, where indicated on plans, one CHICAGO PUMP COMPANY'S "Condo-Vac" centrifugal return line vacuum pump and receiver complete with all apparatus necessary for automatic vacuum and float switch control. This equipment shall be [single] [duplex] and shall have a capacity of sq. ft. of direct radiation and shall be capable of discharging the condensate to the boiler against a pressure of lb.

Further complete specifications will be sent on request.

Bilge Pumps

For pumping water out of basements located below the sewer level.

They are fitted with oil lubricated bronze bearings every 4 ft.; self-aligning ball thrust bearing, flexible couplings, a double carbon contact type float switch and a Square D main line switch. All mounted on one pedestal. Automatic apparatus is totally enclosed.

Made in all sizes from 15 to 1500 gal. per minute and in single or duplex.

Duplex Bilge Pump Specifications

Furnish and install where indicated on plans, one duplex set of CHICAGO PUMP COMPANY'S Automatic Electric Bilge Pumps. Each pump to have a capacity of gallons per minute when pumping against a head of feet. Pumps to be fitted with oil lubricated adjustable radial ball thrust bearing contained in a dustproof housing located above floor plate of pump, and intermediate guide bearings every 4 ft. to guide the shaft. Suction of pumps to be fitted with strainer of large area.

Vertical Condensation Pumps and Receivers

Where the piping arrangement requires a pump pit, no longer is it necessary to allot a great amount of space for a horizontal pump.

The Chicago Vertical Condensation Pump is ideal where the returns come back below the floor. Some manufacturers sell ordinary bilge pumps for this class of service, but we recommend an especially designed pump to handle the varying temperatures of the condensate.

Ask for Bulletin 133.

Fig. 1940

Vertical Condensation

Horizontal Pumps

Made in both styles of casings—horizontally and vertically split—in single and multistage. They are manufactured for numerous purposes, including: boiler feed; booster service for hotel, hospital, apartment and office buildings; pneumatic systems (in connection with air compressors); ice water circulating

Fig. No. 1907

Type H-S 6-Stage Pump for High Pressures

ing and hot water circulating, and various Industrial services. Drive may be Electric Motor, Gas Engine, or Steam Turbine.

Complete details and tables in Bulletins 101 and 101A.

Duplex Gravity Tank House Pump Specifications

Furnish and install on concrete foundation where indicated on plans, two CHICAGO PUMP COMPANY's automatically controlled centrifugal house pumps, each having a capacity of gallons per minute when pumping into gravity tank against a head of feet, not including friction and with city pressure figured at not more than pounds at suction of pumps. Pumps shall be CHICAGO PUMP COMPANY's type inch full bronze fitted centrifugal pumps, each mounted on a heavy machine cast iron subbase and direct connected by flexible coupling to electric motor.

Fire Pumps—Electric or Gas Engine Driven, Centrifugal—Underwriters Approved

"Chicago" Fire Pumps were the first ball bearing fire pumps to pass Underwriters' tests. "Chicago" Fire Pumps are approved by National Board of Fire Underwriters and Associated Factory Mutual Fire Insurance Companies as well as State and municipal fire prevention bureaus.

†Limited space does not permit showing medium capacities and heads in 700, 1000 and 1500 g.p.m. Write for Bulletin 101-A for complete engineering data.

"Chicago" Fire Pumps are made in both single-stage and multistage with capacities ranging from minimum of 500 g.p.m., to as large as required. Fire pump fittings as required by Underwriters and local fire authorities are furnished. Illustration shown is that of a typical fire pump with fittings required by the Underwriters.

Fig. 1800

CHICAGO PUMP COMPANY also manufactures a complete line of booster and tank filling pumps as well as gas engine driven fire pumps for subdivisions, villages, factory and auxiliary use. Installation diagrams are furnished for each job by the Engineering Department. Fire, booster and tank filling pumps are described in detail in Bulletin 104.

Underwriters Fire Pump Equipment Specifications

Fire Pump—Furnish and install where indicated on plan, one automatic electric motor driven approved fire pump with all auxiliary apparatus to make a complete fire pump installation.

Pump to be CHICAGO PUMP COMPANY's approved centrifugal fire pump having a capacity of gallons per minute when discharging against a pressure of pounds with city pressure figured at zero. The pump shall be mounted on a heavy cast iron subbase and direct connected by flexible coupling to the electric motor. Mount pump and motor on a concrete foundation of proper dimensions, installing between them in an approved manner, sheet iron splash partition.

Furnish complete automatic and manual enclosed fire pump control panel.

Pump motor, panel and method of installation to conform to National Board of Fire Underwriters, Associated Factory Mutual Fire Insurance Companies, and State and local fire prevention bureaus.

Pneumatic Water Supply Systems

Pneumatic water supply systems are used where it is desired to supply water automatically in any size or style of building without the use of a roof or gravity tank. Apartment buildings, schools, hotels, clubs, mercantile buildings and factories use pneumatic systems where city water pressure is insufficient to supply the building. "Chicago" Pneumatic Sys-

Fig. 2016

Pneumatic Water System

tems can be had with any size pump in either single or duplex systems and are furnished complete with pump, compressor, tank and control apparatus.

Units are made up to provide any desired amount of water at any pressure. Ask for Bulletin 111.

Tankless Systems—Another method of supplying water to buildings is the tankless system. This system is placed in a building where the city water pressure takes care of the requirements under ordinary conditions, but is too low on extremely hot days or at peak load periods. The tankless system is recommended for this periodical service. See Bulletin 113.

CENTRIFUGAL PUMPS of all kinds, including:
Single and Multi-stage, Single or Double Suction
Pumps for Booster and House Service.
Condensation Return Pumps for Heating Systems.
Underwriters' Fire Pumps, single and multi-stage.

Sump Pumps and Cellar Drainers.
Automatic Water Systems for country and sub-urban houses.

Also Reciprocating and Triplex Pumps, High Lift Pumps, Deep Well Pumps, Rotary Pumps, Contractors' Pumps, etc.

CENTRIFUGAL PUMPS FOR BOOSTER AND HOUSE SERVICE

Single Stage, Single and Double Suction

Ball Bearing Type

These are high grade centrifugal pumps for a wide range of capacities, high heads and high efficiencies at medium and high speeds—ratings formerly obtainable only with the more expensive multi-stage pumps. They are particularly suitable for house pumps in hotels, apartment houses and office buildings and as general service pumps.

Construction of these three pumps is similar: Casing is cast iron, divided horizontally, the two castings bolted together; the lower half of the casing also

Fig. 3480. Sectional View of Single-stage, Ball Bearing Centrifugal Pump

contains the suction and discharge nozzles; casing is provided with air cocks and with openings for priming and draining.

The chief features are shown in the accompanying sectional view. They are supplied standard fitted, bronze fitted, all iron, or all bronze.

Figure No.	Pump size, in.	Pipe sizes, in.		Approx. capacity gal. per min.	
		Discharge	Suction	Min.	Max.

3450	*16	16	18	3000	15,000

*Companion flanges not furnished on pumps larger than 12 in.

Sleeve Bearing Type

Sound mechanical design ranks with high efficiency in these pumps which are the result of over 19 years of research and development in the centrifugal pump field.

Features of Construction—(1) Close grained cast iron casing divided horizontally; (2) balanced impeller; (3) ring oiling type bearings with split cast iron shells lined with babbit metal; (4) ball thrust bearings; (5) special alloy steel shaft; (6) extra long stuffing box with brass water seal ring; (7) horizontally split glands adjusted by swing bolts; (8) bronze casing wearing rings; (9) flexible pin-and-buffer type coupling; (10) pump and prime mover mounted on cast iron bedplate with drip canal.

Four constructions same as ball bearing type.

Bulletin No. 200 with Charts

This bulletin will prove invaluable when selecting a single stage centrifugal pump for any condition. It is devoted to those types and sizes which take care of the average pump requirements and contains charts showing the extremely wide range of capacities and heads covered by these pumps. Sent upon request.

MEDIUM PRESSURE MULTI-STAGE CENTRIFUGAL PUMPS—VOLUTE TYPE, SINGLE SUCTION

These pumps are designed for use against very high heads and are therefore suited for use as house service pumps in very high buildings.

Features of Construction

Spiral water passages give free flow of water from suction to discharge without abrupt turns. Due to the construction of the casing, the energy conversion from velocity head to pressure head takes place in the volute itself. High efficiencies are the result.

These pumps have very few so-called sealing surfaces. This reduces the possibility of leakage from high pressure to lower pressure chambers and makes for high continued efficiency.

It is of very simple construction: by removing the upper half of the casing, the entire pump is opened for inspection. The rotating element may be removed and replaced with the same ease as in an ordinary single-stage pump. Wearing rings are held in position by lugs which fit snugly into the casing.

Every wearing surface is protected by a renewable part. It is not necessary to renew or rebore the casing because of wear.

Each impeller is hydraulically balanced. A double acting ball thrust bearing takes care of any unbalancing due to wear.

Two volutes of equal size are placed diametrically opposite each other in each stage. This gives more perfect transformation of velocity into pressure, makes the pump more efficient and results in a strong symmetrical casing.

Types of Construction

Bronze Fitted Pumps—Have single suction enclosed type impellers, casing wearing rings, shaft sleeve water seal rings and bushings of bronze, shaft of alloy steel, heat treated, casing and glands of cast iron.

All-iron Pumps—Have all parts coming in contact with the liquid made of bronze.

Bulletin No. 201 with Charts

Bulletin No. 201 contains invaluable information for selecting a multi-stage centrifugal pump for any condition. It is devoted to types and sizes which will take care of the average pump requirements and contains charts showing the extremely wide range of capacities and heads covered by these pumps. Sent upon request.

GOULDS UNDERWRITERS' FIRE PUMPS

Centrifugal Fire Pumps

Goulds Single and Multi-stage Centrifugal Pumps are built to the specifications of the National Fire Protection Association and have been tested and listed as standard by the Underwriters' Laboratories, Inc., and the Associated Factory Mutual Fire Insurance Companies.

Goulds Centrifugal Fire Pumps can be used to discharge direct into hose lines, or in connection with automatic sprinkler systems. They are built for direct connection to electric motors, gasoline engines or steam turbines.

Fig. 3099. No. 6 1000-gal. Single-stage Fire Pump

Special Fire Pumps

Special conditions often require special fire pump units which are designed and built for each individual installation. Local boards of fire underwriters pass on such units for approval. Unit shown below was approved for 40-story building. It consists of a Fig. 3330, 6-in., 3-stage pump complete with Underwriters' fittings. Capacity 750 g.p.m., 175 lb.; and a Fig. 3330, 5-in., 2-stage pump complete with Underwriters' fittings. Capacity 500 g.p.m., 100 lb.

Operated either singly or in series giving 1250 gal. for low pressure service and 500 gal. for 275 lb. service.

Quotations and full recommendations furnished upon receipt of full information regarding requirements.

GOULDS CONDENSATION OUTFITS

These outfits are designed to handle the condensate from a steam or vapor heating system. They consist of a vertical centrifugal pump mounted on a galvanized iron receiver, a ball float and automatic control switch.

They are exceptionally well built and will give years of satisfaction.

The same material and careful workmanship go into these outfits as into the larger pumps.

The vertical type is superior to the horizontal type because it requires less floor space, is simpler in construction, more positive in operation, requires no concrete pit and when necessary to install below the floor level requires a much smaller excavation.

Features—(1) Compact and self-contained requiring very little floor space; (2) easy to install, the outfits being shipped as complete units; (3) automatic in operation, a dependable float switch starting and stopping the pump automatically; (4) vapor-tight so that they may be used under pressure if desired.

Capacity—These outfits will handle condensation from 10,000 sq. ft. of direct radiation based on ½ lb. of condensation per square foot per hour or 15,000 sq. ft. of radiation based on ⅓ lb. per square foot per hour.

They will discharge 20 gal. of hot water per minute against 17 lb. pressure.

Fig. 3354. Condensate Return Pump and Receiver

GOULDS SUMP PUMPS AND CELLAR DRAINERS

These pumps are designed to elevate to street sewers the drainage in buildings where the basement floors, boilers and elevator pits are below sewer level and for any other service where the liquid to be pumped accumulates in a catch basin, pit or tank. This service requires a pump that is automatic in operation, needs a minimum of attention, occupies little floor space and is of the simplest, most rugged construction.

Goulds pumps fulfill all these requirements. They are made in several types and sizes.

Goulds New No. 3047 Sump Pumps

Goulds new sump pump, using a new type, non-clogging, high efficiency impeller, eliminates pumps requiring large expensive motors and control apparatus. It will permit the use of motors one or two sizes smaller, and in many cases, motors can be used which are only one-half the size generally required by vertical type pumps.

No. 3047 Sump Pump

Non-clogging Impeller— The new non-clogging impeller is the most efficient type yet developed for handling water containing coarse, stringy or fibrous materials.

The two vanes, warped and joined together to make a well rounded, continuous surface at the inlet, provide smoother surfaces, which easily pass any long, stringy or fibrous material without clogging.

Construction— Pumps are constructed of light weight steel with maximum strength. Welded assembly gives permanent, unalterable alignment.

Made in 4 sizes to handle from 20 to 650 gal. per minute against 25 ft. head. Will operate up to 70 ft. head. Motor and automatic float switch are mounted on steel pit cover. Pit cover is of circular or rectangular shape to suit requirements, of "Safety Tread" steel and, on sizes of 40 in. diam. or 36x36 in. square or larger rectangular covers, will include an 11x15 in. manhole with cover. Pit covers have circular openings to accommodate the small pit cover plate and will allow removal of pump and motor unit without disturbing the pit cover.

Pumps arranged for pit depths from 5 to 14 ft. Pump can also be furnished for pit depths of less than 5 ft. and for any intermediate depth up to 14 ft. in accordance with customer's specifications.

Motor and Control— We recommend ordering complete pump, motor and control apparatus. The control mounting bracket will be securely attached to the main pit cover and motor and control will be approximately 2 ft. above the cover.

Motors, float switches, floats, thermal protective cutouts, and magnetic starters for stock motors are carried in stock and shipment of the proper control

**Non-clogging Impeller
Used on All Goulds
Nos. 3047 and 3048
Centrifugal Sump
Pumps**

Heavy duty radial and thrust ball bearing mounted in an adjustable oil and dust sealed housing.

Bearing housing threaded to support pipe. Impeller clearance adjustable to micrometer exactness. Through bolt securely locks housing.

Steel shaft enclosed in steel support pipe. Pipe welded to steel pit cover and flanged at pump casing.

Two non-seizing, non-scoring bronze bearing bushings, grease packed, form long lower bearing.

Lubrication is retained and entrance of grit into bearing prevented by pressure relief chamber.

New maximum efficiency, non-clogging, two-vane, open type impeller with no shaft nut or other projection to obstruct the inlet. Made of bronze to prevent corrosion during prolonged idle periods.

No. 3047 Sump Pump Structural Details

apparatus mounted upon a structural steel motor support, can be quickly made.

No. 3048 Duplex Sump Pumps

For installations where the use of two complete pumping units is desirable, No. 3048 is made up of two single units of pump and motor mounted on a large main pit cover. This main pit cover is made of "Safety Tread" plate steel with 11x15 in. manhole, and separate float, float switch and control for each pump unit are mounted on the pit cover. Either unit is readily removable and floats can be set so that second pump operates when conditions are abnormal.

No. 3029 Sump Pump

A small outfit with capacity from 10 to 23 gal. against heads from 24 to 11 ft. and pit depth of 2 and 5 ft.

No. 1776 New "Minute Man" Cellar Drainer

This outfit will handle 25 gal. per minute against 15 ft. head and will operate satisfactorily against heads up to 23 ft. A concrete or brick pit is recommended but a sewer tile may be used as a sump.

Features— Attractively finished in bronze and black; can be used for pits from 1½ to 5 ft. deep; pump is self-priming centrifugal with bronze impeller and stainless steel shaft; galvanized foot valve and strainer prevent foreign matter entering the pump.

Complete outfit includes ¼ hp. motor of standard make, 8 ft. lamp cord with plug, sentinel circuit breaker for motor protection, foot valve, 3-ft. suction pipe and float switch.

**"Minute Man" Cellar Drainer,
No. 1776**

GOULDS AUTOWATER SYSTEMS PROVIDE RUNNING WATER ANYWHERE

These systems are made in two general types and in several sizes in each type to meet every condition and every home from the small cottage to the large country estate, from roadside lunch stands to hotels, camps, schools, country clubs, industrial plants, mills, warehouses, etc.

They are built with electric motor for use where

electricity is available and with gasoline engine for use where it is not.

Sources of water supply may be divided generally into (1) shallow wells, springs, streams, lakes, etc., where the total suction lift does not exceed 22 ft. and (2) deep wells where the suction lift exceeds 22 ft. and may be as deep as 640 ft.

"Ever-Oiled" Shallow Well Water Supply Outfits

These outfits pump water into pneumatic pressure tanks whence it is delivered to the fixtures at a maximum pressure of 43 lb. They may also be used with open or gravity tanks whence the water is delivered to the fixtures by gravity.

Fresh Drinking Water—All Goulds shallow well outfits can be installed so that fresh water for drinking purposes can be pumped direct from the well without entering the tank, while water for household purposes is taken from the tank.

Automatic Operation—All Goulds electric driven outfits will start and stop automatically without any attention. Those for pressure tank service have an automatic pressure regulation, while those for open tank service require an automatic float switch, both of which give automatic operation. Engine driven outfits stop automatically but must be started each time.

"Ever-Oiled" Water System W-40

The "Ever-Oiled" System W-40 meets the modern demand for completely assembled, attention-free, fresh water supply equipment. Has capacity of 210 gal. per hour, suction lift of 22 ft., and discharge pressure of 43 lb. Automatic and quiet in operation. It can be installed and forgotten, with assurance of steady uninterrupted service.

The complete system includes a full-powered $\frac{1}{4}$ hp. 60 cycle, repulsion induction motor, built for frequent stopping and starting and for long runs, V-belt, pressure switch, relief valve, and pressed steel base.

Shipped from factory fully lubricated and ready for installation. Installed merely by connecting suction and discharge pipes and wiring pressure switch to house service.

Guaranteed—The pump is unconditionally guaranteed for two years. It will be replaced if operating trouble develops within that period.

Larger "Ever-Oiled" Systems—

Complete water systems with tanks, and in larger sizes than our water system W-40 can be furnished.

"Ever-Oiled" System W-40 for Shallow Well Water Supply

"Automatic Oiling" Deep Well Water Supply Outfits

As the name implies, these outfits are for use in wells where the suction lift of the water exceeds 22 ft.

They can be furnished separately with tight and loose pulleys or single tight pulleys; in pumping units or complete systems with V-belt, enclosed flat belt or silent chain electric motor drives; and in pumping units with engine drive—for wells up to 660 ft. in depth, and for capacities up to 1836 gals. per hour.

The Figure 1782 "Automatic Oiling" Pump is a distinct advance in deep well power head construction. In place of the old small double gears is a large single reduction gear which makes overloading impossible.

An improved method of lubrication assures a continuous flood of oil to every bearing in the working head. A tight-fitting cover completely encloses all working parts and fully protects them from water and dirt.

The well head is securely held on top of an extension of the working head base. It cannot break loose and there is no danger of pipe dropping from its support down into the well.

The air pump is now connected to an extension of the walking beam and operates in perfect alignment with the plunger.

These and other superior construction features of Goulds Deep Well Water Supply Outfits are described in our new Deep Well Bulletin. Copies mailed on request.

Fig. 1782. Deep Well Power Unit

DATA BOOKS

GOULDS PUMPS, INCORPORATED also issue two complete reference books on pumps and pumping.

Copies of each of the books gladly sent on request.

Bulletin No. 400 "Pump-Fax"—A handy data book covering pumping in general. Description of the various types of pumps, their uses, etc., are included

together with a large number of tables of useful data.

Bulletin No. 401 "The Centrifugal Pump"—Goes to considerable detail on the theory, design and operation of centrifugal pumps—an invaluable book for any one interested in the fundamentals of centrifugal pump practice.

Vacuum Pump for Return Line Steam Heating Service

Removes the condensate and air from the returns of a heating system, increasing steam circulation and efficiency. The unit consists of a vacuum creating rotor and a centrifugal impeller mounted on one shaft which is direct connected to an electric motor or steam turbine (can be furnished for belt drive). The shaft is carried on outside annular ball bearings. The rotor and impeller are enclosed in a case above which is a separating tank. When operating, both case and separating tank are under atmospheric pressure. The

Skidmore Automatic Vacuum Pump

The vacuum producing rotor handles the air, vapor and condensate and discharges them to the separating chamber where the air is released to the atmosphere through a float operated vent valve and the water is discharged to the boiler by the centrifugal impeller.

- (1) Unit is bronze fitted throughout.
- (2) Furnished for continuous or full automatic service as single or duplex units.

VACUUM PUMP TABLE OF CAPACITIES

No. of pump	Capacity sq. ft. radiation	G.p.m.	Hp., 10 lb. unit	Hp., 20 lb. unit	Approx. floor space, in.	Approx. shipping weight, lb.
0	5000	8	¾	1	18x34	500
1	8000	11	1	1½	18x46	600
2	16000	22	1½	2	18x48	700
3	26000	35	2	3	18x50	775
4	40000	60	3	5	18x52	800
5	65000	90	5	7½	20x60	1350
6	100000	150	7½	10	20x66	1650
7	150000	200	10	15	20x68	1725

Pumps for 30 to 60 lb. pressure furnished for same capacities.

Condensation Pump and Receiver

The condensation pump and receiver pumps the condensate from the returns back to the boiler after accumulating it in the receiving tank. The Skidmore unit is so designed as to give lowest possible drainage without placing the unit in a pit beneath the floor level. For this reason the motor and shaft are placed vertically at the end of a heavy cast iron receiving tank. This arrangement allows the feed connection to the centrifugal impeller to be at a point only an inch or so above the ground.

The pump is automatically operated by a float switch

Skidmore Condensation Pump

located on the top of the receiver. This places all the electrical equipment (motor and float switch) high above the floor and out of the way of possible flood waters. The unit is made of heavy cast iron and is fitted throughout with a special hard bronze. This pump and receiver is one of the quietest pieces of pumping equipment made and is very easy to install. Inspection and cleaning of the unit may be accomplished by removing six cap screws and without disturbing the return or discharge pipings.

TABLE OF CONDENSATION PUMP CAPACITIES

Size	Capacity sq. ft. radiation	Hp., 10 lb. unit	Hp., 20 lb. unit	Gallons between float	G.p.m. pumped	Inlet, in.	Discharge, in.	Height of inlet, in.	Shipping weight, lb.

THE F. E. MYERS & BRO. COMPANY

Manufacturers of Pumps

ASHLAND, OHIO

Products

DEEP WELL POWER PUMPS; SHALLOW WELL POWER PUMPS.

For Myers Private Water Supply Systems, see Manufacturers' Index.

Myers Self-Oiling Deep Well Power Pumps

Myers Self-Oiling Deep Well Power Pumps are designed for general service. The range of sizes in which they are built adapts them to all kinds of installations. The smaller sizes are ideal for homes, farms, country estates, cottages and similar places. Larger sizes are adapted for creameries, dairies, summer resorts, parks, golf courses, hotels, laundries, centralized schools and colleges, hospitals, public and private buildings and institutions, ice plants, mills, mines, factories, railroads, contractors, etc.

They are lifting water from wells or other sources of greater depth than 22 ft. and delivering it to ground level, forcing it into open or pressure tanks, or elevating it to overhead tanks for reservoirs. Made in sizes 6, 9, 12, 18 and 24-in. strokes.

All working parts are fully enclosed and run in oil. Main frame forms oil

TRADE-MARK

For pressure tank service

reservoir from which the gears distribute oil to all moving parts. Bearing shafts are high grade machinery steel. Gears are double, machine cut from solid cast iron. Pinions are steel. All parts are easily removed for adjustments or replacements.

Regularly fitted with tight and loose pulleys for engine drive or single pulley and belt tightener for motor drive. Are supplied with air cylinder for pressure tank service at small additional cost. Anti-freezing set length for all styles furnished extra when desired.

Myers Self-Oiling Deep Well Power Pumps Complete with Motor or Engine for Belt or Chain Drive

Complete units, except lower cylinder and down or suction pipe, ready to connect to power and water lines. Sizes 6, 9 and 12-in. stroke for belt or chain drive, with high class motor of standard make

mounted on head; belt or chain drive; with or without air cylinder; all moving parts fully enclosed; positive self-lubrication; machine cut gears; back geared 7 to 1 for open or tubular wells. Compact, easily and quickly installed, economical and dependable.

Myers Brass and Brass Lined Working Barrels

Designed for use with Myers Power Pumps and working heads for pumping water from deep wells. They are furnished with brass poppet, bronze spool or bronze ball valves. Shell is heavy wrought steel, lined with special heavy seamless drawn brass tube, swaged out at upper end and tapered to form seat for check valve. Made in different styles and all standard sizes, meeting depth capacity and operation requirements.

Fig. 2450
Brass-lined Working
Barrels

Fig. 2460

Fig. 2629. Myers V-Belt Driven Self-Oiling Deep Well Power Pump Complete with Motor

Myers Self-Oiling Shallow Well Pumps

These pumps are of the horizontal double acting self-oiling type. They are designed for lifting water from wells, cisterns, etc., 22 ft. or less in depth and forcing it to an elevation. Suitable for general service, such as pumping hot or cold water, oil, gasoline and similar liquids. They are also excellent boiler feed or booster pumps.

Construction—Bulldozer Pumps are extremely simple in construction, easily installed and economically operated by either hand power, motor or engine drive. The power end consists of a one-piece casting forming the base of the pump and oil reservoir and enclosing all working parts. The brass-lined cylinder is a one-piece casting attached to the power end by heavy bolts. The large valves, liberal and direct waterways and positive self-oiling system insure safe and economical operation against heavy pressures or at high speeds, securing large volume with largely increased efficiency. All sizes are equipped with air valve for pneumatic water systems, where desired.

Sizes and Capacities—Bulldozer Pumps are made in twelve sizes from 2½x3 in. to 8x8 in., having capacities from 500 to 9000 gal. per hour.

Types—They are furnished in two general types: standard type, for pressures up to 100 lb. or 230-ft. elevation; high duty type, for pressures up to 250 lb. or 580-ft. elevation.

Return Line Vacuum Steam Heating Pump

Removes air and condensation from the return line of vacuum steam heating systems, discharges the air to the atmosphere, and returns the water to the boiler.

The pump consists of two independent units combined in a single casing—an air unit and a water unit. Impellers of both units are mounted on the same shaft, supported on annular ball bearings outside the casing.

The pump is bronze fitted throughout.

The air unit exhausts air and vapors and delivers these to the atmosphere without back pressure. The water unit removes the condensation and pumps it directly into the boiler. By handling the air independently of the water, power is saved.

Supplied either direct connected to standard electric

motors, for belt drive, or for steam turbine drive. For continuous operation, or with automatic control. For boiler pressures not exceeding 40 lb.

Furnished in standard sizes with capacities ranging from 4 to 400 g.p.m. of water and 3 to 171 cu. ft. per minute of air. For serving up to 300,000 sq. ft. of equivalent direct radiation.

Condensation Pump

Removes the condensation from radiators in return line steam heating systems, particularly radiators set below the boiler waterline level, and pumps the condensation back to the boiler.

By making the pump casing a part of the returns tank, and bolting the motor base to the tank, floor space is conserved. The rectangular construction permits installation in a corner against the wall.

Supplied in standard sizes with capacities ranging from 4 to 200 g.p.m. of water. For

serving up to 150,000 sq. ft. of equivalent direct radiation.

Double Suction Centrifugal Pump

For (a) circulating hot and cold water; (b) boosting city water pressure to supply top stories in tall buildings; (c) circulating water to and from swimming pools, through filtering and purifying apparatus, etc.; (d) handling water in air washing and conditioning; (e) for hydraulic elevators, etc.; (f) promoting circulation in pressure hot water heating systems; (g) pumping feed water from the hot well, water softener, etc., to the boiler; (h) removing condensate from heating systems, blow-down from soot blowers and superheaters, exhaust drips from steam ejector air pumps and other auxiliaries, etc.

Easily installed—inlets and outlets can be assembled in a number of positions. The number of elbows and fittings and the labor required for installation are reduced to a minimum. Compact—motor armature and pump impeller are mounted on the same shaft. Simplified—no bearings in pump casing, only one stuffing box. Accessible—pump impeller can be removed without breaking pipe connections, touching packing, or disturbing shaft alignment.

Sizes 2, 3, 4 and 6 in. Capacities to 550 g.p.m., heads to 320 ft. Bronze fitted standard construction; also all-bronze or all-iron for special service.

Centrifugal Pump Operating with Suction Lift

When the Jennings Suction Centrifugal is started, the built-in Nash Hytor Vacuum Pump exhausts the air from the casing and suction piping. Water is quickly drawn into the pump. Full rated capacity is delivered without delay.

Successful performance is assured under conditions where water level is likely to fall, or where air or gas is handled together with the water being pumped. Intermittent operation is possible without a foot valve.

Jennings Double Suction Centrifugal Pump

Jennings Return Line Vacuum Steam Heating Pump

Jennings Condensation Pump

Jennings Suction (Self-priming) Centrifugal Pump

Furnished in 2, 3, 4 and 6-in. sizes for capacities up to 1200 g.p.m. Heads up to 120 ft.

Supplied either bronze fitted or all-bronze construction.

Compressors and Vacuum Pumps for Air and Gases

Operation is as follows: The rotor, consisting of a cylindrical hub, around the periphery of which are chambers or spaces formed by heavy shrouds cast integrally, revolves freely in an elliptical casing or housing filled with water.

As the rotor turns, it carries the water around with it. The water, under the influence of centrifugal force, is compelled to follow the contour of the casing, and alternately to enter and to leave the rotor chambers, twice in each revolution.

Nash Hytor Compressor or Vacuum Pump

Showing the unique principle of hydro-turbine operation

As the water recedes from the rotor, air is drawn into the chambers through the inlet port. As the water is subsequently forced back into the rotor by the converging casing, the air is compressed and then discharged from the rotor through the outlet port.

A separator, supplied with each compressor, frees the delivered compressed air of entrained moisture.

Supplied in several standard sizes for handling up to 5000 cu. ft. of free air per minute. For discharge pressures up to 20 lb.; vacuums up to 20 in. of mercury.

Cast iron standard construction. Bronze fitted, solid bronze and other alloys furnished special.

Sewage Ejector

For pumping unscreened sewage or drainage from basements below the street sewer level, handling crude sewage from low level districts, pumping effluent, sludge and other heavy liquids.

The Jennings Sewage Ejector is of the pneumatic type. Air, compressed to the necessary working pressure by a Nash Hytor Air Compressor, is used as the motive power to pump the accumulated sewage from a pot to the sewer. Air is compressed only to the pressure at which it is used. There are no air storage tanks, reciprocating air compressors or screens. Air valves and reducing valves are avoided.

Operation is as follows: Sewage, under the action of gravity, flows through the inlet check valve into the pot. As it accumulates, it raises a ball float which, when the pot is full, actuates a float switch, thereby starting up the Nash Hytor Air Compressor.

Jennings Pneumatic Sewage Ejector

Ejector Filling

Compressed air is delivered into the top of the pot, closing the inlet check valve and expelling the sewage through the outlet check valve. When the pot has been emptied, the float, having reached the lower limit of its travel, opens float switch stopping compressor, through which, then, the air in the pot is vented. Sewage again flows by gravity into the pot, repeating the cycle.

Furnished in several standard sizes for handling crude sewage, drainage, or similar heavy liquids, up to 1500 gal. per minute against heads up to 50 ft.

Ejector Discharging

Suction (Self-priming) Sump Pump

The Jennings Suction Sump Pump is an open impeller self-priming centrifugal pump for handling seepage water and liquids reasonably free from solids. It is mounted entirely above and either near to or removed from the sump. Only the suction pipe is submerged. It is quickly and conveniently accessible.

There are only two moving parts, the centrifugal impeller and the vacuum priming pump rotor. Both rotate without metal-to-metal contact in the casing. Both are mounted on the same shaft that carries the rotor of the driving electric motor, making possible a single compact assembly.

Capacities up to 250 g.p.m. Heads up to 60 ft.

Jennings (Self-priming) Suction Sump Pump

Suction (Self-priming) Sewage Pump

The Jennings Suction Sewage Pump is similar in design and operation to the Jennings Suction Sump Pump. The principal difference lies in the centrifugal impeller which is of the two-bladed, non-clog, enclosed type. Solids passing through the eye of the impeller will pass through entire wheel. Sand, dirt, sticks and rags are readily handled without damage to the pump and without clogging.

Furnished in 2, 4 and 6-in. sizes. Capacities up to 450 g.p.m.; heads up to 75 ft.

PENBERTHY INJECTOR CO.

Automatic Electric Sump Pumps and Automatic Cellar Drainers—
All-brass Construction

DETROIT, MICH.

CANADIAN PLANT: WINDSOR, ONTARIO

Penberthy Automatic Electric Sump Pumps

Used Wherever Water Accumulates

In spite of our efficient municipal sewerage systems, there are numerous places where water accumulates by seepage, overflow, flood or backing up, that can not be drained off directly, either because the flow line of the sewer is not deep enough or because obstacles intervene between the sump and the sewer.

Among the more common instances may be mentioned the cellars of residences where no sewers exist or where the sewer line is above the basement floor level or deep cellars of buildings, boiler rooms, settling basins, fly-wheel and elevator sumps, tunnels, and scale pits.

While ordinarily this seepage may amount to only a small trickle, its flow is continuous and if neglected the accumulated water soon becomes a real menace to health and property.

To keep such places dry, the incoming water is most economically disposed of as it accumulates, either by an automatic cellar drainer (water or steam operated) or an automatic sump pump (electrically operated). Local conditions determine which is preferable.

Penberthy manufactures a complete line of both types, and can consequently supply the unit best suited to meet requirements.

Conditions favoring the electric pump are:

- (1) For districts where city water pressure is not available, or at least very low.
- (2) Larger quantities of seepage water to be handled.
- (3) Discharge heads up to 20 ft.
- (4) Low cost of operation.

Installation

The automatic electric sump pump is set in a floor sump which can be conveniently made by taking a piece of 15 to 24-in. sewer crock 2 ft. long. A sump cover is recommended. The pump outlet is piped to the nearest and lowest sewer or surface outlet. The motor switch cord is plugged into the nearest plug or light socket and the pump is ready for operation. Be sure that the electric current is left permanently connected to the motor switch, and that the electric current is entirely suitable to the motor furnished with the pump. General instructions accompany each pump. There are no projecting arms or delicate parts to require special supports or projection. The entire unit is simple and easily installed and operated. It meets all the requirements of the various building codes.

Penberthy Automatic Electric Sump Pump

Installation Details

DIMENSIONS OF SUMP PUMPS

Size No.	A Height of pump, ft. in.	B Depth of sump, ft. in.	C Base to motor, ft. in.	D Diameter of base, in.	E Cent. cut-outs in cover, in.	F Discharge pipe, in.

5G	9 10	8 6	8 7	11 3/4	6	1 1/4

Specifications

Motor—Repulsion induction, 110 volts a-c. 60-cycle; ball thrust bearings. No. 1G—1/8 hp.; No. 2G, 3G, 4G and 5G—1/4 hp.

Motors to suit other current characteristics at a slight additional cost.

Switch—Reliable and durable. Mercury tube switch specially adapted for float operation. Well insulated. No sparking. No mechanical contacts to wear. Controlled by large heavy copper float.

Adjustable bronze ring governs starting water level.

Fully Enclosed Tobin Bronze Impeller Shaft—Held to perfect alignment and supported by ball bearings—motor shaft relieved of all undue strain.

Pump—Bronze throughout, centrifugal type, high capacity and efficiency, see table of capacities below.

Material—Copper and bronze throughout.

Sump—Preferably sewer crock 15 in. in diameter or larger—larger sizes preferable. Prevent undercutting, settling and exclude dirt by cementing bottom of crock, this also provides a foundation for pump.

Sump Cover

A sump cover is recommended to exclude ashes, coal dust and other solid material from accumulating in sump. Penberthy Sump Pump Covers provide proper working clearances for the automatic control mechanism.

Automatic Cellar
Drainer
Sizes 3, 4 and 5

Penberthy Automatic Cellar Drainers—Water Operated

The Penberthy Automatic Cellar Drainer has been on the market for years and is of distinct service for installations such as office buildings, residence or factory basements, sumps, tanks, settling basins, flywheel, elevator, coal and scale pits, or wherever it is desired to remove seepage, flood or backwater from point below the natural drainage level of sewer.

For conditions such as these the Penberthy Automatic Cellar

Drainer offers a desirable solution, as it operates by city water pressure and the drainer itself is ideally constructed to occupy the least possible space. It is also entirely automatic and requires no attention after installation.

Special Notice: The capacities given are the actual capacities of water taken from sump and not the combined discharge of operating and drainage water as given in most tables. For higher elevations than shown above, special drainers can be made.

QUIMBY PUMP CO., INC.

MAIN OFFICE AND WORKS
343 Thomas Street, NEWARK, N. J.

BRANCH OFFICES AND SALES REPRESENTATIVES IN PRINCIPAL CITIES

QUIMBY HOUSE AND SPRINKLER PUMPS

Quimby Screw Pumps

House Pumps—There are hundreds of Quimby Screw Pumps on house service in New York City alone. For many years the unique features of this pump have appealed to architects and engineers, who have specified it because of its simplicity, durability, quiet operation and efficiency under conditions where a centrifugal pump is unsuitable. Our sales engineers are showing new people every day how to reduce their operating cost by the use of Quimby Screw Pumps for house or booster service.

Quimby Standard Screw Pump

The construction of the Quimby Screw Pump is extremely simple. There are no valves and no air chamber, for the discharge is pulseless and will not cause noise in the piping.

Cross Section

Longitudinal View

Construction of Quimby Screw Pump

The water enters through a suction chamber below the pump directly from the street mains or from a surge tank, and passes to the two ends of the cylinder where it is trapped by the screws and forced to the center discharge chamber. Shaft stuffing boxes are on the suction side so that there is no danger of blowing out packing. Foundation bolts are not required because there is no vibration.

The Only Two Moving Parts in a Quimby Screw Pump

The Quimby Screw Pump is built in sizes suitable for all house pump applications for pressures up to 200 lb. per sq. in.

Sprinkler Pumps—For sprinkler service the Quimby Screw Pump has long been recognized as particularly suitable. Centrifugal pumps are apt to overload on this service due to the two conditions required, but the screw pump serves both purposes without overload and with reduced power consumption. Quimby Screw Pumps are built for pressures up to 300 lb. per sq. in. for this service.

Quimby Centrifugal Pumps

Quimby Single Stage Centrifugal Pumps—These pumps are suitable for house service in moderate sized buildings. Running at 1700 r.p.m., they are built for capacities up to 800 g.p.m. and heads up to 170 ft. At 3400 r.p.m. they are built for capacities up to 1600 g.p.m. and heads of 680 ft.

These pumps are built in accordance with a new design and give unusually high efficiencies. They are all of the horizontal split case type, with double suction impellers, ball bearings, and are fully bronze fitted. They operate without noise at high speeds and are particularly desirable for house pump service.

Quimby Single Stage Type Pump

Quimby Multistage Centrifugal Pumps—Made in three sizes for capacities up to 500 g.p.m. at heads up to 1400 ft. at 1750 r.p.m.

These pumps embody all the latest improvements in centrifugal pump design and have many unique features. Impellers are of the side suction balanced type, of enclosed construction. These pumps are bronze fitted throughout and designed to give maximum efficiency and long life. A perfect balance is maintained at all times by the use of an automatic hydraulic balancing disc.

Quimby Two-stage House Pump

All types of Quimby House Pumps are designed to give satisfactory service without the use of aids, such as mats and rubber hose connections used to deaden noise or absorb vibration.

Our sales engineers are always at the service of architects and engineers and will welcome the chance to study any pumping problems.

Eight-stage Pump with Top Half of Casing Raised

QUIMBY CIRCULATING PUMPS

Type E—Open Impeller

The Quimby Vertically Split Case Open Impeller Type E Pumps were especially designed to meet many building needs. They are suitable for service as circulating pumps for hot or cold water, and for calcium or salt brine in either open or balanced systems. Their construction also renders them suitable for swimming pool circulation and cleaning pumps.

Quimby Vertically Split Case,
Type E Centrifugal Pump

They are mechanically balanced for either a suction lift or a suction pressure, and are capable of operating with a suction lift up to 15 ft. when primed and a foot valve is used. Built in four sizes—Nos. 1, 1¼, 1½ and 2 for direct connection to motors. Capacities up to 500 g.p.m. at heads up to 150 ft.

Construction—For clear water these pumps are bronze fitted; for calcium brine, all-iron to avoid electrolysis; and for salt brine, all-bronze. Impellers are open type, balanced suction, mechanically and dynamically balanced, rigidly keyed to shaft and may be removed easily without disturbing piping connections. The close-grained cast iron, accurately machined, and vertically split casings will withstand a pressure of 200 lb. per sq. in.

The shaft is keyed for impeller and coupling; stuffing boxes are liberal in depth and water sealed for suction lifts; bed plate is cast iron, box type, ribbed, stiffened and machined.

No. 1 pump has 2-in. suction and 2-in. discharge.

No. 1¼ pump has 2½-in. suction and 2½-in. discharge.

No. 1½ pump has 3-in. suction and 3-in. discharge.

No. 2 pump has 4-in. suction and 4-in. discharge.

Type RS—For Large Capacities

The Quimby Type RS Balanced Centrifugal Pump is suitable for large capacities. For service as swimming pool filling pumps and other applications where large capacity pumps are required, their advantages are many.

Designed especially for applications where dependability under continuous operation is essential. An almost perfect balance for the rotating elements is obtained by the use of a special dynamic balancing machine. Efficient and quiet in operation.

Built in sizes having capacities from 35 to 16,000 g.p.m. at heads from 15 to 250 ft. Suitable for direct connection to motors and steam turbines.

Construction—Fittings of bronze or iron as required. Impellers are statically and dynamically balanced; inside, hand finished; outside, machine finished.

Impeller wearing rings are furnished around both impeller entrances to hydraulically balance any axial thrust.

Type RS Centrifugal Pump

Bronze sleeves on the shaft extend through stuffing boxes to protect the shaft from liquid being pumped. Stuffing boxes are deep and water sealed. Gland is split and held by swing bolts, making packing easily accessible. Bed plate has planed pads for pump and motor. Bearings are equipped with ring oilers in large oil reservoir. Flexible couplings allow for slight variations in alignment.

QUIMBY HIGH PRESSURE PUMPS FOR WASHING SERVICE

Architects and engineers writing specifications for garages will be interested in the Quimby High Pressure Screw Pumps for washing service.

Quimby Standard Screw Pumps are used for this service, mounted on bed plates complete with motors of the proper current characteristics for the job. Since they take the water direct from the supply tanks or the city mains, they can be placed in any location which best meets the needs of the user.

The most important requirement of a pump for this service is that it delivers a stream of water under pressure without pulsation. The Quimby Screw Pump meets this requirement and eliminates the excessive high pressures hitherto used. The cleansing action of water is most effective and rapid at 10 g.p.m. per nozzle at a pressure of 200 lb. per sq. in.

Complete units can be furnished with valves, hose and as many nozzles as are required. The nozzle furnished is a patented one designed to give the best service with this type of pump. It is of rugged construction and cannot be harmed by dropping it on floors. It is equipped with a hardened steel chisel for scraping mud from under fenders.

Pressure Stream from Quimby Pump

QUIMBY CONDENSATION RETURN UNITS

In many buildings it is necessary to set some of the radiation so low that the hot water of condensation will not return to the boiler by gravity. The Quimby Condensation Return Unit is designed to collect the hot water in such cases and pump it back into the boiler. The saving of fuel is greatest when the water is returned to the boiler hottest. The Quimby Unit takes advantage of this saving and does not allow water to remain in the receiver long enough to get cold.

Condensation Return Unit with Horizontal Tank

There are many types of Quimby Condensation Return Units, which can be made to suit every need and space requirement. They are furnished for any capacity depending on the area of radiation, and for any boiler pressure.

In all Quimby Units a common bed plate is used to carry all the equipment. Pumps, tank, valves and float switches are all assembled ready for piping and wiring.

The pumps used in Quimby Units were designed especially for hot water service and have years of experience behind them.

Condensation Return Unit with Horizontal Tank and Pumps on Different Sides

In every type of unit—whether low or high pressure, small or large capacity, vertical or horizontal tank, single or duplex pumps—the advantages of the Quimby Condensation Return Unit are always found. Water is not allowed to lose its heat, flexibility of design, and unified mounting of all equipment on a common bed plate.

High Pressure Unit with Vertical Tank

QUIMBY ELECTRIC SUBMERGED VERTICAL SUMP AND BILGE PUMPS

Quimby Sump Pumps are always ready for service, automatic, accessible in all parts and capable of handling dirty water containing more or less solids. A centrifugal pump has to be primed. By having the starting device set so that the pump will not start until it is submerged, the certainty of priming is automatically assured and the necessity of a foot valve eliminated.

These sump pumps are designed to run at either 1150 or 1750 r.p.m. without noise or vibration. Complete fully automatic units can be furnished when desired with tank, cover, float switches, starters, and high water alarm.

Quimby Sump Pumps are built for capacities up to 1000 g.p.m. at heads up to 150 ft.

Construction—The self-aligning roller bearing which carries the impeller and vertical shaft is situated at the level of the sump pit cover instead of being at the pump and thus underneath the gritty water. The pump is suspended from the cover plate by a steel tube through which the vertical shaft passes. The discharge pipe also passes through the cover plate. The plate is removable with its attachments which permits free access to all parts. For pumps more than 6 ft. long, one or more bearings are used to steady the shaft.

Motor is of the vertical type, direct connected to the pump by a flexible, noiseless coupling.

Heavy angle iron safety curbs for square or rectangular pits, and cast iron curbs for circular pits carry the cover plates and can be furnished gastight to specification.

Pump Nos. 1, 1¼, 1½, 2, 3 and 4 have respective discharge sizes of 2, 2½, 2½, 3, 4 and 6 in.

Quimby Sump Pump

QUIMBY SEWAGE EJECTORS

Quimby Electric Single and Duplex Dry Pit Sewage Ejectors

Capacities from 30 to 1000 gal. of sewage per minute.

Advantages of the Quimby Ejector are simplicity in construction, few moving parts and economy of operation. All moving parts, except the automatic control, are outside the sewage chamber and easily accessible. Vertical pump shaft is covered to prevent accidents if it is necessary to enter pump chamber while the pump is running.

Quimby Duplex Sewage Ejector

Sewage Receiver—Is a gastight steel tank with a manhole, gastight cover and steel bar screen.

Ejector Pump—Is substantially the same as the sump pump, but fitted with non-clogging impeller.

Emergency Pump Connection—Supplied to drain pit in case it becomes flooded.

Duplex Ejectors—Have great advantages over single type. In case repairs are needed on one pump, motor, or automatic control, the other handles the sewage without interruption.

Each pump is usually large enough to handle the ordinary amount, but in case of an unusual flow both pumps operate until the receiver is empty.

Non-clogging Impeller

Used in small size Quimby Sewage Pumps

Horizontal Ejectors

Horizontal ejectors are used when all the fixtures from which the tank fills are above the floor level. This type of ejector obviates the necessity for a pit. In construction it is very similar to the Dry Pit type. The pumps can be attached to the tank in any way that best meets space requirements.

Horizontal Ejector

Quimby Pneumatic Sewage Ejectors

Where the conditions of service are too heavy for the centrifugal type of electric sewage ejector, Quimby Pneumatic Sewage Ejector is used. This is built in a wide range of sizes

Quimby Duplex Pneumatic Sewage Ejector

and for almost any discharge head. Its operation is controlled by a patented valve. This installation has proved satisfactory under all conditions where other types of ejectors are unable to perform the work.

Submerged Ejectors

Submerged ejectors are used when there is no place for the large pit required by the Dry Pit type. The pumps are of the same construction, except for the fact that they take their suction from the bottom, as in a sump pump, instead of from the side. Non-clogging impellers are standard equipment.

No screens are required on any Quimby Sewage Ejector.

Single Submerged Ejector

TABER PUMP CO.

295 Elm Street, BUFFALO, N. Y.

Products

TABER STANDARD SUMP PUMPS; TABER STANDARD SEWAGE PUMPS; TABER MIDGET SUMP PUMPS.

Also Taber Booster and Circulating Pumps, Taber Centrifugal and Rotary Pumps, and Specially Engineered pumps.

Standard Sump Pumps

Self-contained single units suspended from substantial sump cover plates. Duplex units suspended from auxiliary elliptical plates mounted on main cover plates. Built for pits 5 ft. deep which allows for 3 in. of clearance at bottom. Pumps can be built for other diameters or for special depths at a nominal extra cost. Pumps are provided with automatic control. Auxiliary automatic starters furnished as additional equipment.

Standard Sewage Pumps

Wide open type impellers pass sewage and toilet tissue. As a protection against clogging, caused by cloths, etc., we urge the use of a strainer basket which we can furnish.

Taber Standard Sewage Pumps are built for pits 5 ft. deep, but can be furnished for other depths. Cover plate is fitted for a 3-in. vent pipe and with a manhole and cover. Entire mechanism, including float can be removed for adjustments without going into pit.

YEOMANS FORM "A" SCREENLESS DUPLEX CENTRIFUGAL ELECTRIC SEWAGE EJECTORS; SHONE PNEUMATIC SCREENLESS SEWAGE EJECTORS; YEOMANS SINGLE and DUPLEX ELECTRIC BILGE or SUMP PUMPS; YEOMANS SUBMERGED TYPE SCREENLESS SEWAGE EJECTORS.

Also Yeomans Horizontal Centrifugal Pumps; Yeomans Condensation Return Pumps; Automatic Lubricators; Rotary Air Compressors and Dry Vacuum Pumps.

Yeomans Form "A" Sewage Ejector (Screenless)

Form "A" Duplex Ejector (Screenless)

The Form "A" Sewage Ejector is a complete pumping unit and represents the last word in quality equipment. It consists of two vertical, non-clogging centrifugal pumps operating in dry pit, connected to cast iron sewage receiver. Pumps driven by vertical motors mounted on receiver cover. Equipped with automatic controllers, high water alarm, pit-drainage connections, gate and flush back check valves. Top plate of pump casing can be raised without disturbing shafting, bearings or impellers.

No accumulation of solids in receiver, requires minimum space, high efficiency, noiseless, sanitary and reliable. Non-clogging impeller does away with screens. Complete details given in Bulletin A-2300.

FORM "A" DUPLEX EJECTOR (SCREENLESS).

Yeomans Heavy Duty Bilge or Sump Pumps

Automatic, self contained, heavily constructed, slow speed machines, with submerged centrifugal pumps, vertical direct connected motors and automatic controllers, equipped with standard open impellers. Unsurpassed for handling waste water, seepage, drainage, flood water, boiler blowoff heating returns. Will handle any hot drainage with absolute certainty. No priming devices required.

Furnished with either moderate or slow speed, continuous or intermittent duty motors and with high water alarms, pipe casing for float, force feed lubricated bearings, automatic oil economizers, etc., as desired. Write for Bulletin B-3400.

Shone Pneumatic Sewage Ejector (Screenless)

Well known as a most reliable pneumatic sewage ejector. Unsurpassed for simplicity, reliability, durability, substantial design, and economy of operation. No screens required; no accumulation of solids; special non-clogging check valves; no airtight floats; bronze pressure operated piston valves located outside of ejector pit; no electric float switches. Piston valves prevent sewage from getting into compressors. Furnished with either motor or steam driven air compressors. Compressors can be located at any desired distance from ejectors. Ejectors can be operated from air supply maintained for general purposes. Especially recommended for municipal work. Write for complete Bulletin P-4400.

Yeomans Heavy Duty Screenless Submerged Type

Sewage Ejector can be furnished in wide range of sizes and capacities. Absolutely reliable, high-grade machine. Has the well-known Yeomans non-clogging impeller which eliminates all screens—gives years of dependable service at low maintenance cost. Ideal for handling sewage and drainage containing rags, solids and other waste. Engineers will find it effective for use in deep basements, subdivisions, subways, disposal works, power stations and industrial plants.

Write for Bulletin B.S.-8000.

WESTCO SINGLE STAGE TURBINE TYPE PUMPS for low and high head duty; WESTCO CONDENSATION PUMPS and RECEIVERS; BOOSTER SYSTEMS; DOMESTIC WATER SYSTEMS; REFRIGERATING PUMPS for brine and water circulation.

Also Westco Deep Well Turbine Pumps.

Westco Pumps (Turbine Type)

The application of the turbine principle to pumping liquids is an exclusive feature of Westco pumps and is broadly covered by patents. It is the one important improvement in pump design since the development of the centrifugal. The Westco possesses distinct advantages in providing high efficiency performance in small capacities, plus the ability of each individual pump to deliver against high heads in single stage and against

Westco
Turbine
Pump
Motor
Driven

widely varying pressures with little change in capacity or efficiency. The power requirements are comparable to the piston or reciprocating type pump in that power consumption decreases with a decrease in discharge head.

Wide Operating Range—On account of its wide operating range, variations in pumping head, due to

fluctuation of city pressure or change in discharge conditions, affect only slightly the capacity or efficiency of the Westco pump. When pump and motor are selected in accordance with maximum head requirements, any decrease in head will have only slight effect on discharge volume and power requirements will decrease.

Only One Moving Part—The impeller is the only moving part of the Westco pump. It is of bronze or such other material as has been proven most suitable for the individual purpose for which the pump is to be used, and is carried on a shaft of monel metal mounted on outboard ball bearings.

Accessibility—The pump casing is split vertically which permits disassembly without disturbing suction or discharge connections.

Perfect Hydraulic Balance—Westco pumps are of the double suction type, providing equal pressure on both sides of the impeller and a free running clearance without the use of complicated balancing devices. There is no metal-to-metal contact in the interior of the pump to cause friction or loss of efficiency.

Other Features—Westco Turbine Pumps are particularly suited for the following pump duties in modern buildings:

Booster pump—The Westco Turbine Pump can be installed directly in the line, insuring a steady, adequate stream without any pulsations. Delivers against heads up to 250 ft. in single stage at 1725 r.p.m.

Circulating pump for drinking water—Casings are built to withstand high static pressures in balanced systems in high buildings.

Brine circulating pump—Wide operating range eliminates the necessity for accurately computing the pump head. Simply select the pump and motor for the maximum head you

Note: For intermediate sizes and for capacities larger than 200 g.p.m., and for pressures in excess of 100 lb., performance data will be furnished on request.

know will not be exceeded, and no matter how much less than this the head may actually be, the pump will deliver only a slightly increased volume and the power required will decrease with the head, thus removing the hazard of motor overload.

Westco's turbine design insures efficient operation in single stage against heads up to 250 ft., thus eliminating complicated and costly multistage installations.

The pump impeller is direct driven from motor through a flexible coupling. Westco performance is accomplished at standard motor speed up to 1725 r.p.m. against high or low heads.

Grease cups that require replenishment of lubricant but once a year are located on the bearing pedestals. In addition to slight adjustment of packing glands, no other attention is required.

In the bronze fitted or all bronze pump, the impeller is machined from a solid cast bronze disc and from cast iron in the iron fitted pump. It is also made from other metals when conditions demand.

Westco Turbine Pumps are sealed against leakage by a round rubber gasket which fits in grooves in casing and cover.

Due to Westco's compact, simple design, only minimum floor space and headroom are required for installation. Silent operation is a distinguishing characteristic of the throbless, humless, smooth-running Westco.

Write for copy of Architect's Specifications.

Westco Domestic Water Systems

Ideal for supplying the water needs of suburban or farm homes, estates, golf courses, greenhouses, etc., and are much used for booster service in apartment dwellings where normal city water supply does not deliver adequate pressure to upper floors. They will deliver all water needed under adequate pressure, even in case of fire.

The pump is of the turbine type, all-bronze construction, self-priming. It is simple in design, having only one moving part; there is no metal-to-metal contact to cause friction or wear. The pump operates silently and requires only minimum attention. The motor is direct connected. Speed, 1725 r.p.m. Because the pump is capable of pumping both air and water, an automatic air volume control is employed which makes the system truly automatic in every respect.

The tank is extra heavy steel, galvanized inside

Westco Domestic Water System

and outside. Automatic mechanical pressure regulator is supplied.

The standard setting provides that the switch will cut in at 20 lb. and cut out when the storage tank pressure reaches 40 lb.

Westco Water Systems are furnished in all sizes and also gasoline engine driven where electric current is not available.

Westco Condensation Pumps and Receivers

For automatically returning to low and high pressure steam plants, condensation from radiation systems, heaters, steam coils, etc.

They save the water supply, and to a considerable extent the fuel, by returning the condensate while hot. Through their aid proper circulation in the system is induced.

These units are entirely automatic in operation and consist of a Westco Bronze Fitted Pump equipped with two outboard ball bearings, and direct connected to an electric motor of approved make.

All pumps are of the double suction type, designed in such a manner that they can be entirely disassembled without disturbing the suction and discharge connections.

Receiver tank is made of heavy steel plate, galvanized inside and out, and is provided with a vent opening to allow the escape of any vapors that come back with the condensate.

The tank has an inlet opening at the top, also end. The suction pipe is connected in the bottom of the tank and extends up in the receiver sufficiently to allow liberal space for collection of sediment which can be cleaned out through drain opening.

Necessary piping and fittings between pump and receiver tank are furnished with all units.

The float control switch is of approved make—enclosed type—meets requirements of the Underwriters. It is mounted on a cast iron plate which is bolted to the head of the receiver and is actuated by means of a seamless copper float inside of tank.

Write for copy of Architect's Specifications.

Products

AIR COMPRESSORS: Air, Hopper and Water Cooled; and Piston Type DRY VACUUM PUMPS for many purposes. Air compressors range from 1 to 128 cu. ft. displacement and from 100 to 200 lb. pressure according to size of compressor and requirements. Vacuum pumps are suitable for displacements of 10 to 40 cu. ft. and for maximum vacuum of approximately 28 in. at sea level.

Quincy Air Compressors and Vacuum Pumps

Compressors and vacuum pumps are supplied individually or in complete built-up units in any desired style with or without pressure or vacuum control and either belt driven by V-belts, direct connected, chain or gear driven.

All belt driven units are equipped with single or multiple V-belts, are of special construction affording flexibility and capacity to absorb starting shocks. Because V-belts are intended to run loose and without slippage there is less bearing strain and consequently less wear on both compressor and motor bearings. V-belts will not jump off pulleys and there are no troublesome idlers. A positive power saving of from 20% to 30% by actual test results from the use of V-belts over the conventional flat type with idler or belt tightener. Quincy Compressors are built along the most advanced engineering lines and with the idea of producing a compressor having long life, low upkeep costs and with comparative freedom from trouble.

Model WD—Multiple V-belt driven, water cooled units, furnished with any required control. Full pressure lubrication.

No.	Displacement, cu. ft.
WD-1	15-22
WD-2	25-39
WD-3	40-75

Model WD

Model WC—Complete automatic water cooled units with tanks, automatic water valves, pressure controls, and motor starters. Full pressure lubrication.

Westinghouse-National Air Compressors

Westinghouse-National Air Compressors are made in a great variety of types and sizes to supply air for every conceivable need in factory or office buildings, such as: operating pneumatic tube systems and elevator doors; cleaning and general utility in engine rooms, etc. These machines are of simple and compact design, reliable in action, efficient, with an enviable record for durability and low maintenance.

Steam Driven Compressors—This line includes single stage and compound machines. The single stage type is made in three standard sizes: 8, 9½, and 11 in., with displacements of 35, 49, and 66 cu. ft., normally for 80 lb. air pressure and 100 lb. steam pressure. Other sizes for special steam and air requirements. Catalogue T-2036.

Single
Stage

Cross
Compound

Cross compound compressors are of larger capacity, have higher efficiency, and are more economical in use of steam. The 8½ in.-120 cu. ft. is for 160 lb. steam and 140 lb. air. The 8½ in.-150 cu. ft. is for 200 lb. steam and 140 lb. air. The 10½ in.-150 cu. ft. is for 100 lb. steam and 80 lb. air. Catalogue T-2037.

Motor Driven Air Compressors—These are compact self-contained units that need no elaborate foundation nor heavy installation cost. Driven direct by motor, or through efficient herringbone gear and pinion, thus eliminating troublesome belts. Motors for any commercial circuit. Distinctive means for unloading during starting cycle. Start and stop method of control assures minimum operating cost. Flat washer type of inlet and discharge valve. Positive, automatic lubrication with but one place for oil refilling. Sizes 2½ to 727 cu. ft. displacement, for pressures up to 350 lb.

"N" Type

"SV" Type

"SV" Type—Direct-connected to motor with flexible coupling and mounted on common base, with air gage, and automatic controller. One or two cylinders, single stage, single acting. Air-cooled for intermittent operation, water-cooled cylinder head for continuous operation. Efficient, quiet running, and compactly arranged without sacrifice of accessibility. Sizes 2½ to 22¾ cu. ft. Maximum pressure 150 lb. Catalogue 830.

"N" Type—Two-cylinder, single stage, single acting, gear driven. Air-cooled for intermittent operation, water-cooled cylinder heads for continuous operation. Has positive and reliable unloader for alternating current motor drive. Sizes 12½ to 100 cu. ft. Pressures from 30 to 150 lb. Complete portable outfits also. Catalogue T-2048.

"2V" Type

"QL" Type

"QL" Type—Two-cylinder compound with double trunk pistons, gear driven, water-cooled for continuous operation, with intercooler built in. Sizes 10 to 35 cu. ft. for 200 or 350 lb. pressures. Catalogue T-2048.

"2V" Type—Two-cylinder, single acting, gear driven. Sizes 75 to 200 cu. ft. and three forms, viz., 2VSA, single stage air-cooled for intermittent operation against 50 lb.; 2VSW, single stage water-cooled for continuous operation against 135 lb.; 2VCA, compound, for continuous operation, air-cooled for pressures up to 135 lb., water-cooled for 150 lb. maximum. Also made for 200 and 350 lb. pressure, 35 to 87 cu. ft. sizes. Portable outfits also. Catalogue T-2047.

"Q3VS" Type

"3VS" Type

"3VS" Type—Three-cylinder, single acting, gear driven, single stage (3VS) or compound (Q3VS) as desired. Water-cooled for continuous operation. Sizes from 210 to 506 cu. ft., pressures from 75 to 350 lb. Compound machines have self-contained intercooler. Distinctive automatic control is integral part of the compressor outfit, provides valuable protective features, insures most economical operation, and simplifies installation, as the outfit is ready for use when connected to the electrical, water, and air mains. Can also be built for portable use. Catalogue T-2032.

"3VD" Type—Three-cylinder, double acting, gear driven, single stage (3VD) or compound (Q3VD) as desired. Water-cooled for continuous operation. Pressure range 100 to 350 lb. Compound machines have self-contained intercooler. Sizes 560 to 727 cu. ft. Equipped with same control as 3VS compressor. Catalogue T-2032.

CRANE CO.

Crane Water Supply Systems

836 South Michigan Avenue, CHICAGO, ILL.

For Branch Offices, see our Plumbing Section

Product

CRANE DEEP and SHALLOW WELL PUMPS and WATER SUPPLY SYSTEMS.

For our pages on Water Heaters, Water Softeners, Plumbing Fixtures and Gas Fired Boilers, see Manufacturers' Index.

Description

There is a Crane shallow well water system to meet every requirement. Capacities from 200 to 6000 gal. per hour. For deep or shallow wells. Electric or gasoline power.

Stoutly Constructed—The *oversized* parts of a Crane-Warlo system mean *underworked* parts with minimum strains and wear.

Quality Materials—Crankshafts forged and specially heat treated have double bearings of highest quality. Every bronze part is forged, not merely cast.

Perfected Design—Design is simple. No delicate or complicated parts to get out of order. Flood lubrication reduces wear. The patented device which prevents the oil from mixing with the water has no packing to wear, leak and need replacing.

Completely Accessible—In no other pump are parts so easy to get at. For example, the valves can be reached by merely removing one nut.

Parts Interchangeable—Bearings are machined to .005 in. So exact is the precision that parts are interchangeable without fitting.

Thoroughly Tested—Every Crane-system is tested for 5 hours under full working load. It must prove its ability to pump its full capacity with standard current consumption before it is allowed to leave the factory.

Styles Nos. 252 and 254A

Style 254A shown here, has a 40-gal. storage tank which obviates the

necessity for frequent starting and stopping. Style 252 is the same as 254A, except the storage tank is replaced by a cushion tank for fresh water service.

Both these systems offer splendid examples of the high quality of Crane engineering. Their capacities are 250 gal. an hour in place of the usual 200 gal. from a depth of 22 feet or less. This extra flow is enough to supply a line of hose under continuous pressure.

Every part of these systems is accessible; no unions, no pipe connections, no wires need be broken to get at both the suction and discharge valves. The motors are of heavy duty, refrigeration type with wool yarn packed bearings that need lubrication but twice a year; the self-oiling system on the pump requires attention but once a year. To reduce friction, operating costs, and increase the life of the pump, anti-friction bearings have been used to carry the crankshaft.

Crane Deep Well Systems

The Crane deep well systems Nos. 850 and 1050 are greatly improved types which have achieved widespread popularity. They are offered in types and capacities to pump from 125 to 1000 gal. of water from depths down to 550 ft. They are single stroke, self-oiled systems, built of the finest materials obtainable, machined to a precision not found in ordinary pumps. They have a positive overhead oiling system, the oil being carried by gravity to every pin and bearing. Every part is constructed for enduring, untroubled operation.

For electric power, either belt and idler or silent chain drive is supplied. The systems can also be supplied equipped for oil with gas engine power.

Among the many sizes and capacities of the Nos. 850 and 1050 is one for any set of conditions.

TRADE-MARK

and stopping automatically. They are self-priming, self-oiling and economical in operation.

Duro tanks are galvanized armco ingot iron—non-corroding and rust resisting. The Duro Automatic Air Regulator prevents air-binding or water logging of the tank. This is a patented special Duro feature incorporated in all Duro Water Systems.

Where Duro Pumps and Systems Are Used

Duro meets every requirement for satisfactory water service. Duro Pumps and Water Systems automatically supply fresh running water under uniform, strong pressure from deep or shallow wells, lakes, streams, springs, cisterns, etc., for homes, farms, ranches, camps, country clubs, greenhouses, dairies, yachts, and scores of other installations.

Duro Pumps and Water Systems are completely automatic, silent and entirely carefree; starting

How to Specify

Simply state both horizontal and vertical distances from source of water supply to point where service fixtures will be installed.

Give approximate usage of water during peak period and the usual weekly consumption.

Consult Duro Advisory Service

Duro maintains an Engineering Advisory Service, operated by 200 factory trained experts. These engineers are at your service at all times to go over proposed jobs on the ground and make recommendations.

There is one near you who will work with you without obligation.

Warranty

Duro Products are warranted in writing for one year from date of purchase against defects in material and workmanship.

THE DEMING COMPANY

Manufacturers of Hand and Power Pumps for All Uses

SALEM, OHIO

GENERAL AGENCIES IN ALL PRINCIPAL CITIES

Products

DEMING HYDRO-PNEUMATIC SYSTEMS, operated by Hand or Windmill, Gasoline Engine, or Electric Motor. Pumping Machinery, for operation by any power,

including SINGLE and DOUBLE ACTING TRIPLEX PUMPS for various services, DEEP WELL POWER WORKING HEADS, ARTESIAN WELL CYLINDERS.

Deming "Marvel" Water Systems Fig. 2085

For vertical suction lift of 25 ft. or less.

Fig. 2085 water systems are practically noiseless in operation and entirely automatic, requiring little attention, and only occasional replenishment of oil in the crankcase.

They are self-priming, self-lubricating, self-starting, self-stopping—self-operating in all respects.

Each "Marvel" Water System includes:

Deming Fig. 1685 "Marvel" Pump, with electric motor, endless V-belt, air valve, vacuum chamber and double-pole automatic electric switch.

Galvanized steel tank, of capacity as listed in table below.

Pressure gauge.

Automatic air control.

Relief valve.

"Marvel" System No. 2085

Check valve.
Fresh water outlet.

Pipe fittings to connect between pump and tank, as illustrated.

Cast iron sub-base or floor plate.

For complete information write for Water System Catalog "L."

When ordering, be sure to specify Fig. 2085, adding the system number as in the table below.

FIG. 2085 SIZES, WEIGHTS, ETC.

Size No.	Cap. of pump, gal. per hr.	Cap. of tank, gal.	*Hp. of motor	Max. working pressure, lb.	Ship. weight of system, lb.
1 - 42	265	42	1-6	50	230
1½ - 42	315	42	¾	50	240
2 - 42	480	42	1-3	50	275
2 - 120	480	120	1-3	50	410
2½ - 120	600	120	½	50	425

*Regularly furnished for 110-220 volt, 60-cycle, single phase, a-c. When current characteristics differ, be sure to so state, when ordering.

Deming "Oil-Rite" Double Acting Piston Pump Fig. 1809

For vertical suction lift of 25 ft. or less.

Fig. 1809—Size 2½ x 3 in.

Fig. 1809 is a single cylinder, double acting power piston pump, which is especially adapted for open or pneumatic tank service.

The enclosed type of crankcase is designed to meet an

increasing demand for a pump which has as few exposed working parts as possible, thereby securing maximum safety of operation as well as flood lubrication.

This pump is made in four sizes with a capacity range of from 9 to 50 gal. per min., meeting a great variety of pumping requirements, where the vertical distance to the lowest water level does not exceed 25 ft. and the total combined suction and discharge head does not exceed 100 lb. See table below.

Any one of the four sizes of Fig. 1809 pumps can be mounted together with motor, tank, fittings, etc., to make a complete water system. For detailed information ask for our Water System Catalog "L."

Fig. 1809, Typical "Oil-Rite" Water System

FIG. 1809 SIZES, WEIGHTS, ETC.

Piston		Gal. per min. at max. speed	Maximum working pressure, lb.	Pipe connections, in.		Weight, lb.

5	5	50.0	100	2½	2½	725

Gear ratio, all sizes 5 to 1.

Deming "Oil-Rite" Deep Well Working Head, Fig. 1062
For Use Where Water Level Is at a Greater Depth Than 25 Ft.

Fig. 1062 with Tight and Loose Pulleys

FIG. 1062 SIZES, WEIGHTS, ETC.

Stroke, in.	Maximum sizes of pipes, in.		Maximum strokes per min.	Size tight and loose pulleys in. "TL" drive	Weight, tight and loose pulleys, lb. "TL" drives
	Suction	Discharge pipe			
6	2½	1½	45	12x2	190
10	4	2½	40	16x3	460
14	5	3	35	20x4	875
18	6	3	30	24x5	1650

Fig. 1062 Pumping Head—Distinctive Features—

Flood lubrication and force feed insures positive, complete and continuous oiling. Helical cut gears, very quiet and efficient. Pinion and crank shaft bearings, extra large and renewable. Crankcase painted on inside with a special white paint that seals all pores. Frostproof set length, places discharge head below frost level. Extra when specified.

No. 1062 Pumping Units—

These deep well pumping units include one Fig. 1062 pumping head together with motor, air compressor and type of drive selected.

The motor may be mounted on top, as illustrated, or mounted at the side of the pump, depending on the condition.

Top motor units, 6 and 10-in. stroke only, may be driven by silent chain or V-belt.

Side motor units may be driven by silent chain or gear on all sizes; also by multiple belt on 14 and 18-in. sizes.

For complete information write for Deming Water System Catalog "L."

Fig. 1062 Pumping Unit with Top Motor Mounting

For the average sized home, an ample water supply is delivered by the Deming Deep Well Water System as illustrated. The arrangement of this system permits the tank of 42 or 120-gal. capacity to be located at any convenient place.

Furnished with either V-belt drive or silent chain drive.

For larger sized systems or different types of drive, write for Deming Water System Catalog "L."

Each system shown in the table below includes:

One 6-in. or one 10-in. Fig. 1062 "Oil-Rite" pumping head, with drive as selected, together with air compressor.

Fig. 1062 "Oil-Rite" Water System

One 42-gal. galvanized tank with 6-in. stroke system.

120-gal. galvanized tank with 10-in. stroke system.

One double-pole automatic pressure switch.

One electric motor of sizes shown in table below.

One brass-lined well cylinder of sizes shown in table below.

One pressure gauge.

One water gauge.

One combination union and check valve.

One gate valve; one relief valve.

Piping and wood rod are not included because their lengths vary in each installation; they should be ordered separately to meet the requirements.

Order by system number as given in table below.

Products

KEWANEE SYSTEMS, which include:
WATER SUPPLY SYSTEMS, Complete Pumping Units, and Pneumatic Tanks.
SEWAGE DISPOSAL SYSTEMS.
Also Electric Lighting Systems.

Services

A competent Engineering Department will co-operate with architects in planning and selecting apparatus for each particular requirement, and layouts will be made and submitted without charge.

Water Supply Systems

Kewanee Automatic Motor Driven Pump

Furnished in capacities to take care of smallest requirements, up to largest country homes and estates, as well as towns. Also especially designed for consolidated schools, isolated institutions, country clubs, etc.

Furnished for shallow or deep well, for motor, gasoline engine, or belt drive from other power.

Complete Automatic Systems—The complete system starts and stops automatically. All parts are oversize. Finest materials that can be procured regardless of their cost, master designer minds

and master engineering skill all combine to make every KEWANEE high pressure plant as nearly perfect as it is possible to build them.

The line of high pressure systems permits the selection of an outfit for most any requirement.

All deep well models have the patented differential cylinder for furnishing air for pneumatic tank service, eliminating the use of an air compressor.

Type 75 Triplex Suction Pump, Silent Chain Drive

Kewanee Centrifugal Units

Maintaining that a single particular pump cannot be applied satisfactorily to an indefinite number of jobs, KEWANEE pumps have been designed in numerous models and sizes, each designed to meet certain conditions and give absolute satisfaction.

The Kewanee line of high-efficiency centrifugals includes open and closed impeller types, single and multistage units, bilge pumps, cellar drainers and deep

well turbines. These machines may be driven by direct connected motor or gasoline engines or by belt from outside power. A line of sewage ejectors is also manufactured.

Kewanee Centrifugal Unit

Pumps for special jobs in any sizes up to and including 72-in. discharge are also made.

KEWANEE engineers will make correct recommendations after analyzing each intended service.

Kewanee Sewage Disposal Systems

KEWANEE SEWAGE SYSTEMS represent a scientific and highly approved simplification of the sewage problem for buildings not served by public sewers. It accomplishes its results bacteriologically without the use of any chemicals. It converts raw sewage into liquid sewage and distributes it over a disposal field where it is changed to pure, clean inorganic matter, harmless to life or vegetation.

The system is recommended for installations having requirements of not over 100 persons on continuous 24-hour basis.

The system is entirely automatic and requires no attention whatsoever.

The system is unaffected by changes in temperature, and is vented through the soil pipe, all odors and gases being discharged through soil pipe stack above the roof.

A few KEWANEE operating specialties and installation instructions, together with necessary construction materials purchasable locally, make it possible for any mechanic properly to install this system.

Brief Description—The KEWANEE SYSTEM consists, primarily, of a septic tank, or anaerobian breeding plant, into which the sewage is first passed and in which it is liquefied, and of a subsurface disposal field through which the liquefied sewage is passed for exposure to air and aerobes, and consequent conversion into clean inorganic gases and pure water.

Summary

The KEWANEE PRIVATE UTILITIES COMPANY provides high grade equipment and dependable service for the average man in the out-of-the-way place.

The equipments go together without mistake, start without coaxing, run without skilled attention, wear the longest time possible, and can be repaired by the unskilled man without experience.

Bulletins

Bulletins covering all KEWANEE SYSTEMS will be sent to any architect on request.

Bulletins especially arranged for the A.I.A. System of Filing will be sent to any architect upon request.

THE F. E. MYERS & BRO. COMPANY

Manufacturers of Private Water Supply Systems

ASHLAND, OHIO

For Myers Power Pumps, see Manufacturers' Index

Myers Electric Driven Pneumatic and Open Tank Water Supply Systems

Fig. 2510. Myers Electric Driven Pneumatic Water Supply Outfit

No. 906AT—Capacity, 250 gal. per hour. Outfit consists of Myers electric house pump with vacuum chamber; relief valve, automatic air volume control valve, air valve, pressure controller, endless belt and $\frac{1}{4}$ hp., 110-volt, 60-cycle, single-phase a-c. motor or 32, 110 or 220-volt d-c. motor, with 42-gal. galvanized tank, base, pressure gauge and fittings, completely assembled ready to install. Suction and discharge are $\frac{3}{4}$ in. Floor space, 25x29 in.; height, 52 in.

No. 909AT—Capacity, 340 gal. per hour. Same as No. 906AT, except it is equipped with $\frac{3}{4}$ hp. motor, and the suction is 1 in., while the discharge is $\frac{3}{4}$ in.

Myers Self-Oiling Deep Well Water System

This Myers water system is designed for wells over 24 ft. in depth.

It is a complete unit, automatically controlled, being composed of a Myers self-oiling deep well working head, $\frac{1}{2}$ hp. motor and other equipment as listed here-with.

This is a large capacity outfit, the volume of water being governed by the depth of the well and the size of the lower cylinder used.

Myers self-oiling double acting electric house pumps are designed for pumping water from shallow wells, cisterns, springs, lakes or other sources not more than 22 ft. in depth and forcing it into pneumatic tanks or into open gravity tanks. Operate on any electric light or power current. An automatic pressure controller is furnished with pneumatic tank outfits; air chambers eliminate water hammer; relief valve protects pump and motor from excessive pressure; power end has long self-oiling, easily renewable bearings. Automatic control eliminates water-logged tanks.

Simple power transmission; few working parts fully enclosed; runs in oil; water end has liberal and direct waterways; large valves. These features result in high efficiency, long life and large pumping capacity at low current cost.

Fig. 2621. Myers Self-Oiling Deep Well Water System

With V-belt or chain drive. No. V2950AMT, complete as illustrated, with $\frac{1}{2}$ hp. 110-220 volt, 60-cycle, single-phase a-c. or 110 or 220-volt d-c. motor, automatic control pressure gauge, V-belt, electric switch and 42-gal. galvanized tank.

No. V2950AMTS, as above, with 4-ft. anti-freezing set length. Lower cylinder and down or suction pipe not included with above outfits

Myers "Direct from Well" Water Supply System

The Myers direct water system will supply an abundance of fresh water direct from the well. No storage tank is used. The opening of a faucet after discharging 1 gal. of water immediately starts the pump. Current is consumed only when water is drawn. The ordinary leakage of a defective faucet will not start the pump, as there is a gallon of water in reserve to take care of minor defects in the plumbing.

Shallow Well Direct Water Supply Outfit—Fig. 2353 direct water system is suitable for shallow wells not more than 22 ft. in depth. It will furnish 500 gal. of water per hour and has sufficient capacity to supply water for lawn sprinkling.

Fig. 2353. Myers Shallow Well Direct Water Supply Outfit

Capacity, 500 gal. per hour. Width, 15 in.; length, 50 in.; height, 25 in. Suction tapped $1\frac{1}{4}$ in.

With V-belt or silent chain drive. No. C92AM outfit consists of Myers No. 912AM self-oiling Bull dozer $2\frac{1}{2}$ x3-in. power pump, wood base, $\frac{1}{2}$ hp. 110-220-volt 60-cycle single-phase a-c. or 32, 110 or 220-volt d-c. motor, silent chain, pressure gauge, electric switch and air chamber for discharge

Deep Well Direct Water Supply Outfit

—Fig. 2626 direct water supply system is suitable for deep well service where depth is greater than 22 ft. Operates in same manner as Fig. 2423 outfit except that it is fitted with a Myers deep well self-oiling power working head. Will furnish 200 gal. of water per hour with 2-in. cylinder, 300 gal. with $2\frac{1}{2}$ -in. cylinder, and 450 gal. with 3-in. cylinder, and has sufficient capacity to supply water for lawn sprinkling at 30 lb. pressure.

Fig. 2626. Myers Deep Well Direct Water Supply Outfit with Silent Chain Drive

Width, 15 in.; length, 32 in.; height, 35 in. Suction tapped $2\frac{1}{2}$ in. and bushed to $1\frac{1}{4}$ in. Discharge, 1 in.

No. V2955AM outfit consists of Myers self-oiling power working head, $\frac{1}{2}$ hp., 110-220-volt, 60-cycle single-phase a-c. or 32, 110 or 220-volt d-c. motor, V-belt, belt tightener, pressure gauge, electric switch, automatic air control, air chamber and wood base

WESTINGHOUSE ELECTRIC & MFG. CO.

EAST PITTSBURGH, PA.

For Branch Offices, see our Lighting Catalogue. For References to Other Products, see Index to Manufacturers

ELECTRIC WATER SYSTEMS (AUTOMATIC)

Two Classes of Systems

Westinghouse Automatic Electric Water Systems pump water from shallow or deep wells, cisterns, streams, springs, or lakes, and deliver that water under pressure to any part of the home or farm. Also, they can be used as booster systems to increase city water pressure to 60 lb.

There are two distinct classes of Westinghouse Water Systems: the shallow-well type and the deep-well type. Shallow-well systems draw water from any source which is not more than 25 ft. (at sea level) below the pump. Deep-well pumps are used in all applications where the lowest water level is more than 25 ft. below the ground level.

Type W-600 Double Acting Duplex Shallow-Well Pump (Belt Drive)

Completely Automatic—Westinghouse Water Systems are made completely automatic by an automatic electric pressure switch and an automatic

air volume control and pressure gauge. The first device stops and starts the pump at the proper times. When the pressure gets down to 20 lb. this automatic switch starts the pump, and shuts it off when the pressure gets up to 40 lb. The automatic air volume control and pressure gauge keep the right proportion of air and water in the tank at all times, preventing the tank from becoming air bound or waterlogged.

Shallow-Well Systems

The type W-225-X, called the fresh flow system, furnishes 225 gal. of water an hour and is an ideal pump for summer cottages, small homes and summer camps, tourist camps, and roadside stands. This type of water system creates a partial vacuum in the line, and atmospheric pressure forces the water to the pump. They may be installed anywhere near the source of supply and are built to deliver 225, 300, 400, 600, 800 and 1000 gal. an hour; equipped with either belt or chain drives. They may be fitted with 42, 80, 120, or 220-gal. tanks or over.

Automatic Electric Pressure Switch

Features—Shallow-Well Systems

Body—A perfectly balanced one-piece rugged casting, eliminating vibration and strains, and insuring constant alignment of all working parts.

Crank Shaft—Heavy drop forging; ground to size; two-bearing type.

Bearings—Bronze bushings; extremely heavy and grooved for proper oiling. Connecting rods and crosshead are bronze; piston rods are tobin bronze.

Automatic Air Volume Control and Pressure Gauge

SHALLOW-WELL SYSTEMS

System No.	Tank size, gal.	Gal. per hr.	Operating range, lb.	Suction, in.	Discharge, in.
W-225-A	42	225	20-40	3/4	3/4
W-225-B	80	225	20-40	3/4	3/4
W-225-C	120	225	20-40	3/4	3/4
W-300-A	42	300	20-40	3/4	3/4
W-300-B	80	300	20-40	3/4	3/4
W-300-C	120	300	20-40	3/4	3/4
W-400-A	42	400	20-40	1	1
W-400-B	80	400	20-40	1	1
W-400-C	120	400	20-40	1	1
W-400-D	220	400	20-40	1	1

Data on 600, 800, and 1000 gal. per hr. furnished on request.

Type W-300 Double Acting Shallow-Well System (Belt Drive)

Packing Gland Assembly—All brass with special long-life packing.

Piston—All brass; removable; complete.

Intake and Discharge Ports—Located high on side of body, making it impossible to lose priming.

Strainer—Brass; built-in.

Relief Valve—All-brass; built-in; positive acting. Prevents excessive pressures.

Switch—Automatic pressure control.

Fresh Water Connection—Located on body of pump.

Belt—V-type. Chain drive, extra.

Valves—Special rubber. Valve location, vertical position, unusually accessible.

Motor—Westinghouse heavy-duty repulsion induction for alternating current. For direct current, compound wound motors.

Deep-Well Systems

This pump differs from a shallow-well pump in that the cylinder and piston are located below the surface of the water instead of being an integral part of the pump. The pump must be installed directly over the source of water supply. The eight types and sizes, with belt or chain drive, take care of the most exacting requirements. These pumps are produced by the latest manufacturing methods, insuring absolute standardization and employing the highest quality of material and workmanship.

Type WDC-41 Deep-well Pump (Chain Driven)

Features—Deep-Well Pumps

Body—Mounted on subbase channel irons for ease of installation and to insure perfect alignment.

Motor—Heavy duty repulsion induction type. Pump speed: WDC-41, 52 strokes per minute; WDB-41, 60 strokes per minute. Air chamber included with pump. Automatic switch. Piston rod, 1/2 in., 12-thread for wood sucker rod. Type WDB-41 has V-Belt; WDC-41 has enclosed silent chain driven working head. Water box, tapped for 3-in. drop pipe. Air pump, all-brass. Check valve, all-brass. Relief valve, built-in, metal to metal seats. Differential cylinder, all brass.

DEEP-WELL SYSTEMS

System No.	Motor hp.	Use 1 1/8-in. cylinder 130 gal. per hr.	Use 2 1/4-in. cylinder 225 gal. per hr.	Use 2 3/4-in. cylinder 325 gal. per hr.
WDC (Chain Drive)				
WDC-41	1/4	50	35
WDC-42	1/2	100	75	50
WDC-43	1/2	175	125	100
WDC-44	3/4	225	175	150
WDB (Belt Drive)				
WDB-41	1/4	50	35
WDB-42	1/2	100	75	50
WDB-43	1/2	175	125	100
WDB-44	3/4	225	175	150

Water Pressure Tanks

In addition to the size tanks mentioned, other sizes are available and the following comprise some of the line.

Capacity, gal.	Dimensions, in.		Ship. wt., lb.	Capacity, gal.	Dimensions, in.		Ship. wt., lb.
	Height	Dia.			Height	Dia.	
3	12	8	13	220	72	30	425
10	20	12	33	315	72	36	498
25	30	16	60	530	120	36	732
42	48	16	100	1000	144	42	1756
80	60	20	180	1500	192	48	2608
120	60	24	260	1880	240	48	3129

Tanks up to and including 220-gal. capacity are heavy galvanized type. Tanks above that capacity are black.

All sizes are designed for a working pressure of 75 lb. per sq. in. and are tested at 150 lb. hydrostatic.

Albatross Fire Hose Steel Cabinets

These cabinets are constructed of heavy gauge copper-bearing, rust-resisting furniture steel.

Each side, top and bottom, including the facing and the flange, are constructed of one piece of steel without joints.

These sections are then mitered, heavily reinforced at the corners and welded, thus providing an especially rigid and durable construction.

Doors—The doors are of hollow metal.

The front and back sections are stamped from one piece of steel.

There are no mitres in the corners.

They are fitted with double strength crystal glass, but plain plate glass or beveled plate glass may be specified at a slight additional cost.

Inlets—Inlets for the pipe valves are not provided in the cabinets, location of same being left to suit the individual job, and are easily provided by

Steel Fire Hose Cabinet, Recessed Type

the plumber at time of installation.

Cabinet No. 7000

This cabinet is more heavily constructed than Nos. 7001, 7002 or 7003, and is considerably deeper, so as to provide space for fire extinguisher can.

Standard Finish—Is baked white enamel, but cabinets may be supplied in shop coat only, at a small reduction. Special finishes will be supplied to order at slight additional cost.

Stencil Lettering

Stencil lettering, "Fire Hose," on the door, can be supplied at slight extra cost.

Products

GENERAL FIRE PROTECTION and STANDPIPE EQUIPMENT for interior and exterior use, comprising: Hose Racks and Reels; Fire Hose, linen and cotton rubber lined; Brass Hose Couplings, Valves and Nozzles; Steel Hose Cabinets; Fire Extinguishers; Brass Siamese Standpipe Connections; Hose Spanners, Fire Axes and other auxiliary equipment.

Facilities

Allen products include the most modern fire fighting appliances on the market. Over forty years' experience, harmonious co-operation with insurance companies and underwriters, coupled with a close study of their requirements, have enabled the W. D. ALLEN MANUFACTURING CO. to satisfy the most exacting specifications.

Literature and Co-operation

Our specification and detail brochure, No. 29A, "Allen on Interior Fire Protection," covering interior fire protection equipment in a most comprehensive way, will be mailed on request. Correspondence is also invited and our service department will co-operate in furnishing special data and information.

Bowes Hose Rack for Linen Hose

Regular Bowes Hose Racks are accepted in practically every city. However, certain municipalities require, and when in doubt specify, Bowes Underwriters' Labeled Semi-Automatic Hose Rack; this is accepted everywhere and also assures lowest insurance rates.

The Bowes Rack enables anyone to get water to the fire in the fewest seconds, is positive in action, efficient and simple in operation and practically "fool-proof." Finishes are duco, aluminum or gold bronze. Duco Red finish is optional. Also Nickel Plate or Chrome on steel or brass.

As unlined linen hose is simply a flexible woven fabric, the normal folds along the edges and the easy bends following installation in an Underwriters' Hose Rack do the hose no injury. Dampness and mildew are the chief enemies of unlined linen hose and when properly hung in a Bowes Rack the circulation of air between the loops prevents deterioration.

Bowes Hose Rack Alenco
Fig. 139

Fire Hose Reels (Unapproved)

Used in 1897

This illustration is from our catalogue printed in 1897, and while we still manufacture hose reels, we no longer recommend them for unlined linen hose. Up to this date no fire hose reel has been approved by the National Board of Underwriters, and credit cannot officially be given for their installation.

The normal method of operating a fire hose unit is to open the valve, grasp the nozzle and proceed to the fire. In the case of a hose reel, when the water is released it dis-

tends the hose, presses against the yoke of the reel, acting as a hydraulic brake, thus preventing the reel from revolving and defeating the purpose of the installation.

Underwriters' Unlined Linen Hose

Made in two grades, both approved and accepted by all municipal codes. Specify Flax Line Linen Hose with Underwriters' yellow label or Flax Tow Linen Hose with Underwriters' green label, properly coupled in lengths not longer than 50 ft. with Alenco Fig. 97, 12 in. brass nozzle attached.

Hose Valves

Under the recent ruling of the National Underwriters' Associations angle valves are now accepted for all classes of standpipe work. They are preferred on account of the absence of leakage and in the average installation they lend themselves to a more compact hose unit.

For pressures up to 100 lb. specify Alenco 100 lb. (angle) valves.

For pressures 100 to 150 lb. specify Alenco 150 lb. Underwriters' (angle or gate) valves.

For pressures 150 to 250 lb. specify Alenco 250 lb. Underwriters' (angle or gate) valves.

Pressures over 100 lb. should have the nozzle pressure reduced by means of restricting orifices placed inside the coupling.

of Alenco Hollow
Metal Steel Fire
Hose Cabinets**

amel inside with heavy priming coat outside to be finished on the job. Cabinets may be furnished with any color or grained to match any particular trim. Specify Alenco Hollow Metal with (Plate) or (DSA) glass panel.

Alenco Duo Panel Cabinet

Has bevel plate glass panel in upper portion of the steel cabinet door instead of full glass door. May be furnished on any Alenco Hollow Metal Hose Cabinet.

Nella Sheet Steel Hose Cabinet

Regular commercial type, made from 12 and 16 gauge steel and may be specified instead of the Alenco Hollow Metal Steel Cabinet.

Alenco Duo Panel Door—Fig. 220A

First Aid Fire Extinguisher

Underwriters' Approved 2½ gal. Soda and Acid Fire Extinguishers are required in most types of buildings. Many city ordinances call for their installation charged and ready for instant use before the building is occupied. Extinguisher may be hung on brackets with the upper rim five feet from the floor, or installed in an extinguisher steel cabinet (specifications on request), or placed in cabinets with the Fire Hose Unit.

For ordinary occupancy specify one Fig. 3080 First Aid Extinguisher to every 2500 square feet of floor area, and so arranged that one is always available within 35 ft.

Fig. 3080

Minimum Hose Unit Requirements

Buildings 4 Stories or Less in Height—The recommended standard equipment is a 1½-in. valve with 1½-in. hose attached. In this class of buildings the fire department would fight the fire from the outside with their own equipment and the installation of a 2½-in. valve is, therefore, unnecessary.

Buildings 5 Stories or More in Height—Standard practice provides a 2½-in. valve for the use of the municipal fire department, and 1½-in. hose for the use of the occupants of building. This hose to be attached to the 2½-in. valve outlet by means of a Fig. 2113 reducing coupling.

Buildings 5 Stories or More in Height. New York Standard Requirements—In some cities 2½-in. hose is insisted upon by municipal authorities. When large hose is used, however, the matter of excessive pressure should be guarded against.

With or without Alenco hollow metal hose cabinet.

Specifications—Furnish and install where shown on plan, one Fig. 139 Bowes Hose Rack with (50, 75 or 100 ft.) Underwriters' yellow or green Labeled Linen Fire Hose (1¼, 1½, 2 or 2½ in.) properly coupled in lengths not over 50 ft., with a Fig. 97 12 in. plain Hose Nozzle attached; all to be supported on a Fig. 171 (100, 150 or 250 lb.) Angle Hose Valve (1¼, 1½, 2 or 2½ in.) and Nipple. If 2½ in. hose valve, specify outlet to be threaded to agree with local fire department thread. If a 2½-in. Valve with 1½-in. hose is to be used, specify the 1½-in. hose to be connected to the 2½-in. Valve Nipple with a Fig. 2113 Reducing Coupling. If equipment is to be installed in hose cabinet, specify a Fig. 262 Alenco Steel Hose Cabinet having (Plate) or (DSA) (Full glass door) or (Duo Panel door).

Architects' Note: Cabinet is large enough to hold a quart Allen's "Reddy" Hand Fire Extinguisher which is a valuable first aid adjunct.

Alenco Fire Hose Unit 8B, Cabinet 190

Used only when the valve inlet is from the back.

Chicago standard with two hose gate valves with or without hollow metal hose cabinet.

Specifications—Furnish and install where shown on plans: one Fig. 139U Bowes Underwriters' Labeled Semi-Automatic Hose Rack, (50, 75 or 100 ft.) of 1½ in. Underwriters' (yellow) or (green) Labeled Fig. 97 12 in. plain Hose Nozzle, attached; one First Aid 2½ Gal. Underwriters' Approved Soda and Acid Tip-Over Type Fire Extinguisher, Fig. 3080, complete, charged and ready for instant use; one Fig. 20 Alenco Underwriters' Approved Fire Axe with brackets. One 2½x1½ in. combination spanner with brackets. At each point where indicated on plans install one Gate Valve, Fig. 358 (100, 150 or 250 lb.) with bronze cap and chain, for the exclusive use of the fire department, and one 1½ in. Alenco Underwriters' Pattern Hose Gate Valve (150 or 250 lb.) with ¼ in. drip. If equipment is to be installed in hose cabinets, specify Alenco Hollow Metal Hose Cabinet, Fig. 190, having a (Plate) or (DSA) (full glass door) or (Duo Panel door).

**Alenco Fire Hose Unit 9A, Cabinet 214**

With or without Alenco hollow metal hose cabinet.

Specifications—Furnish and install where shown on plan, one Fig. 139 Bowes Rack with (50, 75 or 100 ft.) of 1½ in. Underwriters' (yellow) or (green) Labeled Linen Fire Hose properly coupled in lengths not over fifty feet with one Fig. 97, 12 in. plain hose nozzle attached; all to be supported on a 1½ in. Fig. 171, Angle Hose Valve (100, 150 or 250 lb.) and Nipple. One Fig. 170, 2½ in. Angle Hose Valve, with outlet threaded to match city fire department standard. If equipment is to be installed in cabinet, specify a Fig. 214 Alenco Hollow Metal Hose Cabinet having (Plate) or (DSA) (full glass door) or (Duo Panel door).

Alenco Fire Hose Unit 1A, Cabinet 192, Chicago Std.

Two angle valves with or without steel hose cabinets.

Specifications—Furnish and install where shown on plan, one Fig. 139 Bowes Semi-Automatic Underwriters' Labeled Rack with (50, 75 or 100 ft.) 1½ in. Underwriters' (yellow) or (green) Labeled Linen Fire Hose, properly coupled in lengths not over 50 ft. with one Fig. 97, 12 in. plain hose nozzle attached; all to be supported on a 1½ in. Fig. 171 Angle Hose Valve (100, 150 or 250 lb.) with Nipple. One Fig. 170, 2½ in. Angle Hose Valve (100, 150 or 250 lb.) with outlet threaded to match city fire department thread; the 2½ in. valve to be protected with cap and chain. One First Aid Underwriters' Approved Fig. 3080 Soda and Acid Tip-Over type 2½ gal. Fire Extinguisher complete, charged and ready for instant use. One Fig. 20 Alenco Underwriters' approved fire axe with brackets and one Fig. 5, 2½ in. and 1½ in. combination spanner. If equipment is to be installed in hose cabinets, specify a Fig. 192 Alenco Hollow Metal Hose Cabinet having (Plate) or (DSA) (Full glass door) or (Duo Panel door).

ers' Labeled Rack with (50, 75 or 100 ft.) 1½ in. Specification for Siamese Connection—Run main .. in. pipe line from standpipe to street at front wall as directed, attach a Fig. .. W. D. ALLEN MANUFACTURING Co.'s double clapper Siamese with plugs or caps, with bronze plate with proper wording. On inside of main wall, located where frost can not affect it, not less than 10 ft. from wall, place .. in. check valve, to check against house tank or pump pressure, with automatic ball drip, placed at lowest point between check valve and Siamese connection. Means of draining risers shall be provided.

Concealed Flush Type Siamese Control Valve and Wall Hydrant

Fig. 283. Siamese (inlet) with Sill Cock (Pat. App. for)

Fig. 274S. Hydrant Control Valve

Fig. 276WH. Wall Hydrant (Outlet)

Fig. 276. Siamese, (inlet) Without Sill Cock. Can be substituted for Fig. 283 (Patent Applied for)

Concealed (or Flush) Type Siamese—Designed to solve the problem presented by the restricted sidewalk space in crowded metropolitan districts. The body of the Siamese with its two independent self-closing clapper valves can be built into wall of the building during construction. When the building is completed, the plate and the two independent swivel inlets are attached to the body of the Siamese by means of the required length pipe nipples. The Siamese is made of bronze, extra heavy throughout and will last as long as the building.

Specify—No. 283 Siamese with Sill Cock. Complete with plugs and chains.

(2 1/2 x 2 1/2-in. inlets, by 4-in. outlet.)

(2 1/2 x 2 1/2-in. inlets, by 6-in. outlet.)

(3x3-in. inlets by 6-in. outlet.)

Or specify in place of No. 283, No. 276 Siamese without Sill Cock. Complete with plugs and chains.

(2 1/2 x 2 1/2-in. inlets, by 4-in. outlet.)

(2 1/2 x 2 1/2-in. inlets, by 6-in. outlet.)

(3x3-in. inlets by 6-in. outlet.)

Dimensions—(For 2 1/2 x 2 1/2 x 4 in.). Write for larger sizes.

Fire Department Control Unit—For private high pressure systems. In addition to the regular Siamese, a wall hydrant outlet and exterior valve control will make the private high pressure system in a building available for the fire department. The fire department can pull up to the building, attach one or two leads of hose to the hydrant and with their wrench (which is the same as used on the corner fire hydrants), turn the stem (from the outside) and automatically start the Underwriters' fire pumps in the basement.

Be sure that at least 6 inches is allowed between the bottom of the sill cock and the ground for attaching hose.

Additional Information

Our Data Book "Allen on Interior Fire Protection," containing complete specifications and working drawings on standpipe installation, is yours for the asking. It contains information not heretofore available in print. The various tables are the result of forty years of experience together with informa-

tion from the best architects and engineers in the country. The book is informative rather than purely promotional and should be in your draftsman's hands. Write to W. D. ALLEN MANUFACTURING Co., 566 W. Lake Street, Chicago, Ill., to 69 Warren Street, New York, N. Y., or to the branch offices.

Satisfy Mechanical and Artistic Requirements for Modern Buildings

The manufacture of "Lightning" fire hose racks and cabinets was begun almost a quarter century ago to help meet the urgent demand for efficient fire protection equipment in the modern buildings about to be constructed on the ruins of old San Francisco. We believe that today there is more fire protection equipment of "Lightning" brand installed on the Pacific

Coast than that of all other makes combined. This equipment is mechanically correct, complying with Underwriters' requirements and with all municipal building codes on the coast.

In addition to mechanical efficiency, "Lightning" equipment possesses the artistic merit demanded in modern buildings.

"Lightning" Racks for Linen Fire Hose Afford Sure Protection

Operation—A jerk of the nozzle releases the hose, which is then delivered as rapidly as desired, but fold by fold. It cannot become entangled in the frame or drop to the floor in a heap. This is due to the operating principle on which the construction of the "Lightning" hose rack is based.

Construction—The frame of the hose rack is made of the finest grade cast metal, either gray iron or brass. It is accurately machined and drilled so the rack will not sag under the weight of the hose. The hose supporting rods are accurately formed

"Lightning" Hose Rack

on a punch press to insure uniformity of operation; they are heavily galvanized and will not rust.

Methods of Hanging—With Nipple Attachment—The rack illustrated is supported from the valve with a "Lightning" valve nipple, which also acts as a hinge, allowing the rack to swing the full 180°. This assembly is the most popular in the West because of the simplicity of installation and neatness of appearance.

With Wall Bracket or Pipe Clamp Support—We also supply a wall bracket or a pipe clamp support for this rack for use in installations where it is inconvenient

or undesirable to use our standard nipple attachment. **Finishes**—"Lightning" hose racks are carried in stock in the following finishes: Enamel (any color), bronzed (aluminum or gold), nickel plated, chromium plated and brass plated. There is only a slight extra charge for special finishes.

*Add 4 in. to "A" and "B" for recess.

"Lightning" Saddle Racks Adapted to Frequent Use for Inspections and Drills

Saddle racks are recommended for use in school buildings, theaters, etc., where hose must be taken from rack frequently for inspections and fire drills.

Artistic Treatment—In the designing of this rack we have endeavored to fulfill the demand for a saddle rack that harmonizes with the surrounding architecture and color scheme.

H. J. M. HOWARD MANUFACTURING CO.

Manufacturers of Hose Racks and Fire Protection Devices

148-150 Pierce Street, N. W.
WASHINGTON, D. C.

TELEPHONE: NATIONAL 8017

Products

FIRE PROTECTION DEVICES, including Peerless Swinging Hose Racks, Hose Couplings, Hose Pipes, Unlined Linen Hose.

Also Howard Chemical Fire Extinguishers and Cabinets.

Peerless Swinging Hose Rack

A very important feature of this rack is the fact that the operator can turn on the water before removing the hose. No ordinary force of water can possibly force the hose from the rack; it must be removed by the operator.

Peerless Racks for 1½-in. hose are approved by the Underwriters and will be labeled when so required and ordered.

Specifications

On each floor where indicated, at a height of 6 ft. above the floor, install a 2½-in. brass angle valve with brass milled edge wheel, removable soft disk for cold water, and 50 ft. of 2½-in. labeled Underwriters' linen hose with patent expansion ring couplings and 2½x12-in. hose nozzle with 7/8-in. outlet attached.

Hose to be supported on solid brass Peerless Swinging Hose Rack, as manufactured by the H. J. M. HOWARD MANUFACTURING Co., Washington, D. C.

All metal parts to be brass, heavily nickelplated and polished all over.

(Change length of hose, sizes and finish to suit requirements.)

To be incorporated in specifications where cabinets are required:

Each fire hose outfit to be installed in a Howard [steel] [kalamein] [wood] cabinet of proper size to accommodate the outfits herein specified.

State whether cabinets are to be finished with priming coat only or completely enameled.

Cabinets

We make and furnish all types of cabinets: steel; Kalamein; and wood; with large glass panel doors, two panels or solid steel panel. Cabinet doors of flat metal or hollow type. Flat metal doors are less expensive and much more durable.

INSIDE DIMENSIONS OF CABINETS

Length of hose, ft.	Height, in.	Width, in.	Depth, in.	With extinguisher	
				Width, in.	Depth, in.
50	28	18	7	26	8½
75	30	21	7	29	8½
100	38	22	7	30	8½

Note: Allow ½ in. all around for wall opening.

ELKHART BRASS MFG. COMPANY

Manufacturers of Inside Fire Protection

ELKHART, IND.

Products

Complete Equipment for Inside Fire Protection: FIRE DEPARTMENT SUPPLIES, CHEMICAL FIRE EXTINGUISHERS.

Experience and Facilities

With our large modern factory and foundry and many years' experience, we are prepared to furnish highest quality equipment all guaranteed by the Elkhart registered trade-mark.

Distribution

Elkhart products are known and sold throughout the United States and Canada.

Elkhart equipment is a distinctive feature of many of the largest and finest buildings erected in the United States in recent years. Throughout the Middle West and South you will find our beautiful designs giving efficient service everywhere.

For Your Convenience

Blue prints and additional data gladly furnished on request.

Elkhart Hose Racks

The phantom view of hose rack shows channel pin support. Also note the curved spring attached to top of rack at left corner. This prevents pins from accidentally falling and releasing hose. The large loop on the pins promotes ease of operation and eliminates possibility of jamming.

Phantom View of Elkhart Rack
Plate 41, 42 and 45

(W) wall bracket, (C) combination wall bracket and escutcheon for use with gate valves.

These features apply to plates 41, 42 and 45 illustrated and described below.

Finish of Elkhart Hose Racks—Aluminum bronze, gold bronze, red lacquer, dead black or white enamel optional. Also furnished in nickel, brass, chromium and flat black plated, and in solid brass polished.

Methods of Attachment for All Elkhart Racks—Style (N) nipple, (P) pipe clamp,

Elkhart Underwriters' Labeled Hose Racks

Semi-automatic, Plate 41 (Patented)—Similar in appearance to Plate 45.

For 1¼ and 1½-in. unlined linen hose. Rack is sturdily built of one piece of pressed steel fastened to cast back.

The semi-automatic feature of this rack permits one to open the valve at once in case of fire and drag the hose by the nozzle right to the flames, because the last fold of the hose holds back 150 lb. water pressure. This feature makes the semi-automatic type of hose rack decidedly superior to non-automatic racks from which the hose must be entirely removed before the valve may be opened, causing a delay in reaching the fire that may prove disastrous.

Another advantage of this type of rack is that nothing serious can happen if the valve is opened accidentally or maliciously. It is therefore the correct type to specify for school and college buildings, etc.

Non-automatic, Plate 42—For 2 and 2½-in. unlined linen hose.

Rack is similar in construction to Plate 41 but without the semi-automatic feature. Fully approved and labeled.

Elkhart Covered Hose Rack

For 1½, 2 and 2½-in. linen hose. Plate 45 hose rack is similar in construction to Elkhart Underwriters' racks, Plates 41 and 42, but does not have either the semi-automatic feature or the Underwriters' label.

We invite comparison of our covered type of hose rack with other racks of similar appearance.

The body, together with the channel for supporting the pin, is formed from one piece of heavy furniture steel, which not only provides a very strong pin support but reinforces the entire rack. The solid top protects the hose from dust and controls its release. We have also given special attention to finish. The result is a handsome and efficient rack, acceptable in all installations where an Underwriters' label is not required. Also made with semi-automatic feature (Factory Mutual approved). Approved by Board of Standards and Appeals, New York, N. Y.

Plate 45

Elkhart Hose Valves

Elkhart-Crocker Pressure Reducing Valve (Patent Applied For)—Approved by National Board of Underwriters.

Designed for installation between hose valve and linen hose. Each valve set and locked so that nozzle pressure on each floor is restricted to 50 to 60 lbs. as desired, regardless of standpipe pressure.

Cannot be tampered with by the occupants of the building but may be easily operated by firemen to any desired flow by means of spanner wrench.

The only approved pressure controlling device that:

Opens allowing full, unrestricted waterway.

Is calibrated for standpipe pressure variations as low as 5 to 10 lbs.

Elkhart Underwriter Angle Valves—Angle valves are now approved by the National Underwriters' Association for all standpipe work. They are more satisfactory

than gate valves, as they are absolutely tight under all conditions.

As the hose rack can be directly attached by means of a nipple, the unit is more compact, and a smaller cabinet can be used than with gate valves.

Elkhart angle valves are specially designed for inside fire protection and high pressure work.

Plates 20U and 25U are made to Underwriters' specifications and approved in 1½ and 2½-in. sizes for 150 and 250-lb. pressure.

Elkhart Angle Valves—

Plates 20 and 25 are made in standard and extra heavy weights, acceptable in all cases where Underwriters' valves are not required.

Bronze Hose Gate Valves—Plate 88 is for use with inside standpipe. Has stationary stem, adjustable double disc. Every valve tested before leaving the factory. Standard weights, also extra heavy.

Plate 26

Plate 20U

Plate 88

Plate 25 Plate 20

CONSTRUCTION FEATURES AND STYLES OF ALL ELKHART STEEL HOSE CABINETS

(Pressed Steel with Hollow Steel Door and Trim)

The sectional view shows the construction of Elkhart cabinets which are made of heavy rust resisting furniture steel. Door and trim are made from special hollow rolled and welded tubing. The corners are mitered and electric butt-welded with no seam showing. This is the last word in cabinet construction and results in a strong and rigid door frame. The frame actually reinforces the glass rather than the glass stiffening the door frame. This added strength reduces glass breakage to a minimum.

Sectional View Showing Sturdy Construction

Knockout holes for inlet are partially punched as specified.

Dustproof construction, concealed hinges, ball and spring catches, polished plate or DSA glass complete this beautiful cabinet.

Standard finish is white baked enamel inside, white prime coat outside. Other finishes can be furnished when desired.

Any size cabinet can be furnished on order.

Three butt type hinges furnished on large cabinets.

Style S for Surface Mounting

Surface type or outside wall cabinet. Any Elkhart cabinet can be made up in this style, which is necessary where the depth of the wall is not sufficient to recess the cabinet in the usual way. Door is furnished with DSA or plate glass panel or with duo-panel when desired. Trim $1\frac{1}{2}$ in. wide. For outside dimensions add $3\frac{3}{4}$ in. to inside measurements.

Style E Elkhart Double Door Cabinet

The ultimate in cabinet design because:

Hose more readily accessible in either direction.

Doors open in smaller space.

Less possibility of glass breakage.

Design more in keeping with modern interiors.

Lever handle bolts both doors securely at top and bottom.

Style D with Duo-panel Door

Recessed type, as shown, or surface type. The duo-panel door, having steel section at the bottom and plate glass panel at top, affords some protection against breakage of glass.

This type of door is for use where the cabinet is in an exposed position.

It can be furnished on any Elkhart cabinet

HOSE UNIT WITH ONE ANGLE VALVE (PLATE C-910)

SECTION

PLAN

DETAIL

For This Unit Specify

Elkhart standard cabinet, plate C-910.

Elkhart angle valve, plate No. 20 or plate 20-U.

Elkhart covered hose rack, plate No. 41 or 45, Style N with nipple.

The specified length of Underwriters' labeled linen hose of the proper size.

Elkhart polished brass expansion ring couplings and 12-in. plain nozzle.

Similar Units—Hose unit with two angle valves, plate C-920 and hose unit with two gate valves, plate C-925. See Elkhart catalogue No. 29 for dimensions.

Note: In buildings not over four stories high $1\frac{1}{2}$ -in. valve and $1\frac{1}{2}$ -in. hose are recommended. In buildings five or more stories high, a $2\frac{1}{2}$ -in. valve with local fire department thread should be installed to which $1\frac{1}{2}$ -in. linen hose can be attached by means of $2\frac{1}{2}$ x $1\frac{1}{2}$ -in. reducing coupling, plate 335.

HOSE UNIT, CHICAGO STANDARD, WITH TWO ANGLE VALVES AND EQUIPMENT (PLATE C-901)

For This Unit Specify

Elkhart cabinet, plate C-901.

Elkhart 1½-in. approved angle valve, plate 20-U for 150 or 250 lb. pressure as required.

Note: If necessary to reduce pressure use 1x1½-in. Underwriters' valve instead of straight 1½-in.

Elkhart 2½-in. approved angle valve, plate 25-U, for 150 or 250 lb. pressure with local fire department thread, and with bronze cap and chain.

Elkhart semi-automatic Underwriters' approved hose rack, plate 41, Style N with 1½-in. nipple.

The specified length of 1½-in. Underwriters' labeled linen hose with Elkhart expansion ring couplings.

Elkhart 1½x12x½-in. plain nozzle with lugs.

Elkhart 2½-gal. Underwriters' approved fire extinguisher complete with charge.

Fireman's pick head axe with Underwriters' bracket No. 3.

Elkhart taber spanner with Underwriters' bracket No. 4.

For complete description of Elkhart steel hose cabinets see preceding page.

(For Same Unit with One Valve C-916)

HOSE UNIT, WITH TWO GATE VALVES AND EQUIPMENT (PLATE C-900)

PLAN

DETAIL

For This Unit Specify

- Elkhart cabinet C-900.
- Elkhart 2½-in. gate valve, standard weight or extra heavy with cap and chain.
- Elkhart 2½-in. extended type escutcheon, plate 588.
- Elkhart 1½-in. gate valve, standard weight or extra heavy with ¼-in. drip cock.
- Elkhart 1½-in. combination wall bracket and escutcheon, plate 500, which fits back of valve and supports the rack.
- Elkhart Underwriters' approved semi-automatic hose rack, plate 41.
- Enough 1½-in. Underwriters' labeled linen hose to reach every part of the space served, coupled with Elkhart expansion ring couplings, in sections not over 50 ft. long.
- Elkhart 1½x12x½-in. plain nozzle with lugs.
- Fireman's pick head axe with bracket, No. 3.
- 2½-in. taber spanner with bracket, No. 4.
- Elkhart 2½-gal. Underwriters' approved fire extinguisher.

SIAMESE CONNECTIONS; FIRE EXTINGUISHERS

Siamese with Sill Cock (Plate 165) (Patented)

This siamese is flush with the wall and takes the minimum of space on a crowded sidewalk. The body is built into the wall during construction. The wall plate is attached when desired by simply screwing in the bronze inlet nipples to which the independent clapper valves are attached.

This feature of construction is very important, as it eliminates a serious drawback to the use of this type of siamese. Should any trouble develop, the clapper valves can be easily removed for repairs. Where the clappers are permanently attached to body of siamese they are inaccessible as the body can not easily be removed after it is once built in.

Plate 165

DIMENSIONS, IN., PLATE 165
SIAMESE (4x2½x2½ in.)

----	----	----	----	----	----	----	----

*Height of body in wall.

Both can be furnished with pipe coming in from bottom, instead of back of body. Blue prints on request.

Same Design without Sill Cock (Plate 166)

Height 9½ in. Other dimensions same as plate No. 165 given in table.

Wall Hydrant Plate 163 and Valve Control Plate 164—Are of same design.

Emergency Tool Cabinet

Has solid metal door, with cylinder lock, red enameled with 3-in. white letters, fully equipped, size 18x40x4 in. For mounting on wall in pump room. Required by ordinance in New York, N. Y. A practical necessity in any large building, for storing spare standpipe fittings and tools.

Roof Manifolds

For 6 and 8-in. standpipe roof outlets, provided with three 2½-in. hose valves with male threads.

Combination Wall Plate Siamese with Sill Cock (Plate 155)

Made of highly polished bronze. Fitted with two 2½-in. fire department inlets and 4 or 6-in. outlet. Has double clapper valves, plugs and chains, also one ¾ or 1-in. outlet at bottom for sprinkling hose. Complete with hose cap, chain and key.

Plate 155

DIMENSIONS	
Greatest length.....	19 in.
Greatest width.....	12½ in.
Stands out from wall.....	10½ in.
Center of pipe opening to center of sill cock—	
With 4-in. pipe.....	9½ in.
With 6-in. pipe.....	10 in.

Wall Plate Siamese (Plate 156)

Same siamese as plate 155 without the sill cock.

DIMENSIONS	
Greatest height.....	11¼ in.
Greatest width.....	12½ in.
Stands out from wall.....	10½ in.

Plate 156

Fire Extinguishers

To protect property, and also to get lowest possible insurance rates, install Elkhart 2½-gal. fire extinguishers. Made of copper, highly polished and lacquered. Instantly discharged by simply turning upside down. Elkhart fire extinguishers are approved by the Underwriters' Laboratories, Inc., Chicago, Ill., and the Factory Mutual Fire Insurance Companies, Boston, Mass.

Style A Soda and Acid Style F Foam Type

Fire Extinguisher Cabinet

Same construction as hose cabinets. Inside dimensions 9x27x48 in. deep.

GRINNELL AUTOMATIC SPRINKLER SYSTEMS and other FIRE PROTECTION APPARATUS and DEVICES.

For Heating and Power Piping Installations, Pipe Fittings, Hangers and Accessories, Thermoliers (Unit Heaters), Thermoflex Heating Specialties, see Manufacturers' Index.

Grinnell Sprinkler Systems

Grinnell has been a leader in automatic sprinkler protection for nearly fifty years. Over 30,000,000 Grinnell Sprinklers have been installed and are safeguarding property valued at more than 10 billion dollars. The average loss per fire in Grinnell protected buildings in over 26,000 recorded fires is less than \$300, an estimated saving of over 90% as compared to the average fire loss in similar properties without sprinklers.

Types of Systems

- (1) **Wet-Pipe System**—With water in the pipes under pressure.
- (2) **Dry-Pipe System**—With air in the pipes under pressure.
- (3) **Deluge System**—With air in pipes under atmospheric pressure and using "open" sprinkler heads.
- (4) **Preaction System**—Similar to 3, but using closed heads.
- (5) **Simplex System**—Using a pressure tank, with air in pipes and the same air pressure in tank and system.
- (6) **Outside Open Head Systems (Water Curtains)**—For protection against exposure fires.

Features Common to All Grinnell Automatic Sprinkler Systems

A sprinkler equipment is attached to or concealed in the ceiling. When fire breaks out, the temperature at the ceiling rapidly increases and causes the fusible strut of the solder type sprinkler head to melt, or the bulb of the quartz bulb sprinkler head to burst. This allows the water to emerge from the sprinkler head in a heavy spray onto the fire.

Grinnell Automatic Sprinkler heads are of two general types—Solder Type and Quartz Bulb Type—and when installed are located a few inches below ceiling and spaced from 8 to 12 ft. apart, depending on fire hazard conditions. The piping on which sprinklers

are located is fed by upright riser pipes controlled by shut-off valves. Water supply of adequate volume and pressure is obtained from various sources, such as city water mains, elevated gravity tanks, pressure tanks, reservoir, or pumps.

The sprinkler heads are designed to operate automatically at temperatures of 135 degrees or more according to conditions and the water is distributed over the area protected by each sprinkler.

An automatic alarm is sounded when a sprinkler head goes into operation.

Wet-Pipe System

Pipes are full of water under pressure. When sprinkler operates, water is at once discharged on the fire. Buildings having wet-pipe systems must be heated throughout in cold weather to prevent water in pipes from freezing.

Dry-Pipe System

These systems are used in buildings or portions of buildings where a wet-pipe system could not be used because of danger of freezing. A Grinnell Dry-Pipe Valve is used, holding back the water, with air in pipes under pressure. When sprinkler head operates, the air pressure drops and water automatically enters system and is discharged from the sprinkler head. The Grinnell Dry-Pipe Valve is equipped with a Grinnell Accelerator which causes the dry-pipe valve to trip and admit water to the system almost instantaneously, thereby reducing the delay in water reaching the sprinkler head to a minimum. The air pressure is maintained by an air compressor that can be arranged to operate automatically if desired.

Deluge System

Open heads are used and the water supply is controlled by a Deluge Valve which in turn is operated by a thermostatic system of heat actuated devices located on ceiling. The heat actuated devices are very sensitive to heat from fire and almost immediately after fire starts, the Deluge Valve trips and water is at once discharged from all the open heads in area or room, thus "deluging" the fire. This system can be used to advantage where the fire hazard is severe and quick action necessary, such as inflammable liquid spraying, manufacture or use of extra hazardous liquids or compounds, airplane hangars, etc.

Preaction System

In this type of dry-pipe system, a thermostatically controlled Deluge Valve is used as for Deluge Systems. Regular automatic sprinkler heads are used and there is no water in the pipes. No air pressure is maintained as with the ordinary dry-pipe systems. The sensitive heat actuating devices on the ceiling cause the Deluge Valve to trip and admit water to the piping system before the automatic sprinkler head operates. An alarm is given when the Deluge Valve trips and there may be sufficient time to extinguish fire by other means before the sprinkler operates. This system is especially adaptable to properties with unusually valuable contents, where the danger of any damage by water must be avoided, such as museums, art galleries, printing establishments, cold storage plants, etc. It is also designed for use in asylums, prisons, hospitals, or similar properties where inmates may intentionally injure the piping system.

Simplex Dry - Pipe System

This is a simplified type of system having a pressure tank for a water supply. There is no dry-pipe valve and the same air pressure is automatically maintained in the tank and system. It is especially intended for use in properties where the fire hazard is not severe and where city water is not available. This would include hotels, clubs, institutions, large dwellings, and similar properties. It is less expensive to install and easy to maintain. The tank can be located in the basement and this is the only part of the system that needs to be heated.

Outside Open Head Systems (Water Curtains)

Special types of Grinnell "Open" Sprinklers are used and located outside of building, over each window, at eaves, or on roof, as a protection against outside exposure fire. They are connected to a system of piping with adequate water supply, such as city water or pumps. The water is normally shut off and is turned on when needed. These systems are of great value in preventing an outside fire from entering the building.

Grinnell Quartz Bulb Sprinkler

This sprinkler was first brought out about eight years ago and it has many advantages over the ordinary solder type sprinkler. An entirely new principle is used, solder is discarded, and in its place a quartz bulb partially filled with a special colored liquid is used. It can be manufactured to operate at any desired temperature and the ordinary or "low" test sprinkler operates

at 135° as compared to the 160° solder type. The Grinnell Quartz Bulb Sprinkler is more sensitive or quicker to operate than the solder type and it is to be preferred where prompt operation is necessary because of severe fire hazard or danger of fire spreading quickly. This new type is not subject to failure from corrosion as is the solder type. The bulb itself is non-corrosive and the rest of the sprinkler can be lead coated or otherwise protected. Chemical and other plants where severe corrosive conditions exist can now have sprinkler protection because of the Grinnell Quartz Bulb Sprinkler Head. It also is not affected by "loading" or "gumming" from dust, varnish fumes, paint, etc.

Grinnell Quartz Bulb Sprinkler Heads are specified in many cases because of their unusually attractive appearance.

Several hundred thousand of Grinnell Quartz Bulb Sprinkler Heads have been installed and experience has shown that not only are they preferable for general use, but are especially desirable where quick action is necessary or where the sprinklers are subject to corrosive influences, loading, or gumming.

Installation

Grinnell Automatic Sprinkler Systems are factory-assembled to blue prints, fittings being made-on as far as possible by machinery. The result is that the equipment is delivered ready for quick and botherless installation by our highly trained erecting crews. This reduces interference with usual plant operation to a minimum.

Designs and Estimates

Inquiries addressed to the executive offices of GRINNELL COMPANY, INC., or to any of the offices will immediately receive the attention of the engineering staff, who will promptly furnish expert advice with designs or estimates as required, without cost or obligation.

Sprinkler Supervisory Service

A safeguard of the dependability and efficiency of an Automatic Sprinkler System is provided by the A.D.T. Central Station System of Sprinkler Supervisory Service.

Day and night this service automatically and continuously supervises all the vital parts of the Sprinkler System. It eliminates human carelessness by an electric equipment which automatically transmits signals to a central station, indicating any trouble that might make the system inoperative. This A.D.T. Central Station System of Sprinkler Supervisory Service is described in detail in another section of SWEET'S CATALOGUE. See Manufacturers' Index.

THE JIFFY FIRE HOSE RACK CO.

Manufacturers of Complete Interior Fire Extinguishing Equipment

133 West 52nd Street
NEW YORK, N. Y.

Products

HOSE RACKS, HOSE CABINETS, SIAMESE CONNECTIONS, FIRE HOSE VALVES, CHEMICAL FIRE EXTINGUISHERS.

Also Nozzles, Underwriters' Unlined Linen Hose, Couplings, Axes, Pails and Accessories.

TRADE-MARK

"Jiffy" fire hose racks are neat and attractive in appearance and can be had in small compact sizes for country residences and private homes.

They are so simple in operation that a maid or child can handle them. Non-corrosive, will not rust.

Materials

"Jiffy" appliances are made in malleable iron (bronzed) or of brass, and in any style finish as required.

Hose Racks

Principle of Operation—The comb of the "Jiffy" fire hose rack holds the hose in position ready at all times for instant release. A pull upon the nozzle releases the arm holding the comb, letting the hose fall to the floor.

Advantages of "Jiffy" Fire Hose Racks—Always ready for immediate use. Automatic in operation; pull the nozzle and turn on the water.

No loose parts to become lost or broken. No metal rings or links to be dragged over furniture or caught on trim.

So constructed as to permit a free circulation of air around the hose, keeping it dry and in reliable condition.

Hose rack attached to extension piece showing 50 ft. of 2 in. hose released from height of 6 ft. by layman. Note orderly layout of hose.

Standpipe and Hose Equipment Specifications

Standpipe—Where shown on plans, furnish and erect standpipe with necessary check valves, shut-off valves and Siamese connections, properly connected to meet requirements of Fire Prevention Bureau and governing departments.

Hose Equipment—Where shown on plans, furnish and install "Jiffy" nickel-plated brass angle hose valve, nickelplated milled wheel, "Jiffy" Type ("A," "B" or "C") improved hose rack with ... ft. (1½, 2, 2½-in.) St. Regis brand underwriters' labeled linen hose, nickelplated brass couplings and nozzles.

Note: Racks furnished in malleable iron aluminum or gold bronzed, enameled in color or nickelplated; also in brass polished or nickelplated.

DIMENSIONS OF "JIFFY" FIRE HOSE RACKS

Diam. of hose, in.	Length of rack, in.		
	25 or 50 ft. of hose	75 ft. of hose	100 ft. of hose
¾	18	21	26
1	18	21	26
1½	18	21	26
2	18	21	26
2½	18	21	26

Measurements from center of pipe to end of nozzle holder.

Measurements allow hose to hang down 26 in. If limited for wall space, a 50-ft. rack can be used for 75 or 100 ft. of hose by hanging hose on racks in longer loops.

Comb ready to receive hose.

Comb ready to receive hose.

"JIFFY" FIRE HOSE RACKS
TYPES A - B & C

Specifications for "Jiffy" Fire Hose Rack Equipments

Note: The following blanket specification covers our entire equipment. The sizes of the various units should be selected to fit the requirements of the Local Fire Department and Fire Prevention Bureau.

Specification—Furnish (and install) where shown on the drawings, a [2½] [2] [1½] [1¼]-in. [nickelplated polished brass] [nickelplated brass] [rough brass] [angle] [gate] hose valve with [nickelplated brass] [nickelplated iron] [iron painted or enameled any color] wheel.

Furnish (and attach) a "Jiffy" Type [A] [B] [C] [nickelplated brass] [nickelplated] [baked enameled—any color] [aluminum painted malleable iron] hose rack with [50] [75] [100] ft. [2½] [2] [1½] [1¼]-in. St. Regis Brand Underwriters' Labeled Unlined linen hose.

Furnish (and attach) a [2½x15] [2x11] [1½x10] [1¼x10]-in. [nickelplated brass] [aluminum painted iron] hose nozzle and nickelplated brass [couplings] [reducing couplings].

Note: The above mentioned gate valves can be furnished with ¼-in. drip cocks.

Where Separate Valve Outlets are Required by Local Fire Departments

Note: In addition to the specification above, following is a blanket specification covering a separate valve installation for Local Fire Department.

Specification—Furnish (and install) where shown on the drawings a 2½-in. nickelplated polished brass [angle] [gate] hose valve with nickelplated brass milled wheel and nickelplated brass cap and chain, having Local Fire Department thread.

Hose Cabinets

The "Jiffy" hose cabinet has been designed to fit a need for a cabinet to accommodate the "Jiffy" rack and equipment.

The "Jiffy" hose cabinets are made in iron or in other metal, either painted, enameled any color or plated as desired.

They are constructed of No. 16 gage metal, with No. 12 gage metal trim and door. The door is provided with polished plate glass panel. The hardware can be of concealed or exposed type as desired, and can be furnished to match adjacent hardware.

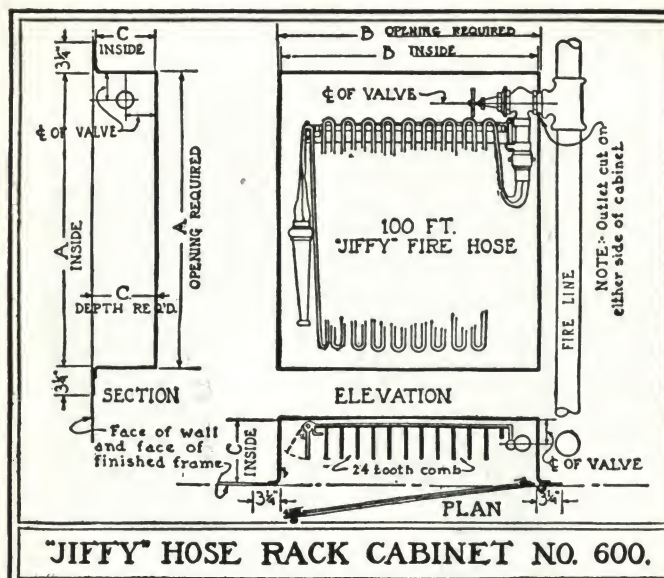

Closed Open
HOSE RACK INSTALLED IN CABINET

The equipments are arranged so that the roughing-in for the valves extends through the side of the cabinet.

The accompanying illustrations show the typical "Jiffy" cabinet closed and open. Note the neatness, the compactness and the accessibility of the equipment.

"Jiffy" cabinets can also be furnished to include a fire extinguisher, an axe and other accessories that may be required by Local Fire Departments and Fire Prevention Bureau.

Note: For details, specifications and dimensions, see following pages.

Specifications for "Jiffy" Fire Hose Cabinet

Plate No. 600—Furnish (and install) where shown on the drawings, a "Jiffy" Fire Hose Cabinet, No. 600, constructed of No. 16 gage steel, with No. 12 gage steel trim and door having polished plate glass panel, concealed hinges, concealed catch and pull handle. Finished at factory with a priming coat of white paint.

Furnish (and install) a 2½-in. nickelplated polished brass angle hose valve with nickelplated brass milled wheel.

Furnish (and attach) a "Jiffy" Type C nickelplated polished brass hose rack with 50 ft. 2½-in. St. Regis Brand Underwriters' Labeled Unlined linen hose.

Furnish (and attach) a 2½x15-in. nickelplated polished brass hose nozzle and nickelplated polished brass couplings.

Plate No. 601—Furnish (and install) where shown on the drawings, a "Jiffy" Fire Hose Cabinet, No. 601, constructed of No. 16 gage steel, with No. 12 gage steel trim and door having polished plate glass panel, concealed hinges, concealed catch and pull handle. Finished at factory with a priming coat of white paint.

Furnish (and install) a "Jiffy" Chemical Fire Extinguisher, No. 710, complete with charge, and Fire Axe with necessary brackets securely mounted.

Note: For balance of equipment shown on Plate No. 601 use the last three paragraphs of specification for Plate No. 600.

Plate No. 604—Furnish (and install) where shown on the drawings, a "Jiffy" Fire Hose Cabinet, No. 604, constructed of No. 16 gage steel, with No. 12 gage steel trim and door having polished plate glass panel, concealed hinges, concealed catch and pull handle. Finished at factory with a priming coat of white paint.

Furnish (and install) a 2½-in. nickelplated polished brass gate valve, nickelplated brass milled wheel, nickelplated brass cap and chain, having Local Fire Department thread.

Furnish (and install) a 1½-in. nickelplated polished brass gate valve, nickelplated brass milled wheel with ¼-in. drip cock.

Furnish (and attach) a "Jiffy" Type A nickelplated polished brass hose rack with 50 ft. 1½-in. St. Regis Brand Underwriters' Labeled Unlined linen hose.

Furnish (and attach) a 1½x10-in. nickelplated polished brass hose nozzle and nickelplated polished brass couplings.

Plate No. 605—Furnish (and install) where shown on the drawings, a "Jiffy" Fire Hose Cabinet, No. 605, constructed of No. 16 gage steel, with No. 12 gage steel trim and door having polished plate glass panel, concealed hinges, concealed catch and pull handle. Finished at factory with a priming coat of white paint.

Furnish (and install) a "Jiffy" Chemical Fire Extinguisher, No. 710, complete with charge, and Fire Axe with necessary brackets securely mounted.

Note: For balance of equipment shown on Plate No. 605 use the last four paragraphs of specification for Plate No. 604.

Specifications for "Jiffy" Fire Extinguisher Cabinets

Plate No. 602—Furnish (and install) where shown on the drawings, a "Jiffy" Recessed Plate, No. 602, Fire Extinguisher Cabinet, constructed of No. 16 gage steel with No. 12 gage steel trim and door having a polished plate glass panel, concealed hinges, concealed catch and pull handle. Finished at factory with a priming coat of white paint.

Furnish (and install) a "Jiffy" Chemical Fire Extinguisher, No. 710, complete with charge.

Jiffy Cabinet No. 606

Made in two panels of one-piece sheet steel. The trim has a return bend which allows the plaster to be brought against it. It conceals your fire equipment and at the same time adds distinction to the surroundings. There is a small glass panel on which the words "Fire Hose" in red letters should be placed.

For details, specifications and dimensions refer to cabinets 600-601-604 and 605.

bucket tanks, spanner wrenches, play pipes, nozzles, etc., always carried in stock.

Siamese Connections

As Siamese connections are placed on the exterior of buildings, they should be ornamental and attractive. We offer our Figs. 610 and 615 for your consideration.

JOHN SIMMONS CO.

Fire Extinguishing Equipment

102-110 Centre Street, NEW YORK, N. Y.

Products

FIRE EXTINGUISHING EQUIPMENT, for the protection of hotels, office buildings, apartments, theatres, factories and mills, including Hose Cabinets, Hose Racks, Siam-ese Connections and Fire Extinguishers of all types.

Also Hose, Hose Couplings, Valves, Nozzles, Span-ners, Axes, Crowbars, Fire Hooks, Fire Pails, Sprinkler Heads and Hydrants.

Organization and Service

The JOHN SIMMONS Co. have specialized in the Fire Fighting Equipment field for the past 50 years and are thoroughly versed in the specifications of the National Board of Fire Underwriters as well as requirements of local fire department and fire prevention bureaus.

A competent Engineering Department will co-operate with architects planning and selecting apparatus.

Simmons Hose Cabinets

Simmons Hose Cabinets are neat, compact, strong and rigid in construction and made of sheet steel with plate glass door, brass hardware and automatic door catches. Can also be made in wood or with brass door and frame and finished to match any trim. Cabinets are finished with factory prime coat paint or any desired finish can be furnished at slight additional cost.

No. 127 Hose Cabinet—With Extinguisher and Axe

This cabinet is largely specified by architects and engineers for apartment houses, office buildings, theatres and schools. Made from sheet steel with D.D.A. glass door, brass hardware and automatic door catch. It is furnished complete with Josico hose rack, 2½-gal. fire extinguisher, pick-head fire axe and spanner.

No. 126 Hose Cabinet—Without Extinguisher and Axe

This cabinet is similar to our No. 127 less the fire extinguisher, axe and spanner. Furnished with Josico hose rack.

No. 127 Hose Cabinet

Specifications

No. 127 Hose Cabinet—Furnish (and install) as designated on plans:

A Simmons Sheet Steel No. 127 Hose and Extinguisher Cabinet constructed of No. 16 gauge sheet steel with No. 12 gauge steel trim and door having [D.D.A. glass panel] [¼-in. polished plate glass panel] lettered FIRE HOSE; concealed hinges; concealed catch and pull handle. Cabinet to be finished with [four coats baked enamel] [factory prime coat paint—finish to be applied by others].

Equipment—Furnish (and install) one 2½-gal. [nickelplated] [polished copper] [chromium plated] Josico No. 168 [Soda-Acid] [Foam Type] Fire Ex-

tinguisher complete with charge, and one [pick] [flat] head Fire Axe with necessary brackets securely mounted.

Note: For remainder of equipment see specifications of equipment in Hose Cabinet No. 126.

No. 126 Hose Cabinet—Furnish (and install) as designated on plans:

A Simmons Sheet Steel No. 126 Hose Cabinet constructed of No. 16 gauge sheet steel with No. 12 gauge steel trim and door having [D.D.A. glass panel] [¼-in. polished plate glass panel] lettered FIRE HOSE; concealed hinges; concealed catch and pull handle. Cabinet to be finished with [four coats baked enamel] [factory prime coat paint—finish to be applied by others].

Equipment—Furnish (and install):

One [2½] [2] [1½] [1¼] in. [nickelplated] [chromium plated] [polished body] [rough body] Simmons brass angle hose valve with [brass] [red iron] wheel.

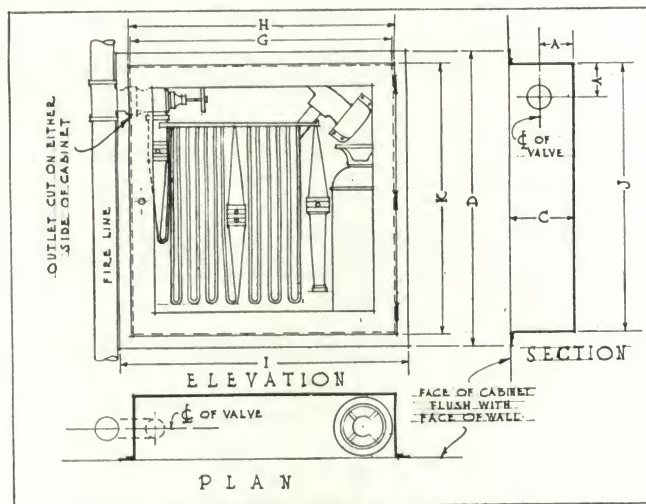

One Josico No. 130 [aluminum finish on iron] [enameled iron] [nickelplated iron] [chromium plated iron] [polished brass] [nickelplated brass] hose rack with rack nipple.

One [50] [75] [100] ft. length [2½] [2] [1½] [1¼] in. Underwriters' [Green] [Yellow] labeled, unlined, linen fire hose.

One [2½x15] [2½x12] [2x11] [1½x10] [1¼x10] in. [brass] [iron] hose nozzle.

Note: Finish on coupling and nozzle to be (polished brass) (match finish on the [rack] [valve]).

One Galvanized Tabor hose spanner.

Josico Swinging Hose Racks

No. 130 Nipple Attachment Type—Chief among the features of this hose rack are neat appearance, durability and simplicity of operation. It is very compact and requires less wall space than the average hose holding device on the market. They are accurately and strongly constructed of either cast gray iron, heavily galvanized, or brass.

No. 130 Josico Nipple Attachment Type

No. 131 Josico Pipe Clamp Support Type

No. 131 Pipe Clamp Type—This rack is of the same construction and includes the same features as our No. 130 above but is equipped with pipe clamp attachment. Clamp can be furnished to fit any size pipe from 1¼ up to 4 in. Larger size clamp can be furnished at additional charge. This rack is also equipped with plates for hanging on wall.

Specifications for Hose Racks

No. 130 Nipple Attachment Type—Furnish (and install) as designated on plans:

One [2½] [2] [1½] [1¼] in. [nickelplated] [chromium plated] [polished body] [rough body] Simmons brass angle hose valve with [brass] [red iron] wheel.

One Josico No. 130 [aluminum finish on iron] [enameled iron] [nickelplated iron] [chromium plated iron] [polished brass] [nickelplated brass] hose rack with rack nipple.

One [50] [75] [100] ft. length [2½] [2] [1½] [1¼] in. Underwriters' [Green] [Yellow] labeled, unlined, linen fire hose. One [2½x15] [2½x12] [2x11] [1½x10] [1¼x10] in. [brass] [iron] hose nozzle.

Note: Finish on coupling and nozzle to be (polished brass) (match finish on the [rack] [valve]).

One Galvanized Tabor hose spanner.

No. 131 Pipe Clamp Type—Same as for No. 130 rack, except:

One Josico No. 131 [aluminum finish on iron] [enameled iron] [nickelplated iron] [chromium plated iron] [polished brass] [nickelplated brass] hose rack with [wall plate] [pipe clamp].

Note: Specify size of pipe that clamps are to fit.

Fire Department Hose Outlet Manifold

This manifold is designed for use on the top of the standpipe riser on the roof or on any setback for ease and efficiency in fighting roof fires or fires in adjoining buildings.

It is equipped with three outlets having approved type hose valves attached thereto.

The outlets are spaced 90° apart for achieving the maximum efficiency in laying a line of hose in any direction with a minimum of sharp bends in the hose.

It is made for 6 or 8-in. riser systems.

No. 165 Simmons Roof Manifold

Siamese Connections

No. 107 Wall Type—Accurately and neatly made of brass, rough or polished. Used for standpipe and sprinkler work. Plates can be made with different lettering. Approved by National Board of Fire Underwriters and New York Fire Department.

No. 106 Sidewalk Type—Used for standpipe coming through sidewalk. Made with double checks, complete with plugs and chain. Neatly made of brass with either rough body, painted with finished trimmings, finished all over, bronzed to match sample or any other finish required. Guaranteed tested to 300 lb. Approved by the New York Fire Department.

No. 168 Josico Fire Extinguisher (Soda and Acid Type)

This 2½-gal. open bottle style owes its widespread popularity to the special attention and supervision given its construction. Body consists of heavy jacketed copper cylinder, specially riveted. All parts carefully finished. Guaranteed tested 350-lb. pressure.

It is thoroughly in accordance with specifications of Underwriters' Laboratories, Inc., besides having the approval of leading fire authorities throughout the country.

For ordinary occupancy one Josico No. 168 Fire Extinguisher is required for every 2500 sq. ft. of floor area. Installation must be such that one extinguisher is available within 35 ft.

WIRT & KNOX MFG. CO.

Manufacturers of Fire Hose Racks and Cabinets
2355-2366 Sedgley Avenue, PHILADELPHIA, PA.

Products

WIRT'S "ROYAL" HOSE RACK; DeLuxe and PLATE AA STEEL HOSE CABINETS; HOSE CARTS, HOSE REELS.

Also a most complete line of Fire Fighting Equipment for all types of buildings, including Extinguisher Cabinets, Siamese, Valves, Couplings, Nozzles, Hose House Equipment, all kinds of Fire Hose and special Fire Fighting Apparatus.

Experience—Dependability

Wirt's Fire Fighting Apparatus has been considered the standard of efficiency and dependability by responsible authorities for fifty years, pioneering the field in which it now leads.

It is made only of the highest grade enduring materials; malleable iron, steel and brass. Gray iron is never used in Wirt's Fire Apparatus. While adhering to this policy for so long we have constantly improved our apparatus to fill the modern requirements of the architect, engineer and owner.

The thousands of Wirt's Fire Hose installations throughout the world on both land and sea bear mute testimony to their durability and efficiency. Therefore, we offer here only the best obtainable and invite an actual comparison of our products with others to determine their superiority.

Wirt's Steel Hose Cabinets (Type AA)

Plate AA. Wirt's Steel Cabinet

The cabinets are neat in design, harmonizing with any style of architecture. The trim and door are made of No. 12 gauge steel and box portion of No. 18 gauge. There are no joints on face of door or trim and there is no rattle when door is opened and closed. The door has a flange or lap which laps over the box part of the cabinet, thus forming a great protection from dust and moisture.

*These cabinets are made to take a 2 1/2-gal. soda and acid fire extinguisher in addition to the hose, making a very complete outfit.

Note: If so specified, Nos. 7S, 8S and 9S cabinets can be made 5 1/2 in. in depth where 1 1/2-in. valve is used, and 6 in. in depth where 2-in. valve is used, otherwise regulation depth of 7 1/2 in. will be furnished.

Wirt's Royal Hose Rack as Used in De Luxe Cabinets and Plate AA Cabinets

Plate A. Royal Rack

The Royal Rack is a covered top rack and was the first on the market. This feature, originated by us, has been copied by most all other makers of hose racks—the advantages of the covered top are well known.

Attached Pins—Pins are permanently attached. They do not fall to the floor when the hose is removed but remain hanging ready for the hose to be replaced.

Semiautomatic—It is operated by first opening the valve and then running off the hose, making it easy for one man to put the hose into play without assistance.

Foolproof—If the valve is maliciously opened the water is held back, thus preventing the flooding of the building.

Preserves Hose—The covered top prevents dust from accumulating on the hose and rotting the linen fibres.

Sizes and Weights—Measurements and weights given below are those of the Royal Rack for 75 ft. of 1 1/2-in. hose with 2 1/2-in. nipple which is featured in specifications given in our folder C. Other sizes of the Royal Rack are equally comparable.

A—3 3/8 In.—Wider than others, always malleable iron or brass—greater width or depth here prevents dipping of rack.

B—1 1/2 In.—Wider or deeper than other—better appearance, better protection.

C—17 1/8 In.—Over-all length usually greater, assures freedom of pins for rapid movement.

D—16 Gauge—This is double cold rolled steel or brass—heavier than others and better quality.

E—5 1/2 In.—

Rack nipple is longer and heavier than others.

Weights: iron 3 1/2 lb., brass 4 lb. 6 oz.

F—4 1/2 In.—

Long—Pins are 1/8-in. diameter and heavier than others. Note particularly mechanical design of pin, free working and compact.

Wirt's Siamese or Steamer Connections

No large building with an inside standpipe system is complete without a steamer connection. It is connected with the standpipe so that the fire engines can pump into the system in case of fire.

All our steamer connections are made of brass, highly polished, and present a handsome appearance. The Plate S1 is particularly attractive and will add to the outside appearance of any building.

All Siamese are equipped with Clapper valves, with either single or double Clapper as ordered, and with caps and chains.

Plate S1

Plate S3
With Sill Cock

Wirt's De Luxe Cabinet

In the design and construction of the De Luxe Fire Hose Cabinet we have taken into consideration the most important factor—safeguarding the fire hose equipment—assuring its perfect manipulation during an emergency. Although made in several different types, including full plate glass door and two-

Wirt's De Luxe Combination Fire Hose Cabinet (Plate TX)

Showing Wirt's Royal Rack with fire hose and extinguisher

panel steel door, the one recommended is our Plate T with two-panel door, the lower panel of steel and upper panel of polished beveled plate glass with the lap door. (See sectional view.)

Although the De Luxe Cabinet can be furnished with the flush type door we strongly recommend the lap door as the advantages are very pronounced.

All De Luxe cabinets are constructed with trim and door front cut from one solid piece of No. 12 gauge sheet steel, no corner seams, welds or brazing. The doors are built up to $\frac{3}{4}$ in. thick with heavy steel covered wood, similar to kalamein but with heavy wrought steel No. 12 gauge front, No. 16 gauge back, not lightweight so-called furniture steel—so there is no rattle when door is opened and closed. Door in addition to fitting into the cabinet, has a flange or lap which laps over the box part of

Sectional View Showing Sturdy Construction of Wirt's De Luxe Cabinet

Very light gauge or furniture steel not used in Wirt's cabinets

Wirt's De Luxe Fire Hose Cabinet (Plate G)

Wirt's De Luxe Fire Hose Cabinet (Plate T)

the cabinet, thus forming a double protection from dust and moisture. This door will not sag because of its construction and three heavy ball head hinges. Trim has $\frac{3}{4}$ -in. return bend.

Width of door trim $2\frac{1}{2}$ in., width of box trim $2\frac{1}{2}$ in., door lap $\frac{1}{2}$ in. over trim.

Box portion of cabinet formed of No. 18 gauge steel, except larger sizes which are No. 16 gauge. Door hinged on heavy ball head brass hinges and equipped with brass pull knob and bullet catch. Plate glass held in place by $\frac{1}{2}$ in. hollow steel moulding.

Door hinging: all hinges on right-hand side as illustrated, unless otherwise ordered. As door swings clear of opening the standard hinging can be used under almost all conditions.

Inlet holes are scorified on both sides of cabinet, either side can be used. The standard placing of holes is C/L 4 in. down from the top (inside) and 4 in. from back.

Clearance between door and trim $\frac{1}{2}$ in. when door is open. If trim is set on face of plaster $\frac{1}{2}$ -in. clearance obtained is enough for most marble wainscoting. Trims can be narrowed if ordered special.

Wirt's De Luxe Fire Hose Cabinet (Plate M)

De Luxe Style, Type F Extinguisher Cabinet

De Luxe Style, Type E Extinguisher Cabinet

The various styles of doors as furnished on Wirt's De Luxe Cabinets afford a hose cabinet that would meet the requirements of any local fire prevention law covering this item.

Estimates and Information

Complete details, specifications, estimates, blue prints, catalogues will gladly be furnished on application.

See copy of our Folder "C" in your files. A1A-29c2.

DIMENSIONS

Type E or F Extinguisher Cabinet			12	27	8 $\frac{1}{2}$	13 $\frac{1}{2}$	28 $\frac{1}{2}$	8 $\frac{3}{8}$

*These cabinets are made to take a 2 $\frac{1}{2}$ -gal. soda and acid fire extinguisher in addition to the hose, making a very complete outfit.

Note: If so specified numbers 7T, 8T and 9T cabinets can be made 6 in. in depth where 1 $\frac{1}{2}$ -in. valve is used and 6 $\frac{1}{2}$ in. in depth where 2-in. valve is used, otherwise regulation depth of 8 in. will be furnished.

De Luxe Cabinet should be placed in wall before the finishing coat of plaster is applied and plaster worked up to edge of the cabinet, allowing about $\frac{3}{8}$ in. to extend beyond the finished plaster line.

THE PHISTER MANUFACTURING COMPANY

Manufacturers of Fire Fighting Equipment

901-903 Broadway, CINCINNATI, OHIO

Products

FIRE HOSE CABINET EQUIPMENT for all types of buildings.

Advantages

Phister Fire Hose Reels are a distinct improvement in the method of storing and protecting fire hose when not in use. Being wound on a reel in an uninked continuous coil, the hose does not deteriorate appreciably over the years and is instantly available for use when needed. The reel operates on a double swivel joint and therefore hose can easily be pulled off in any direction.

Cabinet Information

Phister Hose Cabinets are made to accommodate every possible combination and arrangement of hose

PHISTER COMBINATION HOSE REEL AND CABINET UNIT—MODEL "A"

For This Unit Specify—Phister Combination Hose Reel and Cabinet Model "A." State size and weight of valve—(Standard for pressure up to 150 lb. and Extra Heavy for pressure up to 250 lb.). Give length and diameter of hose, and state whether First Grade Underwriters' Labeled Long Fibre Linen Hose, or Flax Tow Underwriters' Labeled Linen Hose. State finish of valve, nozzle and couplings. Specify whether DS-A., or plate glass in door.

PHISTER COMBINATION HOSE REEL AND CABINET UNIT—MODEL "B"

For This Unit Specify—Phister Combination Hose Reel and Cabinet Model "B." State size and weight of valve—(Standard for pressure up to 150 lb. and Extra Heavy for pressure up to 250 lb.). Give length and diameter of hose, and state whether First Grade Underwriters' Labeled Long Fibre Linen Hose, or Flax Tow Underwriters' Labeled Linen Hose. State whether axe and spanner are required. State whether fire extinguisher is required. State finish of valve, nozzle

and valve sizes. These cabinets are substantially made of heavy steel, the face or trim being cut from a single sheet, and there are no unsightly welded joints at the corners. The doors are also cut from one piece of steel which makes them unusually stiff and strong. The hinges are amply heavy to carry the doors without any sagging. This insures fitting properly in place. A friction catch which is simple and positive is used.

Finish of Cabinets—Unless otherwise specified cabinets will be finished in flat white prime coat and with DS-A glass in the doors. Special finishes can be furnished if required, at small extra cost, but on account of the likelihood of damage in shipping and handling and also the difficulty in many cases to secure a satisfactory match, we recommend the flat white prime coat, so that the interior decorator may finish them properly to fit in with the surroundings.

Note: Standard finish of cabinet is flat white (see cabinet information). Duo panel doors can be furnished in this model if desired. Hose rack can be furnished instead of reel if desired.

This cabinet permits of combinations of valve and hose sizes as listed in table. It is frequently desirable to provide a valve for fire department use and at the same time have a hose small enough to be used by occupants of the building; this can be easily accomplished in this unit by specifying a 2½-in. valve with local fire department thread, and the desired size and length of small hose with reducing coupling.

and couplings. Specify whether DS-A., or plate glass in door.

Note: Standard finish of cabinet is flat white (see cabinet information). Duo panel doors can be furnished in this model if desired. Hose rack can be furnished instead of reel if desired.

This cabinet permits of combinations of valve and hose sizes as listed in table. It is frequently desirable to provide a valve for fire department use and at the same time have a hose small enough to be used by occupants of the building. This can be easily accomplished in this unit by specifying a 2½-in. valve with local fire department thread, and the desired size and length of small hose with reducing coupling.

PHISTER COMBINATION HOSE REEL AND CABINET UNIT—MODEL "C"

For This Unit Specify—Phister Combination Hose Reel and Cabinet Model "C." State size of valve (not larger than standard weight $1\frac{1}{2}$ in.). Give length and diameter of hose, and state whether First Grade Underwriters' Labeled Long Fibre Linen Hose, or Flax

Tow Underwriters' Labeled Linen Hose. State finish of valve, nozzle and couplings. Specify whether DS-A, or plate glass in door.

Note: Standard finish of cabinet is flat white (see cabinet information). Duo panel doors can be furnished in this model if desired. Hose rack can be furnished instead of reel if desired.

Special Note: This model is especially designed for use in shallow walls and is very popular in residences. (See table for valve sizes and hose lengths.) You will note from the table that the wall opening has a depth of only $4\frac{1}{2}$ in.

**DIMENSIONS OF MODEL "C"**

PHISTER COMBINATION HOSE REEL AND CABINET UNIT—MODEL "D"

For This Unit Specify—Phister Combination Hose Reel and Cabinet Model "D." State size and weight valves (Standard for pressure up to 150 lb., and

Extra Heavy for pressure up to 250 lb.). Specify threads for $2\frac{1}{2}$ -in. valve by name of the city where it is to be used. Give length and diameter of hose, and state whether First Grade Underwriters' Labeled Long Fibre Linen Hose, or Flax Tow Underwriters' Labeled Linen Hose. State finish of valve, nozzle and couplings. Specify whether DS-A, or plate glass in door. State whether axe and spanner are required.

Note: Standard finish of cabinet is flat white (see cabinet information). Duo panel doors can be furnished in this model if desired. Hose rack can be furnished instead of reel if desired.

DIMENSIONS OF MODEL "D"

**PHISTER COMBINATION HOSE REEL AND CABINET UNIT—MODEL "E"**
(CHICAGO STANDARD)

For This Unit Specify—Phister Combination Hose Reel and Cabinet Model "E." State size and weight valves (Standard for pressure up to 150 lb. and Extra Heavy for pressure up to 250 lb.). Specify threads for $2\frac{1}{2}$ -in. valve by the name of the city where it is to

be used. Give length and diameter of hose, and state whether First Grade Underwriters' Labeled Long Fibre Linen Hose, or Flax Tow Underwriters' Labeled Linen Hose. Specify whether axe and spanner are required. Specify whether Phister, Underwriters' approved, $2\frac{1}{2}$ -gal. Fire Extinguisher is desired. State finish of valve, nozzle and couplings. Specify whether DS-A, or plate glass in door.

Note: Standard finish of cabinet is flat white (see cabinet information). Duo panel doors can be furnished in this model if desired. Hose rack can be furnished instead of reel if desired.

**HOSE UNIT REQUIREMENTS**

For Buildings Less than Five Stories High—The usual recommendation is a $1\frac{1}{2}$ -in. valve with proper length of $1\frac{1}{2}$ -in. hose attached.

For Buildings Five Stories or Higher—The

usual recommendation is to provide a $2\frac{1}{2}$ -in. valve for use of the local fire department, and a $1\frac{1}{2}$ -in. hose for use of the occupants of the building, this hose to be attached to the $2\frac{1}{2}$ -in. valve by a reducing coupling.

SIAMESE CONNECTIONS, FIRE EXTINGUISHERS, FIRE EXTINGUISHER CABINETS

Flush Type Siamese

Plate No. 166-P shown here is built into the wall and the wall plate is attached by simply screwing in the bronze inlet nipples to which the independent clapper valves are attached. This feature permits the clapper valves to be easily removed for repairs if any trouble should develop. This siamese can be furnished with pipe coming in from bottom instead of back if desired. Blue prints on request.

Dimensions of Plate No. 166-P—Height 9½ in. Other dimension same as Plate No. 165-P shown below.

Plate 166-P

Flush Type Siamese with Sill Cock

Plate 165-P

Plate No. 165-P shown here is exactly the same in construction as Plate No. 166-P shown above with the exception of the sill cock.

DIMENSIONS, IN., PLATE 165-P SIAMESE (4x2½x2½ In.)

A	B	C	D	E	F	*G	H
16	15	7½	12	6¼	4¼	9½	5½

Plate 165-P (6x2½x2½ In.)

A	B	C	D	E	F	*G	H
16	15	7½	12	6½	4¼	9½	7½

*Height of body in wall.

Plate 155-P

Combination Wall Plate Siamese with Sill Cock

Plate No. 155-P, shown here is made of highly polished bronze and is fitted with two 2½-in. fire department inlets and one 4 or 6-in. outlet. Has double clapper valves, plugs and chains, also ¾-in. or 1-in. outlet at bottom for sprinkling hose. Complete with hose cap, chain and key.

Greatest length 19 in.
Greatest width 12½ in.
Extends from wall 10½ in.
Center of pipe opening to center of sill cock
With 4-in. pipe... 9½ in.
With 6-in. pipe... 10 in.

156-P

Wall Plate Siamese

Plate No. 156-P. Same as Plate 155-P shown above, except without sill cock.

Greatest height 11½ in.
Greatest width 12½ in.
Extends from wall 10½ in.

Phister Model S. P.

This type of construction can be furnished when cabinets are not required.

For This Specify—Phister Model S. P. State size and weight of valve. State length, diameter and grade of hose. State finish of valve, nozzle and couplings.

Phister Model 45-P

These hose racks are made of one piece of heavy furniture steel which, in addition to making a very strong support for the pins, also reinforces the entire rack.

These racks can be furnished in any Phister Cabinet Unit instead of the reel if desired.

Phister Extinguisher Cabinets

These cabinets are recessed type, made of heavy steel with glass door and finished edges. They will accommodate a 2½-gal. soda-acid or foam fire extinguisher. Standard finish is flat white prime coat. Wall opening 11 in. wide, 28 in. high, 8⅜ in. deep. Specify by name.

Phister Fire Extinguishers

We manufacture a complete line of high grade chemical fire extinguishers.

Frequently city ordinances call for the installation of 2½-gal. soda-acid extinguishers which may be used in hose cabinets, or hung by brackets on the wall. For ordinary buildings, such as hotels, office buildings and the like, one extinguisher for every 2500 ft. of floor space is required.
